SESSION II.
1912.
NEW ZEALAND.

EDUCATION COMMISSION

(REPORT OF), TOGETHER WITH MINUTES OF PROCEEDINGS AND EVIDENCE.

Presented to both Houses of the General Assembly by Command of His Excellency.

COMMISSION

TO INQUIRE INTO AND REPORT ON CERTAIN MATTERS RELATING TO THE SYSTEM OF EDUCATION IN NEW ZEALAND.

ISLINGTON, Governor.

To all to whom these presents shall come, and to Mark Cohen, Esquire, of Dunedin; William Davidson, Esquire, of Dunedin; James Robert Kirk, Esquire, of Gisborne; Frederick Pirani, Esquire, of Feilding; Hugh Poland, Esquire, M.P., of Paeroa; John Charles Thomson, Esquire, M.P., of Riverton; Thomas Umfrey Wells, Esquire, M.A., of Auckland: Greeting.

WHEREAS it is deemed expedient to appoint a Commission to inquire into and report upon the system of education in New Zealand, and the necessity or expediency of further legislation with respect thereto:

Now, therefore, I, John Poynder Dickson-Poynder, Baron Islington, the Governor of the Dominion of New Zealand, in exercise of the powers conferred by the Commissions of Inquiry Act, 1908, and of all other powers and authorities enabling me in this behalf, and acting by and with the advice and consent of the Executive Council of the said Dominion, do hereby constitute and appoint you, the said

MARK COHEN,
WILLIAM DAVIDSON,
JAMES ROBERT KIRK,
FREDERICK PIRANI,
HUGH POLAND,
JOHN CHARLES THOMSON, and
THOMAS UMFREY WELLS

to be a Commission to inquire into and report on the following matters relating to the system of education in New Zealand:—

(1.) The cost of State education in respect to primary, manual, technical, and secondary, and its relation to efficiency;

(2.) The administration of the central Department;
(3.) The powers and rights possessed respectively by Education Boards and other local educational authorities, and whether they should be extended.
(4.) The expenditure on manual and technical instruction, and the question of local responsibility in regard to providing portion of funds therefor;
(5.) The amalgamation of local governing or controlling bodies;
(6.) Overlapping and duplication;
(7.) The finance of Education Boards, high school and manual and technical governing bodies;
(8.) Agricultural instruction and rural courses;
(9.) In what respects school instruction can be improved and made of more practical value in equipping pupils for their future careers;
(10.) Scholarships and free places—what changes, if any, should be made in this direction;
(11.) And generally in what respects improvements can be made to secure higher efficiency, better administration, and co-ordination, and the securing of greater value for the annual expenditure on the branches of education above referred to.

And with the like advice and consent I do further appoint you, the said

MARK COHEN,

to be Chairman of the said Commission.

And for the better enabling you the said Commission to carry these presents into effect you are hereby authorized and empowered to make and conduct any inquiry under these presents at Dunedin, Christchurch, Wellington, and Auckland, and at such times as you deem expedient, with power to adjourn from time to time and from place to place as enumerated as you think fit, and to call before you and examine on oath or otherwise as may be allowed by law such person or persons as you think capable of affording information in the premises, and you are also empowered to call for and examine all such books and records as you deem likely to afford you the fullest information on the subject-matter of the inquiry hereby directed to be made, and to inquire of and concerning the premises by all lawful means whatsoever.

And using all diligence, you are required to report to me under your hands and seals not later than the twenty-fifth day of June, one thousand nine hundred and twelve, your opinion as to the aforesaid matters.

And it is hereby declared that these presents shall continue in full force and virtue although the inquiry is not regularly continued from time to time or from place to place by adjournment.

And, lastly, it is hereby declared that these presents are issued under and subject to the provisions of the Commissions of Inquiry Act, 1908.

Given under the hand of His Excellency the Right Honourable John Poynder Dickson-Poynder, Baron Islington, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this twenty-fourth day of May, in the year of our Lord one thousand nine hundred and twelve.

THOMAS MACKENZIE,
Prime Minister.

Approved in Council.

LEOD. E. JOHNSON,
Acting Clerk of the Executive Council.

EDUCATION COMMISSION: EMPOWERING COMMISSION TO MAKE INQUIRY AT ADDITIONAL PLACES IN AGRICULTURAL DISTRICTS.

ISLINGTON, Governor.

WHEREAS by a Warrant issued under my hand and the Public Seal of the Dominion on the twenty-fourth day of May, one thousand nine hundred and twelve, Mark Cohen, Esquire, William Davidson, Esquire, James Robert Kirk, Esquire, Frederick Pirani, Esquire, Hugh Poland, Esquire, John Charles Thomson, Esquire, and Thomas Umfrey Wells, Esquire, were appointed a Commission for the purpose of inquiring into and reporting on certain matters relating to the system of education in New Zealand: And whereas it is expedient to authorize the said Commission to make and conduct its inquiry at certain places in addition to those named in the said Warrant:

Now, therefore, I, John Poynder Dickson-Poynder, Baron Islington, the Governor of the Dominion of New Zealand, in exercise of the powers conferred by the Commissions of Inquiry Act, 1908, and of all other powers and authorities enabling me in this behalf, and acting by and with the advice and consent of the Executive Council of the said Dominion, do hereby authorize and empower you, the said Mark Cohen, William Davidson, James Robert Kirk, Frederick Pirani, Hugh Poland, John Charles Thomson, and Thomas Umfrey Wells, to make and conduct your inquiry as directed by the said Commission at one town in the North Island and one town in the South Island, as may be selected by you, subject to the condition that each of those towns must be in an agricultural district, in addition to the cities of Dunedin, Christchurch, Wellington, and Auckland, and at such times as you deem expedient, with power to adjourn from time to time and from any such place to any such place as you think fit.

And with the like advice and consent, and in further pursuance of the said powers and authority, I do hereby confirm the said Commission, except as altered by these presents.

Given under the hand of His Excellency the Right Honourable John Poynder Dickson-Poynder, Baron Islington, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this 11th day of June, in the year of our Lord one thousand nine hundred and twelve.

THOMAS MACKENZIE,
Prime Minister.

Approved in Council.

J. F. ANDREWS,
Clerk of the Executive Council.

EDUCATION COMMISSION: EXTENDING PERIOD FOR MAKING REPORT.

ISLINGTON, Governor.

To all to whom these presents shall come, and to Mark Cohen, Esquire, of Dunedin; William Davidson, Esquire, of Dunedin; James Robert Kirk, Esquire, of Gisborne; Frederick Pirani, Esquire, of Feilding; Hugh Poland, Esquire, M.P., of Paeroa; John Charles Thomson, Esquire, M.P., of Riverton; Thomas Umfrey Wells, Esquire, M.A., of Auckland: Greeting.

WHEREAS by Warrants dated the twenty-fourth day of May, one thousand nine hundred and twelve, and the eleventh day of June, one thousand nine hundred and twelve, you the said Mark Cohen, William Davidson, James Robert Kirk, Frederick Pirani, Hugh Poland, John Charles Thomson, and Thomas Umfrey Wells were appointed a Commission for the purpose of inquiring into and reporting on certain matters relating to the system of education in New Zealand: And whereas by the said Warrant dated the twenty-fourth day of May, one thousand nine hundred and twelve, you were required to report to me, under your hands and seals, your opinion as to the aforesaid matters not later than the twenty-fifth day of June, one thousand nine hundred and twelve: And whereas it is expedient that the said period should be extended as hereinafter provided:

Now, therefore, I, John Poynder Dickson-Poynder, Baron Islington, the Governor of the Dominion of New Zealand, in exercise of the powers conferred by

the Commissions of Inquiry Act, 1908, and of all other powers and authorities enabling me in this behalf, and acting by and with the advice and consent of the Executive Council of the said Dominion, do hereby extend the period within which you shall (using all diligence) report to me as by the said Warrant provided to the twenty-fifth day of July, one thousand nine hundred and twelve.

And with the like advice and consent, and in further pursuance of the said powers and authorities, I do hereby confirm the said Commission, except as altered by these presents.

Given under the hand of His Excellency the Right Honourable John Poynder Dickson-Poynder, Baron Islington, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this twenty-fourth day of June, in the year of our Lord, one thousand nine hundred and twelve.

ARTHUR M. MYERS,
For Prime Minister.

Approved in Council.

J. F. ANDREWS,
Clerk of the Executive Council.

EDUCATION COMMISSION: EXTENDING PERIOD FOR MAKING REPORT.

ISLINGTON, Governor.

To all to whom these presents shall come, and to Mark Cohen, Esquire, of Dunedin; Willian Davidson, Esquire, of Dunedin; James Robert Kirk, Esquire, of Gisborne; Frederick Pirani, Esquire, of Feilding; Hugh Poland, Esquire, M.P., of Paeroa; John Charles Thomson, Esquire, M.P., of Riverton; Thomas Umfrey Wells, Esquire, M.A., of Auckland: Greeting.

WHEREAS by Warrants dated the twenty-fourth day of May, one thousand nine hundred and twelve, the eleventh day of June, one thousand and nine hundred and twelve, and the twenty-fourth day of June, one thousand nine hundred and twelve, you, the said Mark Cohen, William Davidson, James Robert Kirk, Frederick Pirani, Hugh Poland, John Charles Thomson, and Thomas Umfrey Wells were appointed a Commission for the purpose of inquiring into and reporting on certain matters relating to the system of education in New Zealand: And whereas by the said Warrant dated the twenty-fourth day of May, one thousand nine hundred and twelve you were required to report to me, under your hands and seals, your opinion as to the aforesaid matters not later than the twenty-fifth day of June, one thousand nine hundred and twelve: And whereas by Warrant dated the twenty-fourth day of June, one thousand nine hundred and twelve, the time in which you were required to report to me was extended to the twenty-fifth day of July, one thousand nine hundred and twelve: And whereas it is expedient that the said period should be further extended as hereinafter provided:

Now, therefore, I, John Poynder Dickson-Poynder, Baron Islington, the Governor of the Dominion of New Zealand, in exercise of the powers conferred by the Commissions of Inquiry Act, 1908, and of all other powers and authorities enabling me in this behalf, and acting by and with the advice and consent of the Executive Council of the said Dominion, do hereby further extend the period within which you shall (using all diligence) report to me as by the said Warrant provided to the thirty-first day of July, one thousand nine hundred and twelve.

And with the like advice and consent and in further pursuance of the said powers and authorities I do hereby confirm the said Commission, except as altered by these presents.

Given under the hand of His Excellency the Right Honourable John Poynder Dickson-Poynder, Baron Islington, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its dependencies; and issued under the Seal of the said Dominion, at the Government House, at Wellington, this twenty-second day of July, in the year of our Lord one thousand nine hundred and twelve.

J. ALLEN,
For Prime Minister.

Approved in Council.

J. F. ANDREWS,
Clerk of the Executive Council.

REPORT.

To His Excellency the Right Honourable John Poynder Dickson-Poynder, Baron Islington, Governor and Commander-in-Chief in and over His Majesty's Dominion of New Zealand and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the Commissioners appointed by Your Excellency's Letters Patent of the 24th May, 1912, which Letters Patent were extended on the 11th June, 1912, and still further extended on the 24th June, 1912, and on the 22nd July, 1912, by which we were directed to inquire into the following matters and things, that is to say,—

(1.) The cost of State education in respect to primary, manual, technical, and secondary, and its relation to efficiency ;
(2.) The administration of the central Department ;
(3.) The powers and rights possessed respectively by Education Boards and other local educational authorities, and whether they should be extended ;
(4.) The expenditure on manual and technical instruction, and the question of local responsibility in regard to providing portion of funds therefor ;
(5.) The amalgamation of local governing or controlling bodies ;
(6.) Overlapping and duplication ;
(7.) The finance of Education Boards, high school and manual and technical governing bodies ;
(8.) Agricultural instruction and rural courses ;
(9.) In what respects school instruction can be improved and made of more practical value in equipping pupils for their future careers ;
(10.) Scholarships and free places—what changes, if any, should be made in this direction ;
(11.) And generally in what respects improvements can be made to secure higher efficiency, better administration, and co-ordination and the securing of greater value for the annual expenditure on the branches of education above referred to ;

have to report as follows :—

For the purpose of obtaining evidence on the matters committed to us we communicated direct with the various educational bodies and associations, and also caused advertisements to be inserted in the newspapers circulating in the localities we proposed to visit, inviting those desirous of giving evidence to appear before us. Sittings were held at Wellington, Auckland, Dunedin, Invercargill, Christchurch, and Wanganui, and every publicity was given, the meetings being held with open doors.

During our inquiries thirty-seven open sittings of the Commission were held, in addition to numerous sittings of Committees. We examined (on oath or by affirmation) 206 witnesses, including the Inspector-General of Schools, representatives of Education Boards and School Committees, Education District Institutes, technical schools and colleges, secondary schools and colleges and training colleges, as well as other persons interested in the different phases of education. Written statements were also received from a number of witnesses who could not attend the sittings of the Commission. The evidence, oral and otherwise, elicited during the inquiry is attached hereto.

In submitting this report, your Commissioners regret that the time at their disposal was not more than sufficient to allow of a hurried visit to the principal centres in each Island and the taking of evidence easily available. A large amount of valuable criticism of the methods and quality of the instruction in our State schools was given by leading educationists and other representative people, enabling the Commission to arrive at the conclusions given in this report. The limit, however, to the number of districts to be visited and the impossibility of obtaining the printed evidence before the presentation of this report will readily explain any apparent oversight in dealing with some questions of importance.

The recommendations of your Commission embody proposals for the revision of the whole system of primary, technical, and secondary education on lines which should give continuity of government from the Minister to the School Committees, retaining the maximum of local interest, while ensuring complete responsibility in every grade of activity. The institution of a Council of Education, five Education Boards, School Boards in the large centres, and School Committees for the scattered districts should be an ideal method of dealing with what we consider is the most important branch of local government in the Dominion, while the proposals for encouraging local contributions to the cost of education, and the protection of the system in the more remote localities, should ensure the establishment of the greatest facilities for carrying on our education system without trenching too largely upon the public purse.

The outstanding weaknesses of the present education system may be enumerated as—

The complexity of the departmental administration ;
The difficulty of securing satisfactory management in small education districts ;
The want of uniformity, aim, and method amongst Inspectors ;
The unsatisfactory methods adopted by most Boards for the appointment and promotion of teachers ;
The indefinite and complicated nature of the syllabus ;
The unsuitability of school buildings and equipment in many instances ;
The inadequate playgrounds ;
The lack of co-ordination between primary and higher branches of education ;
The want of facilities for rural training ; and
The absence of a degree of direct responsibility of the Boards in the expenditure of the moneys entrusted to them.

