		Total 1	revenue		•••	•••	£8,866	0	0

Expenditure.

A renewal fund of £8,000 will be required to meet the decay of timber work to the value of £94,000, as in the case of the low-level race.

The same contingencies as to competition with a Pumping Company, and as to the low-lying batteries not using the water, apply to this race as well as to the low level.

Should either of these contingencies happen, the yearly loss would be increased to £9,059 in the

one case, and to £8,717 in the other.

In the above estimates no account has been taken of new mines being opened when the supply of water is improved, or the present mines extending their workings, thus increasing the revenue without increasing the expenditure of the races. Undoubtedly there would, be some increase of work at the mines, but the amount of it must be purely speculative. The most sanguine of the managers who has expressed an opinion on the subject, thinks the number of mines would be doubled; the less sanguine think that the present workings would be extended, but that the number of mines would not be increased to any extent. It will be well to examine the result if the extreme opinion that the work would be doubled proved correct; assuming, also, that all the companies, both old and new, used water from the races both for motive power and the tables. This will show what, in the opinion of the most hopeful, might occur.

LOW-LEVEL RACE.

On supposition that work at the mines was doubled by increased facilities due to the supply of pure water.
