

$$\frac{\text{Area}}{\text{Perimeter}} = \frac{25}{26} \quad \begin{array}{l} \text{Log. } 25 = 1.3979400 \\ \text{Perimeter } 26 = 1.3010300 \end{array}$$

$$2)0.0969100 = 1.25, \text{ mean depth.}$$

$$0.0484550 = 1.118 \sqrt{\text{mean depth.}}$$

$$\begin{array}{l} \text{Area, 25 ft.} \quad \text{Log. } 1.3979400 \\ \sqrt{\text{mean depth}} = 1.118 \quad \text{Perimeter } 26 = 1.3010300 \end{array}$$

$$1.4463950 = 27.951 \text{ square feet.}$$

$$\frac{\text{Area } 43.528}{\text{Perimeter } 26.3904} \quad \begin{array}{l} \text{Log. } 1.6387640 \\ \text{Perimeter } 26.3904 = 1.4214394 \end{array}$$

$$2)0.2173246 = 1.6494 \text{ mean depth.}$$

$$0.1086623 = 1.2843 \sqrt{\text{mean depth.}}$$

$$\begin{array}{l} \text{Area } 43.528 \quad \text{Log. } 1.6387640 \\ \sqrt{\text{mean depth}} 1.2843 \quad \text{Perimeter } 26.3904 = 1.4214394 \end{array}$$

$$1.7474263 = 55.902 \text{ square feet.}$$

Now, as 27.951 : 55.902 :: 10,000 : 20,000.

So that both the above rules show that if an airway 5 ft. $\times$ 5 ft. = 25 square feet sectional area, and 6,000 ft. long circulates 10,000 cubic feet of air, an airway 6.5976 ft. $\times$ 6.5976 ft. = 43.528 square feet sectional area, and 6,000 ft. long will circulate double the quantity or 20,000 cubic feet, always provided that the circulating-pressure is the same in both cases.

The formula 113 A $\sqrt{RS}$ will also show that the larger of the two airways referred to will carry twice the quantity of the others. Airway, 5 ft. $\times$ 5 ft. = 25 square feet, 6,000 ft. long, with 2 in. on water-gauge (or 10.4 lb. per square foot).

Formula No. 2.

$$\text{Area, 5 ft. } \times \text{ 5 ft.} = 25 \text{ square feet} = A.$$

$$\frac{\text{Area}}{\text{Perimeter}} = \frac{25}{26} = 1.25 \quad \text{Perimeter } 26 = 1.3010300 = R.$$

$$\frac{\text{Pressure}}{\text{Length}} = \frac{10.4}{6,000} = 0.0017333 = S.$$

$$\sqrt{RS} = \sqrt{1.25 \times 0.0017333} = 0.046547$$

$$\sqrt{RS} = 0.046547 \text{ Log. } = 2.6678960$$

$$113 \quad \text{Perimeter } 26 = 1.3010300$$

$$\text{Area, } 25 \quad \text{Log. } 1.3979400$$

$$\text{Seconds in a minute, } 60 \quad \text{Log. } 1.7781513$$

$$3.8970657 = 7,889.9 \text{ cubic feet.}$$

Say, 7,890 cubic feet per minute.

Formula No. 2.

Airway, 6.5976 ft. $\times$ 6.5976 ft. = 43.528 square feet, 6,000 ft. long, with 2 in. on water-gauge (or 10.4 lb. per square foot).

$$\text{Area, } 6.5976 \times 6.5976 = 43.528 \text{ square feet} = A.$$

$$\frac{\text{Area}}{\text{Perimeter}} = \frac{43.528}{26.3904} = 1.6494 \quad \text{Perimeter } 26.3904 = 1.4214394 = R.$$

$$\frac{\text{Pressure}}{\text{Length}} = \frac{10.4}{6,000} = 0.0017333 \quad \text{Pressure } 10.4 = 1.0043214 = S.$$

$$\sqrt{RS} = \sqrt{1.6494 \times 0.0017333} = 0.053469$$

$$\sqrt{RS} = 0.053469 \text{ Log. } 2.7281033$$

$$113 \quad \text{Perimeter } 26.3904 = 1.4214394$$

$$\text{Area, } 43.528 \quad \text{Log. } 1.6387640$$

$$\text{Seconds in minute, } 60 \quad \text{Log. } 1.7781513$$

$$4.1980970 = 15,780 \text{ cubic feet.}$$

15,780 cubic feet per minute.

The carrying-capacity of the larger airway is twice the carrying-capacity of the other.

At page 142 of the "Miners' Guide" a rule is given to find the size of a rectangular airway equal to square airways (that is, equal in carrying-capacity). The question worked out is, What would be the width of a rectangular airway 7 ft. in height equal in carrying-capacity to a square