The commendable features are,—

The devotion to duty shown by the officials ;
The services rendered without pay or reward by the large number of members of the different governing bodies ;
The zeal and high standing of the Inspectors and teachers ;
The considerable measure of success attained in the application of modern methods of education to the problems of everyday life ; and
The readiness of the pupils to take advantage of the system as shown by the high percentage of attendance maintained, particularly in those portions of the Dominion where climatic and other conditions are unfavourable.

Your Commissioners recommend the appointment of a Council of Education, to consist of fifteen members, and to be called " The Council of National Education," for the Dominion of New Zealand.

The following members of the Council to be appointed by the Governor in Council :—

The Minister of Education, who shall be Chairman ;
The Director of Education ;
The Suvervisor of Technical Education ; and
Two representatives of the producing industries of the Dominion :

together with ten other members, who shall be elected as under :—

One by the inspectoral staffs of the several Education Boards of the Dominion ;

One by each of the proposed five Education Boards;
Two by the certificated teachers employed in the primary schools—one to represent the North Island and the other the South Island;
One by the certificated teachers employed in the secondary schools; and
One by the Senate of the University of New Zealand.

The non-official and elective members of the Council to be paid out of the consolidated revenue a sum to cover all travelling-expenses reasonably incurred by them, both in attending the meetings of the Council and transacting the business thereof, together with such sums for each attendance at such meetings as the Governor in Council may from time to time direct.

The powers, duties, and functions of the Council to be,—

(1.) To report to the Minister and advise him upon methods of, or developments in, State education in other countries which in the opinion of the Council can be advantageously introduced into the Dominion.
(2.) To report to the Minister on any question relating to national education.
(3.) To report to the Minister on all questions relating to the administration of national education within the Dominion, as well as to the co-ordination of all branches of such education.
(4.) To prepare a uniform code of regulations (dealing with guiding principles, but omitting details) referring to school curricula, school attendance, the staffing of schools, the classification of teachers; making provision for the payment of Inspectors' and teachers' salaries; for the erection and equipment of schools; for the cost of transferring teachers, and for the conveyance and board of pupils; for grants for scholarships and free places; for the control of training colleges; for the maintenance of higher education; and for the control of other institutions administered by the Department.

The Council to furnish to the Minister for presentation to Parliament a report covering their operations for each year ending the 31st December, such report to be presented to Parliament not later than July, and if Parliament be not then sitting, then within ten days after the commencement of the next ensuing session.

The Council to meet half-yearly, and at such other times as the Minister may direct.

Education Boards.

The Commission recommends the reduction of the number of Education Boards from thirteen to five, the suggested Boards being,—

One Board for the Auckland Education District as at present;
One Board for the Wanganui, Taranaki, and Hawke's Bay Education Districts;
One Board for the Wellington, Nelson, and Marlborough Education Districts;
One Board for the North Canterbury, South Canterbury, Westland, and Grey Education Districts; and
One Board for the Otago and Southland Education Districts.

Each Board to consist of twelve members, elected for three years, from four wards of the district, on adult suffrage.

The Education Boards to have the right of control over primary, technical, and secondary education, as well as Native schools, within their own districts, as far as the powers conferred by legislation on Education Boards, Boards of Governors of secondary schools, and Managers of technical schools are concerned.

It is recommended, on account of the increased duties and responsibilities devolving on the new Education Boards, that Parliament should consider the advisability of granting an annual fixed allowance to the Chairman of such Boards.

The following returns show (A) the schools of each grade in each of the proposed districts, and (B) the average attendance at such schools as at the end of 1911:—

(A.)

NUMBER OF SCHOOLS IN EACH GRADE.

District.	Grade 0.	Grade 1.	Grade 2.	Grade 3.	Grade 4.	Grade 5.	Grade 6 and upwards.	Total.
Auckland	39	115	145	79	118	18	60	574
Middle District of North Island ..	22	66	90	47	109	39	50	423
Wellington	68	75	76	36	68	18	50	391
Canterbury	19	63	78	53	77	30	46	366
Otago	14	74	91	68	90	22	53	412
Total schools	162	393	480	283	462	127	259	2,166

(B.)

AVERAGE ATTENDANCE IN THE SCHOOLS INCLUDED IN RETURN A.

District.	Grade 0.	Grade 1.	Grade 2.	Grade 3.	Grade 4.	Grade 5.	Grade 6 and upwards.	Totals.
Auckland	259	1,496	2,730	2,437	6,185	1,878	21,701	36,686
Middle District of North Island ..	110	790	1,824	1,470	5,547	3,854	14,396	27,991
Wellington	342	861	1,567	981	3,444	1,827	14,553	23,575
Canterbury	117	737	1,557	1,552	3,695	2,938	16,384	26,980
Otago	101	824	2,007	2,008	4,485	2,233	16,741	28,399
Totals	929	4,708	9,685	8,448	23,356	12,730	83,775	143,631

SCHOOL BOARDS.

School Boards, to consist of seven members, should be established in every city or borough with a population of over 8,000, such city or borough to include adjacent boroughs and road districts in its school district, the Board to have control of primary, secondary, and technical education, subject to such control by the Education Board as may be prescribed.

A School Board may be established in a borough having a population of not less than 4,000, or in a county with a population of not less than 4,000, inclusive of boroughs but not School Board districts, within its boundaries, provided a majority of the electors who vote declare in favour of the establishment of such Board at a poll taken by direction of the Education Board at the request of at least one hundred electors.

The funds of the School Boards to consist of a capitation of 5s. for every pupil on the total average weekly roll in all schools (primary, secondary, and technical) within the school district, as well as such grants for maintenance of buildings, and special grants, as may be made by the Education Board; a subsidy paid by the Government of £1 for every £1 raised by voluntary contribution for purposes approved by the Education Board; a Government subsidy of £2 for every £1 raised by local rates or contributed by local bodies for purposes approved by the Education Board; and a Government subsidy of £1 for every £1 donated by bequest for school purposes.

The School Boards should be elected annually before the last day in February by the vote of those enrolled on the municipal or electoral roll, as the case may be.

The right should be conferred upon School Boards to set up Committees for the management of secondary schools or technical schools under their jurisdiction, and to "co-opt" any persons specially qualified to act thereon.

A meeting of the electors of the School Board district to be held annually in February before the election of the Board, at which the reports and balance-sheets of the various schools, and a statement of the administration of the Board shall be read, and motions in connection with Education dealt with.

School Committees.

Where practicable the Education Board should divide that portion of its district which is not within the boundaries of a School Board district into school districts containing not fewer than two schools nor more than ten schools, for which the electors should appoint a Committee. Where it is not practicable to combine two schools in one district, a Commissioner or Commissioners shall be appointed for each school by the Education Board.

The Education Board should prescribe by Regulation (to be approved by the Minister) the duties of and payments to School Committees or Commissioners respectively, as well as the number of members (which should not exceed seven) of each Committee.

The Inspectorate.

It is recommended that Inspectors in each of the proposed five education districts be classified as under :—

(1.) One Chief Inspector, at a salary of £600, rising by £10 yearly increments to £650.
(2.) Two Senior Inspectors, at a salary of £500, rising by £10 yearly increments to £550.
(3.) Inspectors, at a salary of £400, rising by £10 yearly increments to £450.

A uniform rate of travelling-expenses to be paid in addition. Under these proposals no Inspector should receive a salary less than that now paid to him.

The number of Inspectors to be appointed in each education district should be subject to the approval of the Director of Education.

It is strongly recommended that the giving of help in organizing and teaching in schools in charge of inexperienced teachers should be regarded as the most im-important of an Inspector's duties.

In the event of the Native schools being taken over by the Education Boards, the services of the present Native-school Inspectors should be retained.

The Cost of Education.

The total increase in the cost of State education in the Dominion during the last eleven years up to the 31st March, 1911, to the nearest £1,000, amounts to no less a sum than £504,000. This sum is accounted for under the following heads :—

	£
(1.) Primary education	360,000
(2.) Secondary education	78,000
(3.) Technical education	50,000
(4.) Higher education	16,000
	£504,000

In connection with the above statement it is interesting to show the special items of increase : (1.) Of the £360,000, the increased cost of primary education, teachers' salaries account for £244,000, of which sum £68,000 is due to increased attendance ; £156,000 to increases in the rates of salary ; and £20,000 to more liberal staffing and the increased number of small schools—a consequence of the growth of settlement. As showing the attention that has been paid to small country schools it may be pointed out that the average cost per pupil in sole-teacher schools in 1900 was £3 17s. 3d., whereas in 1910 it amounted to £7 0s. 8d., the total increase being nearly £90,000. The average salary paid in all sole-teacher schools in 1910 was £114 16s. 6d., together with house allowance or free house. Your Commis-

sioners believe that much of the objection to the increased charges for education has been due to the fact that a number of items are now included in the total which have really little connection with education in its ordinary sense. For instance, public library subsidies, infant-life protection, schools for the deaf, blind, and backward children, industrial schools, &c., involve an annual expenditure of over £60,000.

There have certainly been great increases in teachers' salaries, in the cost of training teachers, and in the expenditure on school buildings; but no one can justly say that the sums now granted for these purposes are sufficient. The free-place system is mainly responsible for the increase in district high school salaries and the grants to secondary schools and technical schools. The adoption of the Commission's proposals in regard to free places should result in a considerable saving. It will be noticed that there has been a large increase in the cost of administration by the Boards, a great deal of which has been necessitated by the demands of the central Department for returns not commensurate with the advantages gained.

The following table shows the expenditure on the principal items legitimately charged to primary and secondary education for the years 1900 and 1911, respectively:—

	1900. £	1911. £
(1.) Head Office	4,869	18,816
(2.) Education Boards—		
(*a.*) Teachers' salaries and allowances	357,249	627,371
(*b.*) Incidental expenses of schools	32,823	42,830
(*c.*) School buildings	51,805	160,401
(*d.*) Scholarships	8,388	9,616
(*e.*) District high school salaries*	..	17,880
(*f.*) Training of teachers	3,515	28,992
(*g.*) Manual and Technical Instruction	5,201	65,195
(*h.*) Staffs, members' expenses and incidental office expenses	29,231	43,697
(*i.*) Free school-books	Nil	10,187
(3.) *School Journal*	Nil	3,369
(4.) School Cadets	3,240	6,513
(5.) Secondary schools—		
(*a.*) Endowments	34,177	41,285
(*b.*) Government grants	Nil	59,253
(6.) Native schools (including inspection)	20,059	36,154

*Included in "Teachers' salaries" in 1900.

The following return supplies an analysis of the expenditure on education during the past twelve years :—

ANALYSIS OF EXPENDITURE ON EDUCATION IN NEW ZEALAND.
(Figures given in every case to the nearest £1,000.)

—	1900–1.	1901–2.	1902–3.	1903–4.	1904–5.	1905–6.	1906–7.	1907–8.	1908–9.	1909–10.	1910–11.	1911–12.
	£	£	£	£	£	£	£	£	£	£	£	£
A. (1.) Primary (including Native schools and training colleges)	467,000	517,000	542,000	565,000	574,000	611,000	717,000*	736,000	756,000	769,000	844,000	892,000
(2.) Secondary (including secondary schools and secondary departments of district high schools)	3,000	4,000	17,000	26,000	37,000	51,000	68,000	76,000	74,000	80,000	88,000	91,000
(3.) Continuation and technical	5,000	12,000	16,000	23,000	28,000	45,000	54,000	64,000	59,000	58,000	52,000	58,000
(4.) Higher education (including university and higher technical)	12,000	12,000	14,000	12,000	17,000	34,000	41,000	24,000	28,000	39,000	31,000	30,000
Totals, A	487,000	545,000	589,000	626,000	656,000	741,000	880,000	900,000	917,000	946,000	1,015,000	1,071,000
B. Industrial schools	19,000	22,000	27,000	37,000	26,000	31,000	36,000	32,000	39,000	33,000	42,000	40,000
C. Special schools (deaf and blind and home for backward children)	6,000	4,000	6,000	13,000	9,000	8,000	5,000	7,000	17,000	9,000	11,000	8,000

* Principal increases: Teachers' salaries, £30,000; training colleges, £17,000; schoo lbuildings, £31,000; and conveyance of school-children, £5,000.

Administration of Central Department.

The Commission recognizes the efficient manner in which the detail work of the Education Department has been carried out, and that some of the salaries are certainly not commensurate with the ability and zeal of the officers employed. At the same time, it is believed that a very considerable saving will be effected and local control and responsibility be increased by placing upon the new Education Boards many of the duties now carried out by the Department. Amongst these may be enumerated the inspection of secondary schools, of free kindergartens, of manual, technical, and agricultural instruction; provision for the issue of railway passes for pupils and teachers; keeping of maintenance and rebuilding accounts on the basis agreed upon; accounts in reference to and the control of Native schools.

The simplification and (in certain cases) the abolition of returns will reduce enormously the clerical and printing work. For example, instead of the annual returns required to be furnished to the Department by Education Boards and now known as Nos. 1, 2, 3, 6, and 7, all relating to primary and district high schools and salaries, three returns only should be required to be furnished, and these in simplified form, as follows:—

No. 1. (To replace the present Nos. 1 and 2.) Return of Schools, Salaries and Allowances of Teachers, as at the beginning of the Year 191 .

Grade.	Number of Schools open.	Aggregate.	
		Salaries of Teachers, including District High Schools, Pupil-teachers' and Probationers' Allowances.	House Allowances.

No. 2. (To replace No. 3 at present furnished quarterly.) Adjustment in Salaries and Allowances during the Year ending 191 .

Grade.	Number of Schools open.	Amount provided by Department.	Amount paid by Board.	Adjustment with Department.	
				Dr.	Cr.

No. 3. Names, Status, and Emoluments of Teachers on the Staff of Public Schools. (To include all the columns in the present Return No. 7 and column 2 in Return No. 6: the other columns in the last-named return to be done away with.)

Thus in the return published in the annual report and known as Appendix E, containing twelve pages of printed matter, with fifteen columns of information, columns 3 to 10 inclusive would be dispensed with, so reducing the return by more than one-half.

It is estimated that if the reforms here outlined are adopted a saving of approximately £10,000 a year in the administration of the Department could be effected, while the total extra cost to the Boards would probably not exceed one-fifth of that sum.

As the present method of administering the manual and technical instruction in the Dominion lacks uniformity and co-ordination, and is anything but economical, it is recommended that the services of a Supervisor be obtained in order to place this important branch of national education on a satisfactory basis.

The Education Department, as at present constituted, consists of six branches, as follows:—

(1.) The Official Branch;
(2.) The Examination Branch;
(3.) Manual and Technical Instruction Branch;

(4.) The Native Schools Branch;
(5.) School Journal Branch; and
(6.) Industrial and Special Schools Branch.

The reconstitution of the Department is recommended on the following lines:—

(1.) A Director of Education, responsible to the Minister for the general administration of all State education, other than university.
(2.) The Native Schools Branch to be abolished.
(3.) The Minister to appoint such other officers under the Director of Education as may be required for the efficient administration of the Department.

Training of Teachers.

The training colleges as at present constituted are doing good work, but it is suggested that in order to provide an adequate supply of trained teachers the maximum number of students allowed by regulation at each college be increased, and that facilities for giving a wider range of experience be provided by associating with each college a number of teachers at neighbouring schools—selected on account of the excellence of their work—to whom the training-college students should be sent for specified periods for the purpose of observation-work.

It is also urged that candidates for appointment in secondary schools be required to undergo at least one year's training in a training college, and that for the purpose of affording practice in teaching an approved secondary school in the neighbourhood be associated with the training college.

As bearing upon the question of the shortage of teachers, attention has been directed to the fact that suitable candidates for pupil-teachers and probationers are debarred from entering the profession owing to the limitation of the number who may be employed by the Boards. It is therefore recommended that the number of probationers now permitted to be employed be largely increased, and that Education Boards be allowed to allot them to any approved school. If these suggestions are given effect to, it will be unnecessary to comply with the demand made in certain quarters that a number of certificated teachers should be imported from the Old Country.

TEACHERS' SALARIES.

In spite of the fact that the remuneration paid to teachers has been materially increased during the past ten years, there has been a practically unanimous demand throughout the Dominion for an increase in salaries, and it has been very strongly urged that the prizes at present offered are not sufficiently numerous to attract to the profession the most promising young men in the community.

It is recommended that improvements be made by including in Grade X all schools having an average attendance of over 500, and by providing that no certificated teacher in charge of a school above Grade I should be paid less than £150 per annum.

Considerable stress has been laid upon the necessity for defining the position of infant-mistress in the higher-grade schools, and we recommend that the salary attached to such position should not be less than that of the second assistant.

Teachers in the secondary department of district high schools and assistants in secondary schools are at present underpaid. In view of the high qualifications required from these teachers, and of the long course of study thus entailed, it is suggested that, in the event of the control of secondary schools being placed under Education Boards, a Dominion scale of salaries at an increased rate for these teachers be formulated, and that in it the principle of yearly increments be established.

That the special allowance of £30 per annum now made to head teachers of district high schools be discontinued.

No deduction should be made from the salary of a teacher who has qualified for a certificate, but who is under twenty-one years of age.

STAFFING OF SCHOOLS.

It is to be regretted that in many large schools classes of sixty or seventy pupils are in charge of a single teacher. The coming into full operation of the new scale of staffing will remedy the evil to some extent; but even then the ideal of

forty pupils per teacher will not be reached. The following table shows the period that will elapse before the new scale takes full effect :—

Grade.	Number of Schools.	Number of Assistants and Rate of Salary.				
		1912.	1913.	1914.	1915.	1916.

Grading, Promotion, and Examination of Teachers.

Very complete evidence was given in Auckland and Wanganui as to the success of the schemes of grading and promotion adopted in those districts, the main features of which are the prominence given to teaching-ability, to organization, and to attention to the essentials so important in those entrusted with the training of the youth of the Dominion. It was shown that the great majority of the teachers and Committees in the districts mentioned were satisfied that the system was better than the old method of appointment, the evils attaching to canvassing especially being largely avoided, and efficient teachers being ensured fairer opportunities of promotion. Every Education Board should institute a system of grading and promotion of teachers, and at annual conferences of Chief Inspectors applications for transfer of teachers from one education district to another could be dealt with.

In the event of a teacher on the Grading List being superseded by the promotion of another teacher, the former should have the right to appeal against such action to a Committee consisting of a representative of the Education Board concerned, a representative of the teacher, and a Chairman appointed by them. In the event of the appeal being sustained, such teacher shall receive promotion at the earliest possible date.

The attention of your Commission has been drawn to the fact that, on the 13th February of this year, amended Regulations for the Examination and Classification of Teachers were gazetted, and that though by an Order in Council dated the 25th March the coming into operation of these regulations was postponed until the 1st June, 1913, many teachers were put to considerable trouble and expense in consequence of receiving insufficient notice of the proposed change. It is recommended that in future at least twelve months' notice should be given before similar new regulations become operative. It is further recommended that every facility and encouragement should be given to uncertificated teachers to become qualified, by allowing them to take the examination for the D certificate in sections of any three or more subjects in any order in any one year, and that they receive credit for every subject in which they obtain a pass.

Manual and Technical Instruction.

The system of paying Boards capitation on manual work done in schools on the basis of individual attendance on certain days at schools should be abolished, and the Government should substitute as basis the average weekly roll of the schools in the standards in which the instruction is given.

The scale of payment for country classes should be considerably increased. The system of payment for instruction in technical subjects should be revised in the direction of making the payments depend less upon capitation, and thus give the teachers more stable salaries and the managing body security of finance.

By the abolition of district high schools and the diversion of free-place pupils from secondary schools, the attendance at technical schools should increase and their permanence be secured. It should be possible for the Boards to obtain the services of the Agricultural Department's Instructors who could institute occasional classes in veterinary science, wool-classing, bee-keeping, fruitgrowing, &c.

The significance and importance of the fact that in our technical schools the girls greatly outnumber the boys in the commercial classes should not be lost sight of by the community. Secondary schools should not provide for the teaching of shorthand, typewriting, and book-keeping, except the elements of the last-named subject.

The evidence of those in charge of the trade classes in the various technical schools points unmistakably to the advantage of establishing a standard or Dominion examination in the work of such classes. To that end it is suggested that the Council of Education should frame regulations for the issue of certificate of efficient instruction to those apprentices who qualify in such instruction. In the case of plumbers' apprentices, it is especially necessary that the certificate of efficiency and competency to practise as a journeyman that is granted by any one technical college should be recognized throughout the Dominion, and be accepted by the local bodies that register or license plumbers. If this standard examination be established the examinations under the auspices of the London and City Guilds Institute could be dispensed with.

The need for a uniform examination in respect to the teaching of arts and crafts within the Dominion has been emphasized by a number of witnesses, and it is recommended that this proposal be given effect to. Facilities should be afforded for the exhibition at the chief centres of the best work done at such examination.

Continuation Classes.

That so many pupils leave school without passing Standard VI justifies the introduction of compulsory continuation classes in technical schools. The provision made in the Act of 1910, defining "young person" as a boy or girl over the age of fourteen years, but not over the age of seventeen years, and the general provision that no capitation shall be paid in respect to technical-school pupils under fourteen years of age, do not take into account the fact that so many pupils leave school before they attain the age of fourteen years. The onus of proving that employees are exempt from attendance at compulsory classes should be placed upon the employer. In respect to attendance at technical schools for vocational instruction, it is necessary to make provision that in certain trades apprentices or youths under twenty-one years of age be allowed time off during the week to attend technical schools.

Overlapping.

Your Commission has made extensive inquiries into the matter of overlapping and duplication of school and college courses, and is of opinion that on the whole this evil is not at present greatly in evidence; it is creeping in to some extent when district high schools, technical day schools, and high schools exist in the same locality. In such cases the district high school should be closed, and the work at present undertaken therein divided between the high schools and the technical day schools. Education Boards should be granted the power of closing existing district high schools whenever the work now being carried on therein can be undertaken equally well in neighbouring educational institutions. A certain amount of overlapping exists as between art schools and technical schools, but it is difficult to see how this is to be avoided, unless all art schools receiving Government grants are placed under the control of the proposed School Boards or Education Boards.

Trend of Education.

One of the main, if not the chief, defects of the present scheme of education is its tendency to make the public examinations the objective, the result being that the ranks of clerks (in the case of men) and of typistes (in the case of young women) are

unduly extended. The growth of the cities at the expense of the rural and country districts, as disclosed by the last census, is disquieting. If the suggested modifications of the syllabus result in a bias being given to the primal industries of the Dominion—agriculture, dairying, and other important industries—and to the increased productiveness of the soil, the Commission is convinced that the material prosperity of the people of the Domioion will be greatly enhanced.

Secondary-school Endowments.

The position of endowments for secondary education is hardly as satisfactory as would seem to be necessary, if the full purpose of this means of ensuring the real intentions of the trusts in the light of modern methods is to be carried out. While it is not suggested that any attempt should be made to divert the revenue derived from the district at present benefited, considerable improvements could be effected in the administration of the funds in question. Instances of Government subsidies having been injudiciously given to secondary schools were drawn attention to with reference to Christchurch and Oamaru institutions respectively. In the one case £601 was paid to a richly endowed school for the erection of a gymnasium, and in the other the principal returned the full amount of his salary (£500 a year) to the Board of Governors and Government subsidies of £1 for £1 were paid on the salary returned.

Reduction in Expenditure.

There are not many directions in which economy can be exercised without impairing the efficiency of the education system. A saving of some £50,000 per annum might be effected by, *inter alia*, the alteration of the system of control, the demilitarization of Junior Cadets, the placing of the whole work of inspection in the hands of the Boards, the reform of free places and scholarships, the simplification of returns, the supply of all school requisites to the Boards direct from the manufacturers on the order of the Council of Education, and the abolition of postal and telegraph charges which involve considerable expense in book-keeping alone.

Demilitarization of Junior Cadets.

For the systematic carrying-out of the course of physical instruction recommended in another part of this report it is desirable, owing to the inauguration of the scheme of Dominion defence, that the Junior Cadets of the Dominion should be demilitarized. Universal recognition will be made of the good work done by the Junior Cadets in the past, of their fine *esprit de corps*, and their general amenability to discipline, while the zeal of their officers of all ranks is entitled to the highest praise. We therefore recommend that, wherever it is possible to do so, the military authorities should mark their sense of the public spirit shown at all times by the teachers who have so willingly given up their time and devoted so much personal attention to forwarding the movement by conferring on these officers commissions either in the Territorials or the Senior Cadets. We see no reason why the Junior Cadets, besides being permitted to wear a uniform dress in keeping with their altered conditions, should not continue to engage in squad and company drill and other manœuvres consistent therewith, should not still practise shooting with miniature rifles, and should not where possible adopt the best of Boy Scout methods. These methods are designed in the main to upbuild character; and whatever makes for the strengthening of the moral as well as the physical side of boy nature must ultimately produce good, honest, upright, and God-fearing citizens. Schoolboys under fourteen years of age should not be brought under the Defence system.

All communications affecting the Cadets should be made through the headmaster of the school.

Agricultural Education.

In respect to the rural course in district high schools, and to the teaching of agriculture generally, and to the great importance of agriculture to the Dominion, this subject is not receiving the attention it deserves.

To meet objections that have been urged in some quarters against the rural course, we recommend that in the Junior Civil Service and the Matriculation Examinations more marks than those at present allotted should be given to the subjects in the rural course.

Continuation classes in agriculture and dairy-work in connection with district high schools should be arranged wherever practicable, due consideration being given to the time of the year and the hours of the day when such classes can be carried on with least inconvenience to farm-work.

It is further recommended that as soon as the attendance in the secondary department of a district high school in an agricultural or pastoral district reaches an average of eighty an agricultural high school should be established on the lines of those recently set up in Victoria and New South Wales.

Two agricultural colleges should be established in the Dominion—one in the North Island and one in the South Island—at which, in conjunction with the University colleges, practical work up to the Bachelor of Agriculture and Bachelor of Veterinary Science standards might be undertaken. Shorter courses of study should be arranged in order to qualify Inspectors, teachers, and organizers in the different branches of agriculture, directors of dairy schools, &c. Lincoln College might well undertake this work for the South Island, while the college to be established under the recent Campbell bequest in the Auckland District might, with Government assistance, satisfy the needs of the North Island.

The Syllabus.

On the question of the efficiency of the present primary-school system and the syllabus generally, an immense amount of evidence, much of which is remarkably conflicting, has been taken. Some witnesses have given it as their opinion that the children leaving our primary schools to-day are not as well grounded in the essentials of a primary-school education as were the pupils of ten or fifteen years ago. On the other hand, many have asserted quite as confidently that the boys and girls of to-day are just as well grounded, and are, moreover, more resourceful and more self-reliant than were the scholars of a decade since. The weight of the recorded testimony on the whole is in support of the latter view.

Teachers and Inspectors have expressed almost unanimous approval of the aim and scope of the present syllabus, and it appears evident that any apparent weakness has been the result of misunderstanding and misinterpretation on the part of many teachers and Inspectors. While the Commission concurs in this view of the syllabus, it is strongly of opinion that the time has come when it is advisable to make alterations and modifications, in order to impress upon all concerned the paramount importance of paying the utmost attention to those essentials which, in a primary-school course should ever be the first consideration.

1. *Speech.*—In order to counteract the tendency amongst young people towards slovenliness in speech, indistinct utterance, and impurity of vowel sounds, it is recommended that throughout the whole school course daily practice be given in correct methods of breathing, and in the right use of the tongue, lips, and teeth in speaking. Exercises, graduated to suit the classes from the infant department to Standard VI, having for their object the securing of purity of vowel-sounds, should be given daily. Teachers should be instructed to pay special attention to their own speech in order that their pupils may have, as far as possible, correct models for imitation.

2. *Reading.*—In Standards I, II, III, and IV, the Miscellaneous Reader is unnecessary, and even harmful, if every extract is treated as a task. The quantity of matter is so great that the cramming of all the lists of spelling and meanings, together with the explanation necessary occupies so much time as to leave little or none for supplementary reading. The result is that, instead of our children leaving the primary school with a real love for the reading of good literature, they frequently have an utter distaste for it. Your Commission strongly recommends that in Standards I, II, III, and IV the requirements of the syllabus in reading should be met by the use of the *School Journal*, together with Supplementary Readers. In this connection there should be provided in every schoolroom a book-case containing a supply of books selected from lists prepared by the Education Board and suited to the age of pupils in the respective standard classes. Several sets of Supplementary Readers—sufficient for the whole or part of the pupils in a class—should be provided. Silent reading, correlated with oral or written composition, geography, or history, should be encouraged. Children might also keep a

list of the books they read. In Standards V and VI, instead of the Miscellaneous Reader now in use, a book on the lines of "Preparatory Reading and Composition," by Lewis Marsh, should be prescribed, when approved by the Council of Education. It might be prepared under the direction of the Council of Education and be printed by the Government. In addition to such a text-book, the *School Journal* and Supplementary Readers should be used.

3. *Spelling.*—This should remain as at present prescribed, except that words might be taken from selected lessons in the *School Journal.* This subject should be judged, not so much from special tests, as from the spelling shown in composition and other written work.

4. *Poetry.*—The *School Journal* should contain poetry suited to the requirements of the children in the several standard classes. As in the teaching of reading, special attention should be paid to the securing of clear enunciation, distinct articulation, and purity of vowel sounds.

5. *Writing.*—Neatness, simplicity, legibility, and reasonable speed should be insisted on in all written work. Formal lessons in writing should not be required in classes above Standard IV. This would enable the pupils in these classes to devote more time to other essential subjects.

6. *Composition.*—The amount of formal grammar prescribed in the present syllabus is sufficient, but the requirements for each standard class should be more definitely stated.

7. *Arithmetic.*—The work prescribed should be simplified and made more practical. Great emphasis should be laid upon the importance of oral and mental work, especially in classes below Standard IV. In all tests in these lower classes no problems should be given except such as can be worked mentally by the pupils. Rapid, neat, and accurate mechanical work should be the aim of the teacher. In the upper standard classes the answers to at least four out of any six questions set in a test should depend upon mechanical accuracy, and correctness in these answers should entitle a pupil to a pass. The syllabus in this subject requires recasting in the direction of reducing the requirements for certain classes and redistributing the work over the whole of the standards.

8. *Geography.*—The courses now prescribed should be unified and simplified, and the requirements in mathematical geography reduced in quantity and simplified in method of treatment. More attention should be paid to that branch of the subject which deals with industries and products. An oral class examination should be the only test of work covered in mathematical geography.

9. *History.*—Ample evidence has been forthcoming to show that in the past this subject has been neglected in most schools. A definite course of study in history should be set out; even for Standards I, II, and III there should be drawn up lists of stories in connection with men and women who have performed notable deeds in British and in New Zealand history. These stories should be told to or read by the children. In the three upper classes a definite three-years course in British and New Zealand history and in civics should be clearly laid down, and Inspectors instructed to see that such course is satisfactorily carried out. A text-book like that now in use in some Education districts should be prescribed. The use of the lantern in teaching history and geography should be encouraged wherever practicable.

10. *Drawing.*—The course of study should be simplified. Freehand drawings should be made almost entirely from nature or from actual objects. The requirements in geometrical drawing should be reduced, and only so much prescribed as can be applied to practical purposes.

11. *Singing.*—The quality of the instruction varies very much in different districts. Singing is so important a subject in connection with all school-work (particularly in the teaching of infants) that special attention should be paid to it in the teachers' training colleges. If the Dominion be divided into five Education Districts, each Board should appoint a travelling Instructor who would visit the schools, give model lessons, hold Saturday classes for teachers in various centres, and generally do much to raise the standard of musical taste throughout the Dominion.

12. *Physical Instruction.*—This subject should be regarded as one of the most important in the primary-school course. Very special attention should be paid to

the physical education of our boys and girls, and, as with singing, it is recommended that in each of the five education districts an expert in physical instruction be appointed whose duty it would be to superintend the carrying-out of a course of study in this subject approved by the Council of Education.

13. *Moral Instruction.*—Ample opportunties are provided in the list of subjects suggested in the syllabus under this head, and if teachers will only realize that "The purpose of education is to give to the body and the soul all the beauty and all the perfection of which they are capable," time will be found for giving earnest attention to this subject, and character-building will be regarded as the goal to which all educational effort must be directed. In order to help teachers in this part of their work, the Commission strongly recommends that the series of books, "The Children's Book of Moral Lessons," by F. J. Gould, should be placed on the shelves of every school library.

14. *Nature Study.*—During the past few years much has been done in the way of introducing this subject as an integral part of our primary-school course, but much still remains to be done. Nature study should hold an important place on the time-table of every school. From informal chats in the infant department on the animals and plants of a district, on simple natural phenomena, and the telling of nature stories, there should be developed a definite course of lessons for the standard classes, leading naturally to the study of elementary experimental science in Standards V and VI. Everything should be done to create and foster in the child a real living interest in his natural environment, and to turn his attention to the land and its products. Wherever possible, in town or country, gardens should be attached to every school. Nature knowledge acquired in the primary school should lead to the study of elementary agriculture as taught in the rural courses of the district high schools, and so on to the more advanced work of the agricultural colleges. In teachers' training colleges all students should take a course of study in nature knowledge, men taking more advanced work, while women should devote part of their time to domestic science.

15. *Handwork.*—The degree of interest taken in this subject varies very much in different districts. According to the departmental report for 1911, only 22 per cent. of the schools in the Grey District took any course in handwork, while in Southland 98 per cent. of the schools claimed capitation for the teaching of some branch of this work. In some districts it was ascertained that in order to attend cookery and woodwork centres, children and teachers were obliged to travel long distances by train or coach, and that in some cases they were away from their homes for twelve or thirteen hours in a day. Your Commissioners were impressed with the fact that while so many men and women on the staffs of our primary schools have qualified by examination as teachers of woodwork or cookery, only in rare cases have their services been utilized. Where provision is not made for the teaching of woodwork or cookery in their own school, it is recommended that children should not be required to travel distances necessitating absence from their homes for more than six hours in a day.

16. *Lessons in Health.*—The list of subjects in the present syllabus seems sufficient, but it is suggested that on every school time-table "Lessons on Health" should find a place, and that Inspectors should be directed to see that the lessons are really given, and that the children have profited by them. It is further suggested that in reference to temperance, the following subjects be added to the list: "Alcoholic beverages and their action on the body; moral evils of intemperance; what intemperance costs." Your Commissioners are pleased to know that the Government have recognized the great importance of attention to health generally by making provision for the medical inspection of school-children. It is further recommended that at each of the four training colleges arrangements be made for the giving by qualified dentists of courses of lectures on the proper care of the teeth. Record-cards of physical development should be kept in every school.

Boards of Education should be enabled to insist on medical and dental attendance where necessary; to pay for the attendance where the parents cannot do so; and to compel payment where they will not.

In recasting the syllabus it is recommended that the requirements should be set out in as simple a form as possible; that the course of study prescribed for country

schools should be less exacting than that for large schools; and that all suggestions in connection with the treatment of subjects, and all regulations dealing with the inspection and examination of schools, be printed in separate pamphlets.

The number of term examinations in primary schools should be reduced from three to two per annum.

The Kindergarten.

There is a consensus of opinion that the training afforded by the kindergarten is not only the best form of infant education, but is the basis of true technical education. Several of the witnesses who are public-school teachers have cordially indorsed the claim of the Managers of the free kindergartens in the large centres of the Dominion that the child who passes from the kindergarten into the infant classes of the State school is better prepared for the standard work than the child who has not had the advantage of preliminary kindergarten instruction. Furthermore, the boy who has gone through a proper kindergarten course is better equipped for the elementary manual training-classes of the primary school than the boy who has not attended a kindergarten, inasmuch as he possesses not only a prepared mind but prepared hands as well, and his powers of observation have been greatly quickened. The establishment of properly equipped kindergarten departments in the four training colleges and the proposal to give in these institutions portions of a systematized course of training for the students of the State-assisted free kindergartens indicate that the time is approaching when the kindergarten should constitute the initial step of the education ladder of the Dominion. Whenever Education Boards deem it advisable to establish kindergartens in connection with the primary schools in the large centres all infants should be taught therein until at least six years of age. Capitation should be paid at the same rate as to the kindergarten associations. In the meantime, the State may well continue its assistance to the several free kindergarten associations in the Dominion.

Education of Girls.

There is evidence to show that the present primary and secondary education system presses with undue severity on girls between the ages of twelve and seventeen years. It is suggested that this evil might be reduced by a judicious extension of the system of accrediting, by differentiating in the school-work required of girls and boys, by greater prominence being given to the domestic-science course, and by limiting the amount of homework set in the secondary schools.

Sex Physiology.

Evidence has been given upon the question of teaching sexual physiology to the older boys and girls in our primary and secondary schools. The general opinion appears to be that something of the kind should be undertaken, but there is much diversity of view as to when and by whom this instruction should be given.

The Commission agrees that advice should be imparted to all boys and girls at some time before they finally leave school—preferably by parents, but in view of the fact that such necessary instruction is too often neglected by parents, the Commission recommends that teachers should be enjoined to adopt a form of lecture such as has been suggested by Dr. Home (M.D., Ch.M., Edinburgh, and D.Ph., London), whose evidence appears in the Appendix to this report; but, better still, every head teacher should, where practicable, deal personally and sympathetically with each individual pupil. And we would direct special attention to the evidence on this point given by the Principal of the Girls' College at Wanganui, where Miss Cruickshank has arranged for a series of excellent lecturettes by a medical lady of experience and sound judgment.

Scholarships and Free Places.

The present system of awarding Junior National Scholarships and Education Board Scholarships, and the present Certificates of Proficiency and Certificates of Competency examinations should be abolished. One examination at least equal to the present Free Place examination should be held in December in each year; free places to high schools, to technical day schools, or to district high schools should be

awarded to those candidates who gain not fewer than 50 per cent. of the marks obtainable in that examination, and all pupils who do not so qualify, or who do not elect to take advantage of such free place should be required to attend at a continuation or technical or agricultural school, provided that attendance shall not be compulsory unless such school is within a radius of four miles for day and three miles for evening classes. In the case of schools approved by the Inspectoral Board of the education district, the head teacher should be allowed to "accredit" his pupils for free places at a high school, provided that this right may be withdrawn in the event of it being shown that the power of "accrediting" has been exercised injudiciously. The money saved by the abolition of scholarships should be expended in the direction of providing a further number of boarding-allowances for holders of free places residing in the country and compelled to live away from home in order to take advantage of their free places. It is further recommended that the parents of children entering upon a secondary-school course should be required to undertake that such children will attend regularly at the secondary school for a period of at least two years.

School Buildings and Playgrounds.

Your Commission at each of the centres visited inspected as many schools as possible in order to note by personal observation the style of building, the method of lighting, ventilation, heating, sanitation, &c. In several districts, notably Auckland, Wanganui, and North Canterbury, the latest primary-school buildings are excellent in design, lighting, and ventilation, but a number of the schools were by no means up to the standard to be desired, especially when it is remembered that they were all large schools. To ensure improvement in this respect, your Commission suggests that the architects to the proposed five Education Boards should confer at regular intervals in order to consider and discuss matters relating to the design of school buildings. It is further suggested that all plans for proposed new buildings should be approved by the Health Department in regard to lighting, ventilation, &c.

In large schools, particularly in the southern districts where the climate is rigorous, it would be in the interest of economy to instal a central heating-system in place of the expensive and wasteful method of open fires.

In regard to school furniture, it was a matter of surprise to find that in some districts the old-fashioned long desks, together with forms without backs, accommodating as many as ten pupils, are still in common use. These should be replaced as soon as possible by dual or single desks.

Schools should not be used for such purposes as socials, dances, polling-booths, &c., where other suitable buildings are available.

The cost of installing sewerage at schools should be made a charge upon the New Buildings Account.

The neglect of the provision of playground accommodation at many of the city schools was forcibly impressed upon the Commission at all the large centres visited, and, as the health of the children should be the concern of the local authorities, it would be a wise thing to provide for assistance from them towards this object. In future, no grant should be given for the erection of a school unless at least four acres of land are available for the site.

Consolidation of Schools.

Much evidence was received in favour of what is known as the "consolidated school," the name by whch the unit resulting from the union of two or more country schools is known. Consolidated schools have been established during recent years in many of the States of America and, coming nearer home, in New South Wales, in almost every case with the best possible results. From the report submitted by an Education Commission recently set up by the Legislature of Wisconsin, the following remarks on this subject are quoted,—

> "The larger country school represents the chief need for the reform of rural education. The isolated, one-room country school is bound under the necessities of modern life to pass away. . . . The advantages of a consolidated school have been demonstrated in too many States

and under too many conditions to be open to debate. From the standpoint of administration, finance, general education, and agricultural training, the enlarged school shows the way out of many of the present difficulties. It makes possible the construction of artistic modern buildings, properly heated, ventilated, lighted, equipped, adequately provided with sanitary arrangements, pure drinking water, &c.; in fact, just the necessities of the modern school which the one-room district school does not have, and never has had. More important than these obvious advantages, the consolidated school provides for overcoming the inherent difficulty of the rural school, namely, the attempt to instruct by one teacher six- to sixteen-year-old pupils."

Additional advantages to be looked for from the consolidation of schools are,—

(*a.*) The *per capita* cost is lessened;
(*b.*) The average daily attendance is increased;
(*c.*) The pupils remain at school for a much longer time;
(*d.*) The teaching-time is increased and the time devoted to home-work is diminished;
(*e.*) Better salaries are paid and hence more highly qualified teachers are employed;
(*f.*) The schools are better supervised; and
(*g.*) Better material equipment is provided as regards buildings, libraries, heating, and sanitation.

Many of the Education Boards have supplied the Commission with maps of their districts and names of the country schools which in their opinion might be consolidated. It is evident that the experiment might be tried with every prospect of success in a considerable number of cases throughout the Dominion, and it is strongly recommended that an attempt at consolidation should be made forthwith.

In addition to the consolidation of primary schools in country districts, it is further recommended that district high schools be combined wherever possible. With reasonable co-operation on the part of the railway authorities something might be done in this direction.

Facilities for Attending Schools.

The Commission regrets that there appears to be little tendency on the part of the Railway Department to provide special facilities for the conveyance of pupils to primary, secondary, and technical schools. Considering the importance of education to the community this attitude is, to say the least, somewhat strange. In many cases a slight rearrangement of the time-table or the addition of a carriage to a goods-train would result in great benefit to those pupils who cannot get the required instruction in the locality in which they live. Cases could be mentioned where there would be no extra cost to the Railway Department or inconvenience to the travelling public by adopting such a course, but existing departmental systems would appear to be a serious obstacle to a good understanding on these points.

Free School-books.

Witnesses were unanimous in their disapproval of the system of supplying free school-books. It was stated that in some cases between eighty and ninety per cent. of the pupils purchased their own book, and that teachers found difficulty in providing storage space for the books provided by the State but unused by the children. It is recommended that the grant under this head be discontinued, and that a portion of the money be spent on supplementary readers and books for school libraries. The amount spent by the Department last year was about £10,000.

Rewards for Zeal.

The Boards of Education should be encouraged to nominate periodically one Inspector, or one primary-school teacher, or one secondary-school teacher, or one technical-school teacher, who, in recognition of zeal shown in his or her work, shall, if the Council see fit, be given one year's leave on full pay, for the purpose of studying the schemes of national education in force in other parts of the world.

Private Schools.

In regard to private schools, it is recommended that section 151 of the Act be amended so that the clause beginning "The head teacher of such school may apply for" shall read "The head teacher of such school shall apply for." It should also be a condition precedent to the exemption of these schools that the equipment, buildings, playgrounds, sanitation, &c., are at least equal to those obtaining at the State schools in the locality.

It is recommended that no State aid be granted to any secondary school that is not under the control of an Education Board.

Correspondence Schools.

In the opinion of the Commission legislation should be introduced for the registration of all schools of correspondence, whether local or foreign, within the Dominion.

Superannuation.

The matter of increasing the allowance payable under the Superannuation Act to widows has been brought under the notice of the Commission; but it is thought to be a question for the Actuary and the contributors. It is recommended that the Actuary be asked to ascertain the amount of increased contribution required from men in order to secure for widows an allowance of £26 per year, instead of £18 as at present; and that when this is obtained a referendum of male contributors to the fund be taken as to their willingness to contribute the additional amount required.

Members of the Education service who did not elect to become contributors to the Superannuation Fund before the coming into operation of the amending Act of 1908 were permanently shut out from the benefits of the fund. Under the original Act they had the right to become contributors without loss of back service, whenever they found themselves financially able to comply with the conditions imposed by the Superannuation Board. This right was withdrawn, without notice, and much hardship has therefore been inflicted on many old and faithful servants of the State. The Education Committee of the House has twice recommended that a further opportunity should be given for teachers and others permanently employed on the 1st January, 1906, to become original members of the fund. Your Commission indorses this recommendation, and suggests that legislation be enacted giving the persons referred to above the right to become original members of the fund on payment of back contributions, together with interest on such contributions calculated at the rate of 5 per cent. per annum. This privilege should be available for a limited period only—say, one year.

It is also recommended that retiring-allowances be paid on the three best years of salary, or on the last three years, at the option of the contributors.

Compulsory Attendance.

It was pointed out in evidence that there were a number of defects in the compulsory sections of the Education Act, including the provision in section 152, which allows seven days to elapse before a parent who fails to send his child to school is liable to a fine, the conflict between the minimum age of employees under the Factories Act and the maximum compulsory age for school-attendance, the prevalence of the employment of children of school-age during school-hours, and the want of power to commit habitual truants to an industrial school at an earlier age than that prescribed.

Children and Street Trading.

Evidence was given at Dunedin showing that there is a tendency to employ lads at times and occupations that interfere with their proper instruction at school, and the attention of the Commission was drawn to the steps taken by the London County Council to prevent children of educable age being withdrawn from school during schooltime, or employed in duties that do not allow them to receive the full benefit of the primary course. A similar state of things has been revealed in other parts of the Dominion.

It is recommended that section 153 of the Education Act be amended in the direction of making employers equally liable with parents in such cases.

The Commission would also direct attention to the bad habits engendered by young children of both sexes being allowed to loiter about the streets at night or gather in the neighbourhood of theatres, picture-shows, &c., at hours when they should be in their homes or in their beds. This is an evil of such magnitude that if it is not coped with and minimized, the results must be disastrous to the morality of the community.

The Commissioners wish to acknowledge the courtesy of the Education Boards in providing accommodation for the sittings of the Commission, and the trouble taken by their officers to facilitate the inquiries necessary to the due carrying-out of the investigation enjoined by the order of reference.

The Inspector-General of Schools (Mr. G. Hogben, M.A.) rendered the Commission valuable service.

The Secretary to the Commission (Mr. F. K. de Castro) proved especially valuable and efficient in performing his exacting secretarial duties, and well earned the gratitude of the individual members of the Commission.

In witness whereof we have hereunto set our hands and seals this thirty-first day of July, in the year one thousand nine hundred and twelve.

MARK COHEN, Chairman.
WILLIAM DAVIDSON.
JAMES ROBERT KIRK.
FRED. PIRANI.
HUGH POLAND.
JOHN CHARLES THOMSON.
THOMAS UMFREY WELLS.

MINORITY REPORT.

It is with extreme regret that I find it necessary to differ so much from my colleagues on the Commission as to find it necessary to add a Minority Report to the very comprehensive statement of the faults and requirements of the education system. The main points in which I differ from the conclusions of a bare majority of my colleagues are two—namely, the setting-up of an Advisory Council of Education, and the absence of a recommendation for the election of Education Boards and School Boards under the system of proportional representation.

Apart from the unweildy proportions of a Council of Education, it is my opinion that no genuine reform is possible in the administration of education unless there is real control by the people from the official head of the Department down to the School Committees. My proposal was for a Council, consisting of the Minister and seven members, the latter to hold office for five years and to give their services entirely to the work of the Council. The seven members to be appointed or elected as follows:—

Two (one of whom should be the Director of Education) to be appointed by the Minister;
Two to be elected by the members of the five Education Boards;
Two to be elected by the certificated teachers (one from the North Island and one from the South Island); and
One to be elected by the School Inspectors.

The duties of the Council to include the control of the whole system of primary, secondary, and technical education, and to meet at least once every two months. In the event of any one actively employed in educational work being appointed to the Council, his or her salary, rights, and privileges to be conserved. Such salaries to be paid to the members of the Council as Parliament may decide. Members of the Council could specialize in different branches of education, and their united conferences should make for considerable benefit to the administration of our education system. The Council should be intrusted with the control of the funds voted by Parliament for education, subject only to the veto of the Minister of Education. The Inspectorate and grading of teachers for Dominion promotion should be under the control of the Council. One Chief Inspector should be attached to the staff of each Education Board as a Superintendent of Education in the respective education districts.

(Sgd.) FRED. PIRANI.

Wellington, 31st July, 1912.

MINUTES OF PROCEEDINGS.

WELLINGTON.

FRIDAY, 31ST MAY, 1912.

The Commission met at 11 a.m. in the Parliamentary Library Building.

Present: Mr. M. Cohen (in the chair), Messrs. W. Davidson, J. R. Kirk, F. Pirani, J. C. Thomson, and T. U. Wells. Mr. H. Poland was unavoidably absent.

The Honourable the Minister of Education extended a welcome to the Commissioners. The Chairman thanked the Minister for his welcome, and stated that probably an extension of time in which to report would be asked for.

The Inspector-General of Schools (Mr. G. Hogben) was present as representative of the Education Department.

The Commission was read by the Secretary.

Resolved: (*a*) That the proceedings of the Commission be open to the Press and public; (*b*) that a sub-committee be set up to report as to the witnesses who should be asked to attend to give evidence; (*c*) that the evidence of witnesses be taken on oath or by affirmation.

The Inspector-General of Schools gave evidence.

The Commission rose at 5.15 p.m.

SATURDAY, 1ST JUNE, 1912.

The Commission resumed at 10 a.m., there being present Messrs. Cohen (Chairman), Davidson Kirk, Thomson, and Wells. Messrs. Pirani and Poland were absent on leave.

It was decided to make representations to the Hon. the Minister of Education for leave to visit the following towns, in addition to those named in the order of reference—viz., New Plymouth, Wanganui, Napier, Blenheim, Nelson, Greymouth, Hokitika, Timaru, and Invercargill.

The Inspector-General of Schools continued his evidence.

The Commission rose at 11.20 a.m.

AUCKLAND.

TUESDAY, 4TH JUNE, 1912.

The Commission met at the offices of the Auckland Education Board at 10.45 a.m., all the Commissioners being present.

The Secretary of the Board, in the absence of the Chairman, who was engaged elsewhere, welcomed the Commission to Auckland, and placed the Board-room and offices at the disposal of the Commission.

The Inspector-General continued his evidence, and Mr. E. C. Mulgan, Chief Inspector of Schools in the Auckland District, was examined at length, the Commission adjourning at 5.25 p.m.

WEDNESDAY, 5TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

Mr. Mulgan continued his evidence, and the following witnesses were examined: Messrs. R. Campbell and N. R. McKenzie, together with Misses E. Simpson and M. S. Newman, on behalf of the Auckland District Educational Institute; Mr. F. H. Brown (president of the Auckland Assistant Masters' Association).

The Commission rose at 6 p.m.

THURSDAY, 6th JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

Evidence was given by Mr. H. D. J. Mahon, on behalf of the assistant masters of the Auckland Grammar School; by Bishop Cleary, on behalf of the Roman Catholic diocese of Auckland; by Mr. H. A. E. Milnes, Principal of the Auckland Training College; by Mr. W. O. Lamb president of the Auckland Country Teachers' Association; by Mr. P. G. Andrew, secretary of the Poverty Bay School Committees' Association; and by Mr. R. E. Rudman, Principal of the Thames High School.

Written statements were received from Messrs. C. C. Howard, T. Vivian, and A. H. Vile, and jointly from representatives of various School Committees in the Thames district.

The Commission rose at 6 p.m.

FRIDAY, 7TH JUNE, 1912.

The whole of the morning was devoted to visiting schools in and around Auckland, and at the Town Hall the Commissioners were tendered an official reception by His Worship the Mayor (Mr. G. J. Parr).

In the afternoon (all the Commissioners being present) the following witnesses were examined: Messrs E. C. Purdie and H. G. Cousins, and Mrs. S. A. Moore-Jones.

Written statements were received from Mr. C. H. Mellsop, the Rev. W. E. Lush, and the hon. secretary of the Secondary Schools Association.

The Commission rose at 6 p.m.

SATURDAY, 8TH JUNE, 1912.

The Commission resumed at 10 a.m., all the Commissioners being present.

Miss Butler and Mr. J. W. Tibbs were examined.

Written statements were received from Messrs. R. A. Armstrong and H. J. Prior.

The Commission rose at noon.

MONDAY, 10TH JUNE, 1912.

The Commission resumed at 9·30 a.m., all the members being present.

The following witnesses gave evidence—viz., Messrs. R. Crowe, T. W. Leys, F. E. N. Gaudin, E. W. Payton, George George, and G. J. Garland (Chairman of the Education Board).

Communications were received from Mr. G. A. Rawson and the Auckland Educational Institute, while the Minister of Education forwarded copies of resolutions from the Taranaki and Grey District Educational Institutes urging that the Commission should visit New Plymouth and Greymouth respectively.

The Commission adjourned at 6.30 p.m.

TUESDAY, 11TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners attending save Mr. Poland, to whom leave had been given.

Evidence was tendered by Messrs. S. Lamb, H. Wallace, G. L. Peacocke, F. Heaton, E. C. Banks, C. J. Parr, and J. Farrell, also by Mrs. M. W. Myers.

Votes of thanks were passed to the Auckland Education Board, to the Auckland Educational Institute, and to the reporters of the local Press.

The Commission rose at 4 p.m.

DUNEDIN.

FRIDAY, 14TH JUNE, 1912.

The Commission resumed at the office of the Otago Education Board in Dunedin, assembling at 9.30 a.m. All the Commissioners were present.

It was resolved to make application to the Minister for an extension of time for one month in which to report.

The following witnesses were examined: Professor D. R. White, Messrs. P. Goyen, A. Marshall, and G. W. Macdonald.

Written statements were received from Messrs. G. Wilson, T. Isemonger, and J. W. Tibbs.

The Commission rose at 5.45 p.m.

SATURDAY, 15TH JUNE, 1912.

The Commission met at 9.30 a.m., all the Commissioners being present.

The Secretary notified the receipt of a supplementary Commission empowering the Commissioners to visit two places in addition to those named in the original Commission, but they must be agricultural districts.

Evidence was given by Miss F. M'L. Allan, and by Messrs. E. Pinder, W. M'Elrea, W. S. Fitzgerald, and Thomas Scott.

The Commission rose at 12.45 p.m.

MONDAY, 17TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses gave evidence: Messrs. F. Milner, W. J. Morrell, S. M. Park, C. R. Richardson, R. Ferguson, and J. H. Wilkinson (the two last mentioned representing the Dunedin and Suburban Schools Committees' Association).

A written statement was furnished by Mr. O. D. Flamank.

The Commission adjourned at 5.15 p.m.

TUESDAY, 18TH JUNE, 1912.

The Commission resumed at 10 a.m., all the Commissioners being present.

The following witnesses gave evidence: Mrs. R. S. Reynolds (in committee), Miss F. J. Ross, Messrs. P. G. Pryde, J. B. Waters, T. J. Walker (in committee), J. E. Ryan (also in committee), C. R. Bossence, G. C. Israel.

Mr. A. Marshall was re-examined.

Written statements were received from Messrs. W. S. Fitzgerald, D. S. B. Squire, T. A. Wallace, and the secretary of the Waitaki High Schools Board.

The Commission rose at 5.45 p.m.

WEDNESDAY, 19TH JUNE, 1912.

The Commission resumed at 9.30 a.m., and all the Commissioners were present.

The following witnesses gave evidence: Miss L. Kelsey, Messrs. A. M. Barnett and James Mitchell.

A written statement was received from Mrs. R. S. Reynolds.

The Commissioners visited a number of the City and suburban schools, and, before separating, passed votes of thanks to the Otago Education Board and the Press.

The Commission rose at noon.

INVERCARGILL.

THURSDAY, 20TH JUNE, 1912.

The Commission met at 9.30 a.m. in the offices of the Southland Education Board, all the Commissioners being present.

The following witnesses gave evidence: Miss H. Birss, Messrs. J. C. Smith, A. McNeil, D. McNeil, J. Hendry, J. Hunter, A. Inglis, and J. Hain.

A written statement was received from Dr. R. Church, of Dunedin.

The Commission rose at 6 p.m.

FRIDAY, 21ST JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses were examined: Misses N. Jobson, E. Howes, and M. D. Steel (the last-named in committee), Messrs. T. D. Pearce, W. Macallister, J. Neill, J. Moody, O. Duff, and W. A. McCaw, also Dr. D. E. Hansen.

Written statements were received from Messrs. E. Marryatt and A. W. Tyndall, and jointly from three women assistants of the Southland Girls' High School.

During the afternoon the Commission paid a visit of inspection to some of the city and suburban schools, and also visited the Technical College.

The Commission rose at 9.30 p.m.

SATURDAY, 22ND JUNE, 1912.

Some of the Commission visited the Riverton district.

Votes of thanks were accorded to the Southland Education Board and to the representatives of the local Press.

DUNEDIN.

MONDAY, 24TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present, except Mr. J. C. Thomson, M.P., who was absent on leave.

The evidence was taken of His Lordship the Primate of New Zealand and of the Dean of Dunedin the Commission rising at 10 a.m.

CHRISTCHURCH.

TUESDAY, 25TH JUNE, 1912.

The Commission met at 9.30 a.m. at the office of the North Canterbury Education Board, all the Commissioners (except Mr. Thomson, M.P., on leave) being present.

The Secretary notified the receipt of a supplementary Commission extending the time for reporting till 25th July, 1912.

The following witnesses gave evidence: Messrs. M. Dalziel (Chairman of the North Canterbury Education Board), T. W. Adams, T. S. Forster, H. Bignell (Chairman of the Grey Education Board), T. G. Malcolm, W. Brock, and C. D. Hardie.

Written statements were received from Mr. L. B. Wood, the president of the Women's Christian Temperance Union at Stratford, the Westland Education Board, and the Gisborne branch of the Hawke's Bay District Educational Institute.

The Commission rose at 6 p.m.

WEDNESDAY, 26TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses were examined: Miss E. Chaplin, Messrs. L. F. de Berry, T. R. Cresswell J. W. McGregor, E. U. Just, F. Evans, F. Alley, and J. Caughley.

A written statement was received from Mr. W. Aiken.

The Commission rose at 5.35 p.m.

THURSDAY, 27TH JUNE, 1912.

In the forenoon the Commission visited a number of schools in and around Christchurch, and resumed sitting in the afternoon, when all the Commissioners were present.

The following witnesses were examined: Mrs. Langford and Messrs. J. McCullough, J. Weir, E. H. Andrews, H. C. Lane, and J. H. Howell.

The Commission rose at 6.10 p.m.

FRIDAY, 28TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present except Messrs. Poland and Thomson who had to leave for Wellington to attend their parliamentary duties.

The following witnesses gave evidence: Misses M. V. Gibson and M. Shirtcliffe, the Rev. E. J. Bernstein, and Messrs. C. T. Aschman, G. Scott, R. Herdman-Smith, A. Haslett, A. Bell, G. Penlington, G. T. Booth, J. A. Blank, C. E. Bevan-Brown, and D. Lumsden. Mr. J. H. Howell was further examined.

The Commission rose at 6 p.m.

SATURDAY, 29TH JUNE, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present except Messrs. Poland and Thomson, who were engaged on parliamentary duties.

The following witnesses gave evidence: Miss M. F. L. Olliver, and Messrs. G. Dalglish, J. A. Valentine, M. McLeod, and J. C. Adams (Chairman, Board of Governors of Canterbury College). Mr. H. C. Lane was further examined.

Votes of thanks were accorded to the North Canterbury Education Board and to the representatives of the local Press.

The Commission rose at 1.30 p.m.

WANGANUI.

TUESDAY, 2ND JULY, 1912.

The Commission met at 9.30 a.m. at the Technical College, all the Commissioners being present except Messrs. Poland and Thomson.

The following witnesses gave evidence: Messrs. W. A. Armour, E. Crow, C. T. Cox, E. H. Clark, D. McFarlane (chairman, Chamber of Commerce), D. Seaward, L. J. Watkin, J. Aitken, and J. K. Law.

Written statements were received from: Messrs. C. H. Gilby, H. G. Wake, J. T. Stewart, and L. Watson, Rev. O'Bryan Hoare, Canterbury Centre of Royal Life-saving Society, Canterbury and West Coast Centre St. John's Ambulance Association, Grey District Educational Institute, Ashburton Technical Classes Association, and the Eltham District High School Committee.

The Commission rose at 5.40 p.m.

WEDNESDAY, 3RD JULY, 1912.

The Commission resumed at 9.30 a.m., when all the Commissioners were present except Mr. Thomson.

The following witnesses gave evidence: Mrs. M. Woolf, Rev. J. D. McKenzie, Messrs. W. M. Luxford, L. Cohen, J. Grant, R. A. S. Browne, O. A. Banner, F. A. Bates, D. W. Low, F. A. Tyrer, T. H. Battle, J. E. Vernon, and W. Martin.

Written statements were received from Mr. F. C. Bellringer and the New Plymouth High School Board.

The Commission rose at 6.30 p.m.

THURSDAY, 4TH JULY, 1912.

In the forenoon the Commission visited a number of schools in and around Wanganui. On resuming all the Commissioners were present except Messrs. Poland and Thomson.

The following witnesses gave evidence: Miss C. M. Cruickshank, Messrs. Trimble (representative of Taranaki Education Board), G. D. Braik (Chief Inspector of Schools, Wanganui), and W. Bruce (representative of Wanganui Schools Committee Association, and Brother Basil (of Marist Brothers School).

The Commission rose at 6.30 p.m.

FRIDAY, 5TH JULY, 1912.

In the forenoon the Commission visited a number of other schools in and around Wanganui. On resuming all the Commissioners were present except Messrs. Poland and Thomson.

The following witnesses gave evidence: Messrs. A. Varney, W. H. Swanger, W. Andrews, and W. Lee-Martin. Mr. G. D. Braik was further examined. Written statements were received from Dr. G. Home and Mr. G. T. Palmer.

Votes of thanks were accorded to the Education Board and to the representatives of the local Press.

WELLINGTON.

Monday, 8th July, 1912.

The Commission met in the Education Board's office at 9.30 a.m., all the Commissioners being present.

The following witnesses gave evidence: Messrs. A. S. Aldrich, R. Lee (Chairman of the Wellington Education Board), T. R. Fleming (Chief Inspector of Schools), F. H. Bakewell, J. S. Tennant, W. S. La Trobe, W. Forster, G. MacMorran, and J. C. Webb.

Written statements were received from Miss V. M. Greig (principal of the Girls' High School at Napier); Messrs. F. Bowler, S. H. Macky, and J. H. Turner: also from the Canterbury Women's Institute.

The Commission rose at 6.10 p.m.

Tuesday, 9th July, 1912.

The Commission resumed at 9.30 a.m., all the members being present.

The following witnesses gave evidence: Mrs. T. H. Gill, Misses E. Helyer, D. Fitch, N. E. Coad, C. Freeman, and J. A. Finlayson; also by Messrs. A. A. Hintz, J. H. Warboys, C. Watson, and S. Duncan, and the Hons. J. Anstey and J. Barr.

The Commission rose at 5.10 p.m.

Wednesday, 10th July, 1912.

The Commission met at 9.30 a.m., all the Commissioners attending.

The following witnesses gave evidence: Messrs. H. A. Parkinson, E. S. Hylton, J. Haughey, and D. A. Strauchon; also Professors Hunter and Laby and Dr. Frengley.

Written statements were received from Messrs. A. S. M. Polson, F. C. J. Cockburn, and C. A. Eves, Dr. Innes, the Grey District Educational Institute, the Marlborough School Committees Association, the Napier branch of the Hawke's Bay Educational Institute, as well as from the Principal of the Wanganui Collegiate School (the Rev. Mr. Dove).

The Commission rose at 6 p.m.

Thursday, 11th July, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses gave evidence: Miss M. McLean (Principal of the Girls' High School at Wellington); Rev. Dr. Kennedy (Rector of St. Patrick's College); Brother Justin (of the Marist Brothers); Messrs. H. Baillie, F. G. Gibbs, A. Heine (Acting Principal of the Boys' College), A. de Bathe Brandon (Chairman of the Board of Governors, Wellington College); the Chief Justice (Sir Robert Stout), and the Secretary for Education (Sir E. O. Gibbes).

Written statements were received from Miss E. Chaplin, Messrs. R. Thomas, W. Kerr, and J. A. Duffy, as well as from the Rev. J. H. Mackenzie (Nelson).

The Commission rose at 6 p.m.

Friday, 12th July, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses gave evidence: Miss M. Lorimer (Principal of the Girls' College at Nelson), Messrs. George Crawshaw (Secretary of the Hawke's Bay Education Board), H. L. Fowler (Principal of the Boys' College at Nelson), Dr. H. J. McLean (representative of the Wellington division of the New Zealand Medical Association), the Rev. W. J. Comrie, and Mr. W. T. Mills (U.S.A.).

Dr. Truby King gave evidence, which was taken *in camera*.

Written statements were received from the Chairman of the Taranaki Education Board Mrs. J. H. Probyn, and Messrs. M. C. Mackay and A. G. Thompson.

The Commission rose at 5.45 p.m.

Saturday, 13th July, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners attending.

Written statements were received from the North Canterbury Headmasters' Association, from Professors H. McKenzie and J. M. E. Garrow; Mr. K. J. McLennan, and Messrs. M. Barnett and L. F. Watkins (jointly on behalf of the Wellington Society of Professional Musicians); also from Mr. C. J. Cooke.

The Commission adjourned (by arrangement) to the concert-room at the Town Hall, where Dr. Truby King resumed his evidence and explained by diagrams what beneficial effects on the human frame would result from a proper study of the laws relating to health.

The Commission rose at 12.30 p.m.

MONDAY, 15TH JULY, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present except Mr. Poland, to whom leave had been given.

The following witnesses were examined: Misses E. M. Rowley and L. Roberts; Messrs. G. L. Stewart, A. C. Gifford and R. Darroch; also Major-General Godley and Colonel Heard. Messrs. W. T. Mills, W. S. La Trobe, and A. Heine were recalled and further examined.

The Commission rose at 5.10 p.m.

TUESDAY, 16TH JULY, 1912.

The Commission resumed at 9 a.m., all the Commissioners being present, except Mr. Poland (on leave).

Correspondence was received from the Auckland District Educational Institute per the Auckland Education Board, the Women's Christian Temperance Union at Christchurch, the Moral and Physical Health Society of Wellington, and Mr. S. Botting.

The Commission visited a number of schools in Wellington City and suburbs.

The Commission rose at 5.30 p.m.

WEDNESDAY, 17TH JULY, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

Statements were received from Messrs. J. Fuller, jun., H. R. Fisher, G. M. Henderson, and J. W. M. Harrison.

The following witnesses gave evidence: The Rev. J. Dawson and Dr. R. O. Whyte (representing the New Zealand Alliance), also Professor T. H. Easterfield.

The Inspector-General of Schools resumed his evidence.

The Commission rose at 5 p.m.

THURSDAY, 18TH JULY, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

The following witnesses gave evidence: Dr. Pickerill and Messrs. J. N. Rishworth and W. R. Hursthouse (representing the New Zealand Dental Association), and Captain A. C. C. Stevens.

The Commission rose at 5 p.m.

FRIDAY, 19TH JULY, 1912.

The Commission resumed at 9.30 a.m., all the Commissioners being present.

Written statements were received from Messrs. G. Sims and R. H. Dodd, the secretary of the National Peace Society at Christchurch, and from the secretary of the Wellington Branch of the Navy League.

The Inspector-General of Schools continued and concluded his evidence.

It was resolved to apply to the Minister for an extension of time (till the 31st instant) in which to prepare the Commission's report.

The Commission rose at 5.30 p.m.

SATURDAY, 20TH JULY, 1912.

The Commission resumed at 10 a.m., all the Commissioners being present.

Written statements were received from Messrs. J. S. Small (Auckland) and G. H. Maunder.

Votes of thanks were passed to the Wellington Education Board and to the representatives of the local Press.

The Commission adjourned at 12.15 p.m.

MONDAY, 22ND JULY, 1912.

The Commission met at 9.30 a.m. at the Parliamentary Buildings, all the Commissioners being present.

Correspondence was received from the Southland District Educational Institute, Mr. W. A. Harding, and from Mr. G. W. Forbes, M.P., covering a communication from Mr. J. R. Wilkinson.

The Commission went into committee, resumed, and adjourned at 5.10 p.m.

From Tuesday, 23rd July, to Tuesday, 30th July, the Commission was engaged in Committee considering its report.

Communications were received from the Minister, extending the time till 31st July and forwarding a letter from Major Robb, of Onehunga.

A letter was received from Mr. G. S. Hill (on behalf of the Life-saving Society, Wellington), and another from Mr. E. Macdonald.

WEDNESDAY, 31ST JULY, 1912.

The Commission met at 9.30 a.m., all the Commissioners, except Mr. Pirani (to whom leave had been given), being present.

The report was finally adopted, and it was resolved to present it to the Minister at 5.30 p.m., which was accordingly done, and His Excellency's commissions returned.

MINUTES OF EVIDENCE.

WELLINGTON, FRIDAY, 31ST MAY, 1912.

GEORGE HOGBEN examined on oath. (No. 1.)

1. *The Chairman.*] What is your official position?—I am Master of Arts, University of Cambridge, and a Fellow of the Geological Society. I am Inspector-General of Schools, and head of the Education Department of New Zealand. I have the order of reference of the Commission, and it seems to me I may spend a good deal of the time of the Commission unnecessarily by going through all these headings. I have looked through them, and in regard to some of them it would perhaps save the time of the Commission if, instead of giving in full any views of my own or even the facts in regard to them, I submitted myself to examination by the Commission. As to the first heading—"The cost of State education in respect to primary, manual, technical, and secondary; and its relation to efficiency." First, as regards cost. This is set out so fully in the tables that are given in E.–1 in the hands of every member of the Commission that I shall only indicate briefly where to find them. In E.–1, on page 59 and the succeeding pages, there are certain tables. Three of these tables are given in graphic form. The two summaries to which I should call special attention are in the table called N1. That gives the expenditure on education in New Zealand for the year 1910–11—that is, the absolute expenditure on education under public control. It is divided under the heads, "Maintenance" (which includes maintenance of buildings—all maintenance) and "New Buildings and Additions." These give the total cost out of public funds, and the public funds out of which it comes are the Consolidated Fund and the Public Works Fund. Then, out of income from reserves, in the 4th column, the amounts allotted to the several departments of education are shown. The income from reserves includes the school reserves that were under the School Commissioners until April of last year, and are now under the Land Boards. These school reserves are primary and secondary. In the case of primary, they are divided among the several Boards in proportion to the population of each education district—that is, according to the Education Amendment Act, 1910, section 2, subsection (6), paragraph (*a*). In the case of secondary reserves, they are divided under paragraph (*b*) of the same section and subsection among the secondary schools in proportion to the number of pupils in average attendance at the several secondary schools. The primary and secondary schools, therefore, are the only schools that get any benefit from these education reserves.

2. Are the receipts from these reserves lumped together?—No, they are separate reserves for each district—that is, practically, each land district. The land districts are, roughly, coterminous with the provincial districts as they were reconstituted. The other reserves are the national endowments, which produce about £46,000 a year. Under the present law the revenue is to be used in reduction of the charges on the consolidated revenue. The only effect, therefore, is to reduce those charges from the point of view of national book-keeping. That is the effect of the primary reserves also, because the revenue from the primary reserves is handed over to the Education Boards, and the same amount is deducted from the statutory grants. There is not the same effect in the case of the secondary reserves, which I will mention presently. The revenue from the national endowments is allotted according to a scheme that has been approved by Cabinet among the several votes taken for education under the consolidated estimates only. Then there are the reserves that have been allocated at various times to secondary schools. They are shown under secondary schools in the column headed "Reserves"; the total amount given there is £40,000, which includes an amount out of the national enodwment. If the Commission desires it, I can show how the national endowment is allotted. Besides this, to make up the £40,000 to secondary schools, there is the revenue from the secondary-school reserves, divided in the manner described above, and the income derived by the several secondary schools from their own special endowments. That applies to all the older secondary schools—to all but one of those established by special Act. Of the secondary schools established by special Act, Marlborough is the only one having no separate endowment. (Some of the others have endowments that are very small indeed.) Marlborough has instead thereof a statutory grant of £400 a year. The new schools established under section 94 of the Education Act, 1908, have no endowment allotted to them, though they are entitled to receive a share of the provincial education reserves revenue allotted to secondary schools. There is a fair number of these now. The last one established is Hamilton; Palmerston North is another; Gore is another; Dannevirke is another. The district high schools do not receive any portion under the Act of the revenue from secondary reserves. In the continuation and technical branches there are one or two small endowments, but they are so small that they may be neglected. £6,000 practically represents their share of the national endowment. As to the University and University Colleges (there are four affiliated Colleges and one affiliated institution), each one of these last five institutions has endowments. The four Colleges, of course, are Auckland University College, Victoria College, Canterbury College, and Otago University; the fifth institution is Lincoln Agricultural College. The endowments for Auckland University College and Victoria College are very small. That of Victoria College is merely nominal. Of the total revenue of £26,000, the sum of £25,000 represents the revenue of Canterbury College, Lincoln Agricultural College, and Otago University. Auckland University College has a revenue of about £900, and

Victoria College of about £74. The sum of £1,000 put down for industrial schools and £1,000 put down for special schools out of national endowment relieve the consolidated revenue. The last column gives the total cost from all public sources. That includes income from both public funds and income from reserves—£1,232,000. That includes industrial schools and special schools which are outside this order of reference, and includes superannuation, which is also outside the order of reference. These other matters are dealt with by separate departments in a good many countries—in Victoria, for instance. Then, on the next page, the basis of comparison given is the basis that has been adopted in the United States and on the Continent of Europe. It gives the amount of expenditure per head of population. If I explain one item I think it will be enough. As to primary education, I should like to explain how the expenditure is arrived at. The remark will apply also to the first line of N1: In the case of primary education there is included in all these tables the cost of manual instruction in primary schools, which in the estimates is put down under the heading "Manual and Technical Instruction." The capitation paid from all sources on manual work generally in primary schools, and the grants for equipment given to these schools, are included under this head, except where the equipment is permanent equipment, and then it comes under the head "New Buildings and Additions," in the same line. ("Permanent equipment" is that which has not to be renewed annually, only from time to time, at long intervals.) The total cost per head, therefore, on primary education, without including new buildings—and I rather want to draw that distinction—is 16s. 5d.—namely, 15s. out of public funds and 1s. 5d. out of income from reserves. I may be permitted to call attention to page 21 of the report which I was commissioned by the Government to make on schools in other parts of the world. On page 21 most of the figures were checked by reference to the local authorities concerned. Of course the report is dated four years ago, and is four or five years behind the information in E.–1. You may take it that the cost in the countries named is not less now than it was. The cost per head of population in England and Wales, for primary education, in 1906 was 12s. 3d., as compared with 16s. 5d. now in New Zealand. In London the cost was 17s.; in Wales alone, 15s. 5d.; in Scotland, 12s. 4d.; in Ireland, 6s. 7d. I refer to the expenditure from public sources. Then I should like you to compare the cost in New York and Chicago. On page 44 you will find that the total cost of the maintenance of schools, including elementary and high schools and training colleges for teachers, but excluding parental schools, which are like our industrial schools, was £1 1s. 7d. You cannot separate, in the case of New York, the primary from the secondary expenditure. So for the sake of comparison you must add in this case 2s. 3d. to the 16s. 5d. in New Zealand, making the cost of primary and secondary education per head of population 18s. 8d. in New Zealand, and £1 1s. 7d. in New York. In Chicago, which you will find on page 62, they spend for all purposes, primary and secondary, 16s. 9d., exclusive of new buildings. I think that is a fair comparison. It is not an easy thing to make a comparison; you always have to allow for a possible error; in many cases you see different headings which may overlap one another, and unless you can get the figures analysed by the local authorities they may not be of much use. The cost is given for Switzerland, but of course the conditions are so different that I have not brought it into this comparison. The average pay for teachers, for instance, is only £44 per year. As to new buildings, I am not at present making any suggestions as to what ought to be done. If the Commissioners want suggestions from me they may get them by questions. I should like to point out, however, that in New Zealand a large number of new schools have to be erected in country districts as part of the cost of settlement. It is very different indeed (see pages 20 and 21 of the pamphlet) to find money for schools which have an average roll of 294, as in England and Wales; or, as in London, of 803; or, as in Wales, of 239. The average roll of the schools in New Zealand is 76. That is one point to which I should like to call attention—the cost of small schools is really part of the cost of settlement, due to sparseness of population for the time being. Then, again, the large amount of expenditure on the maintenance of buildings is due to two facts. First of all, most of the schools are of wood, and they cost nearly twice as much for maintenance as brick. We give the Boards grants on the basis of the recommendation of the Education Committee (see I.–13, 1903, which is out of print). They get 3 per cent. for maintenance, including repainting, repairs, and so on, for each wooden building. They also get an allowance on a certain scale for rebuilding, amounting also to not quite 3 per cent. on the total cost of the building, reckoned at present prices. They have got that every year since 1903—before that the votes were on a different scale altogether—until the year 1909. In 1909 there was a cutting-down in the expenditure, and the vote for rebuilding did not appear in the estimates. Now the amount allowed on brick buildings is 2 per cent. for maintenance and about 1 per cent. for rebuilding. The consequence is that it takes about 3 per cent. to provide for the maintenance and rebuilding of brick schools, and about 6 per cent. to provide for the maintenance and rebuilding of wooden schools. That is one of the reasons why the expenditure on buildings is so large. Secondly, the amount spent on new buildings and additions—£49,000 in 1910, and it has risen considerably since—is simply due to the progress of new settlement. How far that expenditure can be reduced by the conveyance of children comes under another head. There is another table which I will not quote at all, but will just direct your attention to, and that is table N3, page 61 of E.–1. It is generally acknowledged now that that table is one that is subject to most error. There are corresponding tables for Switzerland, Chicago, and New York given in the report of my visit to schools in Europe and America which I will not refer to at present; but I will answer any questions that may be necessary. There is still one more table, N4, which concerns the efficiency of the system as a mechanical system —I am not speaking of the efficiency of the instruction—by showing the number per ten thousand of the population. It shows the proportion of pupils under instruction in the several branches of education. That is shown in the table for the several years beginning 1898 and ending 1910. I may say, although we are not so high as Switzerland or Germany as regards the number receiving

secondary education, we are higher than Britain or America. I think the general question of educational efficiency is a question that covers a very wide ground, and if I began on that I should have to make a discursion over the whole realm of education. I would rather answer questions in regard to that. I come now to the administration of the Central Department: I shall take this to apply to the internal administration of the Central Department. The Central Department has several officers under the statute. It has an Inspector-General of Schools, and a Secretary of Education specially named under the statute. It also has Inspectors of Manual and Technical Education, and Inspectors of Industrial Schools, which do not come within the order of reference. It has also Inspectors of Native Schools and two Inspectors of secondary schools, to carry out the provisions of section 97 of the Act. One of these Inspectors of Secondary Schools is called the Assistant Inspector-General of Schools, because he controls the administration of the Inspection Branch of the Department. I think these are all the statutory officers, except one who is also Secretary of the Superannuation Board. Then the Department is divided for administrative purposes into several branches. There is the General Branch, to call it by a convenient name, which deals chiefly with accounts and with general matters, especially those concerning Education Boards. The accounts form a very large proportion of this work, and correspondence from Boards of Education and other bodies, unless it specifically relates to a subject that a special branch deals with, goes to and is dealt with by this General Branch. Claims for grants for buildings would go to that branch, because there is no special branch for buildings. All claims for teachers' salaries go to the same branch. The Inspection and Examination Branch is necessarily a large branch. The total number of candidates last year for the special examinations held by the Department for public purposes or on behalf of Boards was over eight thousand. It is not necessary for me to name the examinations: they will be found in the special paper on examinations. It is a supplement to E.–1, and is known as E.–8. The inspection section of the branch, of course, deals with the inspection of secondary schools and district high schools, the classification of teachers and the classification of junior free pupils and senior free pupils in secondary schools. A card is kept for every teacher; it gives the examination results and other facts about him. Then there is a card for each free pupil; there are so many transfers that unless we followed that plan we should get into confusion with the capitation payments altogether. When a pupil is transferred we transfer his card. Then there is the issue of certificates. Under the new system there are intermediate certificates, lower leaving certificates, and higher leaving certificates; and the branch deals with many other matters incidental to inspection and examination. University bursaries, national scholarships, and research scholarships are also dealt with by the Inspection Branch; it also has to do with training colleges and the training of teachers. Then there is the Manual and Technical Branch, which deals with all the grants and capitation, with inspection, with free places and scholarships, in connection with manual and technical instruction. The Native Schools Branch deals with the Native primary and secondary schools, with the education of the Chatham Islands, and apprentice and nursing scholarships given to Maori boys and girls respectively. There are two Inspectors in that branch, besides other officers. Next, there is the *School Journal* and Library Branch, dealing with the *School Journal*, with all questions relating to free books, authorized school-books, and having charge of the reference library, which is available for the use of teachers throughout the Dominion. The same branch deals with all correspondence from publishers, a very large number of whom send samples of books to the Dominion. Then there is the Special Schools Branch, dealing with special schools of various kinds — namely, reformatories for boys and girls, industrial schools proper—both reformatories and industrial schools being included in the Industrial Schools Act —with receiving homes, boarded-out children under the Industrial Schools Act, inmates licensed to service on probation under the Industrial Schools Act, and infant-life protection. There are about 1,500 children under the Infant Life Protection Act. It also deals with the School for the Deaf and, as far as we have relations with it, with the School for the Blind. In the case of the latter school we pay capitation on Government pupils, and inspect and examine the school. There is also the Home for the Feeble-minded at Otekaike, and it will probably be necessary soon to have another. It deals with the feeble-minded, including epileptics. Then we have the Superannuation Branch, dealing with teachers' superannuation. The amount of work is fairly large. There are only three officers concerned in it—Mr. de Castro, who is also Chief Clerk, having two under him. When the quarterly meeting is about to be held they have to use other clerks as well. Lastly, there is the Statistics Branch, which deals also with public reports on education in New Zealand and elsewhere. There is one branch of the public service that was formerly under the Education Department, but is not now a part of the Department—the expenditure is under the Education class, but the head of it is responsible to the Minister directly—that is the Public Schools Cadets Branch. The difference is that I am not responsible to the Minister for the expenditure or for any part of its work. Formerly it was part of the Education Department, and I had to take the responsibility. I have now included all the branches, but I have not included all their work. I have named specimens of their work.

3. *Mr. Pirani.*] I think it would be advisable if you gave us a return of this, showing the expenditure on each branch of the Department, and the special duties of each officer?—I think we could do that quite well. There is one thing I should like to say: One officer is head of the *School Journal* and he is also an Inspector, and in times of great pressure he is called upon to act as an Inspector, because it would be uneconomical to appoint an extra officer when we have an officer qualified for the work. Then there is another thing. If I show the office as it is at this time of the year when the pressure is not so great——

4. I was going to suggest that the return might cover a series of years. You can choose the time when the pressure is greatest if you like?—I will explain, and then draw up a return as you desire. At the present moment we have no temporary clerks. The policy of our Department is

to appoint candidates from the Civil Service list as much as we can. Some men have been kept on as temporary clerks for special duties owing to the special qualifications they have possessed. Three of these have become permanent officers since 1907. But from September to March these eight thousand candidates come up for examination. Each of these sends in a list of subjects on which he wishes to be examined, and many have to send fees. You have to acknowledge receipt, send each candidate a time-table; you have to tell him the result; and generally, with a very large proportion of the candidates, there is some correspondence, because they mark wrong subjects on the lists in their application forms, and make other mistakes; and the lists have to be sent back, and the entries corrected. We use our permanent men—even though young, they are very good—for the most responsible work; and for the more formal work we employ temporary clerks, engaging as far as possible those who have done the same work for us in previous years; so that at that time of the year we have eight or ten extra clerks employed. We take them on as the pressure increases. Occasionally we have one of our typists ill. We do not consider that a capable young clerk, whether boy or girl, ought to be kept merely typing, so if one of our typists is ill we sometimes employ a temporary typist during the period of sick-leave. Otherwise our staff is entirely made up of those taken from the Civil Service Junior Examination.

5. *The Chairman.*] Can we not get a return under these several headings for five-yearly periods, starting from 1890–91 and finishing 1911–12, which would cover a period of twenty years altogether in four five-weekly periods?—To make it fair, I should have to show the work we had to do at each period.

6. I want you to show on one side the difference in the work—the attendance at the schools during each of these five-yearly periods and the additional work cast on the Department in the same periods?—Yes. I will prepare a return under the head of the branches as we work them. I should prefer to do that rather than under the several votes. In connection with the administration of our Department, the correspondence is so manifold in its character that there is one recognized way of dealing with it all, and a junior knows what to do at once. First of all, a letter goes to one branch, and it is recorded in the branch to which it belongs. The great mass of the records are in what I have called the General Branch, but all manual and technical records are kept in the Manual and Technical Branch, all inspection and examination records are kept in the Inspection Branch, special-school records in the Special Schools Branch, and so on.

7. *Mr. Kirk.*] If a letter comes addressed to the Inspector-General, who opens it?—If it is addressed by name, then it is kept to be opened by me as a personal letter; but if it is addressed, as it ought to be, to the "Inspector-General of Schools" it may go to one branch or the other, it does not matter which; but as soon as it is opened the clerk finds out the branch to which it belongs, and it is sent there.

8. Who opens it first?—A junior opens all letters addressed in that general way.

9. Has he sufficient knowledge to decide to which branch it should go?—If he does not know, there is a superior officer near to tell him. The work is so specific that he would very soon know. If it goes to the wrong branch by mistake, it is immediately handed on to the right branch. The mass of letters coming in at one time is so great that if the separate branches did not take the letters that specially relate to them we should hardly be able to get through them in the day.

10. Under that system, then, it is possible that the person to whom the letter is addressed might never see the letter?—Yes; I might not see letters addressed to the "Inspector-General of Schools"; but the person responsible for the matter would certainly get it.

11. It might be dealt with without your knowledge?—It would be impossible to deal otherwise with, say, 80,000 letters coming in; many of them are merely formal letters, asking for copies of regulations, and so on; these letters are not sent to me.

12. *Mr. Thomson.*] A letter would come to you if addressed by name?—Yes; but that is a very undesirable thing to do if prompt treatment is wanted, because if I am away inspecting (unless I have allowed somebody to open my personal letters, which I have had to do at certain times of the year) it might follow me all round New Zealand.

13. *Mr. Wells.*] It would be physically impossible for you to read all the letters addressed to the Inspector-General of Schools?—I could not do it. As soon as a letter reaches the record clerk of the branch to which it belongs it is filed and indexed, and it is his business to see that it is acknowledged and dealt with; it is his business to bring it up until it is dealt with.

14. *The Chairman.*] Apart from matters of routine such as you mention, is there any officer whose duty it is to forward to you any letter dealing with a matter of such importance, in regard to administration, for instance, that you should know of it?—There are some matters in which the policy is well defined. It would be utterly impossible for me to deal with the whole of the matters to be dealt with by the Department if I included these. Some years ago we took a return of the letters, and they numbered 80,000. I have to advise the Minister as to policy questions, and I have to advise as to the drafting of Bills, and a great many other things, so that it would be utterly impossible for me to go into every individual case.

15. What I said was, is it possible for any question involving policy or large administration to be dealt with apart from your knowledge?—All policy questions are supposed to come to me.

16. Are you conscious of any case having been dealt with apart from you where a question of policy or a question affecting the administration of the Act was involved?—There must be cases where the policy is not a new policy. Where the policy has been decided by the Minister or by me as a question of interpretation of what the Minister has decided, then that case may be dealt with without coming to me. In all such cases it will be understood by the Secretary of Education or by the Assistant Inspector-General of Schools that these cases are to be dealt with in accordance with the precedent. If there is no distinct precedent, however, or it is doubtful whether the case comes under the precedent, they come to me, and, as a matter of fact, they do generally come to me.

17. *Mr. Kirk.*] In that case it might be possible for twenty letters, all dealing with a certain matter of policy well laid down, to be dealt with without your knowledge?—Yes.

18. Now, each of these twenty letters might be a letter objecting to the policy, or suggesting amendments?—They would come to me.

19. There may be complaints as to the policy?—We have had one person complaining every year since I have been in the Department. She is complaining against one of the Boards, and she has got the same answer every time, that it is a matter for the Board. She thinks it ought not to be a matter for the Board. I think it should be, and not only that, but the Act lays down that it is. I know she wrote about it this year, because she wrote to me personally. I see no need for me to deal with such cases personally.

20. *Mr. Wells.*] In regard to claims for new buildings, you very often hear complaints about delay: we are sure to meet with that on our journey?—If you inquire into the amount of delay here and the amount of delay in England, you would be astonished to find how quickly we get through them. There are a good many questions to be settled before a grant for a new building can be given at all.

21. *Mr. Kirk.*] There is this aspect of my question: Seeing you have so much correspondence to deal with, is it not possible that some of the letters that come to you could be dealt with by the Education Boards?—We remit everything to the Education Boards within their powers and discretion. I will say that unreservedly. If a letter comes from a teacher about any special matter concerning his school or appointment, or anything except his certificate, it is a matter for the Board, and we are constantly sending replies to that effect. Now and then a new officer may draft a reply which is brought in to be signed by the responsible head, and it may escape notice. I have been in the English Civil Service, and such things certainly escape notice there sometimes. But, otherwise, matters that can be dealt with by the Education Boards we are only too glad to get them to deal with. It is our policy to do so.

22. Your policy is a sympathetic policy?—Decidedly. The Education Boards have done grand work, and if the Education Boards disappeared you would have to have some other similar bodies, if you are going to secure efficient administration. I do not believe in central administration at all. I am very strongly against central administration. I do not believe in the Australian system. As to "The powers and rights possessed respectively by Education Boards and other local educational authorities, and whether they should be extended," I do not quite know what this means; so far as the English of it goes, it would have no reference to the Central Department at all, but only to the Education Boards and other local education authorities. The other local bodies are School Committees, High School Boards, and Managers of Technical Schools, but I do not quite understand the implied antithesis.

23. *Mr. Pirani.*] I will put the position to you this way: Do you think that the powers of these bodies could be extended, so far as you know?—Yes, I do. I might say in this connection that most of my answers will be conditional, and might imply a state of things which do not exist at present. In fact, I would prefer to give my views on this point in committee, when the Press is not present. But I hold, quite apart from debatable matter, that Education Boards should control all local education of what kind soever.

24. That is practically primary, technical, and secondary?—Yes. I assume if they did that they would be popularly elected.

25. *The Chairman.*] Do you mean on a special franchise, or on what is known as the parliamentary one?—I believe in only one franchise for everything in the country. Therefore I naturally mean the parliamentary franchise. That is a general statement. I do not say that they should have all the powers in relation to secondary schools.

26. Do you mean that you would not transfer to them the same power of appointment of teachers that you would give to the primary schools?—I do not think I should.

27. *Mr. Pirani.*] Why not?—I should like them to prove that they were competent before I handed over the powers.

28. Cannot you get proof in Wanganui, where you have the secondary institution solely under the Board of Education?—Yes, as the governing body of the institution, and, if Mr. Pirani will allow me to say so, I do not think that any evil results whatever have come from it.

29. *The Chairman.*] Would not the tendency be in that direction if it were recognized there was a great responsibility attaching to the elector to return men charged with that higher duty?—I think it very likely. I think that is very likely to be so in Wanganui now. What I feel is that, if it came to a question of legislation, it is best to give powers cautiously, and extend those powers afterwards, than it is to give too much power at first, and then try to call it back. It is only caution; it is not disbelief that they may not be able to do it.

30. Would you qualify it by saying a gradual extension?—Yes. There is one thing I think you must not interfere with—in regard to primary as well as secondary schools—with the teacher's methods, or as to how he shall teach the subjects he teaches. That is a most important thing. There is more danger of this, I think, in the secondary schools.

31. You would allow full play to individuality?—Yes, whatever you do. In the secondary schools and in the technical schools there is something to be gained from the freedom in the arrangement of subjects which should be in the hands of the teacher. The arrangement of subjects in a school is partly in the hands of the Boards by the nature of the appointments they make. If you appoint a number of teachers to a school, and not one can take botany, you thereby cut out the teaching of botany in that school. The questions of appointment and management are not distinct. I think you must allow full freedom of the arrangement of the work of the school, and full freedom of the arrangement of the work of the teacher and his methods. If you can secure that, then I think the local body is perfectly justified in saying what courses of study the schools shall take up.

32. *Mr. Pirani.*] Whilst on secondary schools, do you not think it would be advisable to have a scheme of classification of teachers, and for payment of teachers, in the same way as in the

primary schools—of course, I do not mean exactly the same?—In the case of the primary schools, they are financed by the Central Government. We pay over the amounts; unless you alter your method of control, you cannot do that with the secondary.

33. That is subject to your suggestion that the control is in the hands of the Education Boards. But you must alter the method of control?—I am putting qualifications on that.

34. You first said you would give the Education Boards, elected on a different basis, the control of the secondary schools, but not the control of the appointment of teachers: who would have that control: surely the Central Department?—No.

35. Who would have the appointment of teachers?—The governing body, as now in New Zealand and in England.

36. What governing body?—It is called the "governing body."

37. Who would be the governing body under your system?—The governing bodies would be restricted, so that they could not determine what courses should or should not be taken in the schools.

38. Before you mention that at all, you said you were in favour of one body having control of the whole of the primary and secondary education in their district?—You have quite misunderstood me. When I say control, I mean general control. What I want to see is that this body—Education Board or whatever name it gets after it is altered—this local authority on education should have a general control over all branches of education.

39. You do not mean the abolition of the secondary boards of governors?—I think it would be still most necessary to let every school, whether primary, secondary, or technical, have its own board of governors or managers or committee or whatever you call it. Let each have its own board of managers. I will put it this way: that the local authority—that is, the Education Board—commensurate with the present Education Board in importance and area of control, should have general control of all local education.

40. *The Chairman.*] Up to the point of the University?—The University is now generally held to belong to the sphere of non-local education. I regard university education as a question of national importance rather than of local importance: the other branches of education are more local in character.

41. Assuming, for the sake of argument, that it is possible to make the education district coterminous with the University one, would the local authority up to that point have general control over all education matters, save and except the University?—Yes.

42. Where would you put training colleges?—I would take them right out of local education. The training of teachers is higher education, or, at all events, non-local education. Now as to "The expenditure on manual and technical instruction, and the question of local responsibility in regard to providing portion of funds therefor": there are two questions there. The expenditure, I have already pointed out, is down under the vote for manual and technical instruction, and is partly for manual instruction in schools, primary and secondary, and partly for technical instruction and continuation classes in so-called technical schools and technical classes. I shall put in a return showing the amount paid for manual instruction in primary schools, the amount paid for manual instruction in secondary schools, the amount paid for continuation classes, and the amount paid for technical instruction proper. It will show under separate headings what the expenditure in each branch is. In regard to the question of local responsibility, and providing part of the funds therefor, that is part of the debatable matter already referred to. Now, as to "The amalgamation of local governing or controlling bodies": no doubt three of the Boards are far too small at the present time. Whatever theory you have of the duties and powers of Education Boards, Marlborough, Westland, and Grey are too small. I am not at all sure that Auckland is not too large. I am inclined to think it is. It depends on what theory of education control you are proceeding on. As to "Overlapping and duplication": first of all, it does not necessarily follow that all overlapping whatever is to be avoided. For instance, if a boy's day-school life ends at fourteen, it seems to me appropriate he should get some of that kind of attention which he would get at a secondary school if he were to go on to a secondary school after the primary school. That relates to strictly mental training and to moral training also. In such a case there would be justification for some overlapping between the primary schools and the secondary schools. Also, there may be some boys and girls that would gain by an earlier beginning of their secondary-school course. In my opinion, these are few in number, if by an earlier period you mean an earlier stage of education, and not an earlier age. However, there may be ground for some overlapping on that account. There may be apparent overlapping also in the case of technical schools and secondary schools, because some of the same subjects may be taught in both. I think the proper way is to look at the course as a whole, and see if the courses are the same in the two schools. There may be an amount of apparent overlapping in the technical education that is given in the higher departments of a technical school and the technical education that is given more properly at the University. It is most easily explained by a reference to one of the professions, say that of engineering. In my view, the function of a technical school in engineering is to train apprentices, fitters, foremen, submanagers, or managers of branches of engineering works; the function of the University is to train professional engineers who presumably satisfy the conditions that are required for the general management of engineering concerns and for direction and consultation. You may have a branch of engineering taken in a technical school with the same name as a branch of engineering taken in the engineering school of a university college, but it would be approached along the line suitable for a professional man who has had a complete training in the theory and practice of science beforehand; whereas that in the technical school is given for the man whose training has been from that of the apprentice and fitter and foreman upwards, and therefore mainly practical and only partially, as it were by chance, scientific. The methods of teaching would be different in a great degree. Therefore, when it

comes to saying which engineering classes should be taken at a technical school and which at a university college, one of the questions to be considered is what the character of the work is. Another question is the question of cost. A professional engineering education is an extremely costly thing.

43. To the State?—Somebody has to pay for it. In some places the State does not do much; the individual has to pay. I will take the case of Auckland as an example, or perhaps the simpler way would be to put in the report of a conference on overlapping held in Auckland last year. I will merely state in evidence that a conference was called by the Auckland Education Board to consider the question of overlapping of primary, secondary, technical, and university education. It was held at the Training College, Auckland, on the 26th July, 1911. I was asked to be present, and, when I appeared, was voted to the chair. This report to which I refer was the report I was directed to sign on behalf of the whole conference. It gives the views of the several authorities, and incidentally my own views too. Evidence was taken from the University point of view too. Professor Thomas, Dr. McDowell, and Professor F. D. Brown represented the University. I can explain the position in regard to this, because it is a subject to which the Department has devoted a good deal of attention. I should like to call attention to a section of the Act of 1908, which concerns overlapping, to show you how we interpret it. It is section 180: "The Minister shall refuse to recognize any special, associated, or college class in any subject if he considers that sufficient means of instruction in that subject are already provided by classes under this part of this Act within a radius of five miles from the place where the class seeking recognition is to be held." The Department in any other case of recognition of schools or classes that depends on the Minister generally advises him that even if it is not a subject provided by classes under the Act, if it is a subject open to the public under equally favourable conditions, that we shall construe the provisions as to overlapping in the same way. If it is at a secondary school, for instance, if it is a class equally open to the public with the classes that are under this part of the Act, we shall not recognize both classes, if the question is one that by law is within the discretion of the Minister. It applies to such places as the Elam School of Art. We have refused to recognize at the Elam School of Art classes that would clash with the Auckland Technical School and to recognize classes at the Auckland Technical School similar to those that were already recognized at the Elam School of Art. Both of these are classes under that part of the Act. The Elam School of Art is one of those named in the Twelfth Schedule to the Act. As to "The finance of Education Boards, high school, and manual and technical governing bodies": that is one of the orders of reference that I would suggest we should take in committee. Now, as to the heading, "In what respects school instruction can be improved and made of more practical value in equipping pupils for their future careers": that is another very big question indeed. Of course we hear sometimes a great many demands from business men from time to time that they shall be supplied, so to speak, with boys and girls who are fully equipped to take up the work of an office, whose handwriting is formed to the style that that particular office approves, and whose arithmetic is technical to such a degree that they can take up the particular calculations required in that office, and generally that they are to be worth probably three or four times as much as the 5s. or 10s. a week that is offered. (We hear all sorts of demands from time to time that if they do not mean that mean nothing at all.) I do not suppose anybody in the Commission would have any sympathy with such a demand, and I do not know whether it is worth while discussing it. I want to go a little further, and say it is far more valuable to train boys and girls in such a way as to make them capable of using their brains or intelligence for any special kind of work they are going to do than to make fully qualified junior clerks or typists, or any other finished product we might succeed in getting by special methods. I say that as a general remark to save me from being misunderstood in what I am going to say next. I strongly believe in vocational training right through the school life. By "vocational training" I do not mean the kind of bread-and-butter training I referred to just now—the production of finished products able to take a place in office or shop. By "vocational training" I mean that the subjects of the training should be chosen so that they have some bearing on the future life of the pupil. I hold that if you are going to teach the pupil in the best way you must consider his present environment and his future life. By considering his present environment and future life you are really coming closest of all into contact with nature, with things as they are, and the closer you come into contact with things as they are the more points of sympathy there are with the child, and the more successful your education will be. That is general. To be a little more particular, I think that formerly our primary education and secondary education were what is generally called too literary, but what I would call too formal in character. There was too little for the children to do, too little practice in exercises that would establish a connection between the brain and the hand and eye. Subjects and methods of instruction were so far removed from the children's own experience of things that school-work got to be looked on as something that had no relation whatever to life. As soon as you get a child to think that it does not matter whether he does his school-work well or badly, because it has no practical relation to life, you have really lowered his moral plane; and one of the most remarkable things about our system in all British countries in past years is that it has produced a state of things in the school by which the pupil forgives himself with the utmost ease for a complete neglect of all his school duties, and his fellow-pupils back up his judgment. Nobody regards it as a disgrace to leave school-work quite neglected. That is the case in an ordinary school in almost any British country that I know of. I do not put that down to the fault of the children so largely as to the fact that we have made school life too artificial, and have separated their life interests in the present from their life interests in the future. I feel very strongly about that; whatever shape you are going to give to instruction, it is most important that you should sustain interest by linking it with the child's own life and experience. All sorts of opinions are held as to whether you should teach grammar at all in the primary school, or to what extent

you should teach it, but all would be agreed that to teach to the extent to which it used to be taught in the past did not command the respect of or interest the child in any degree. When I mention grammar I represent the extreme position of the old system. There was too much grammar. The same remark applies to what was called "formal arithmetic." Even in our syllabus now, for which I take some responsibility, there are too many rules of arithmetic, and in our schools I believe too much time is given to arithmetic. I am taking arithmetic as a sample subject, because there is less debate about this than about grammar. To some people grammar is a sacred thing that you must not touch, but there are fewer mathematicians in the world, and people can with more impunity throw stones at arithmetic than at grammar; but really the position is exactly the same for the two. In regard to arithmetic, if they were to do hardly any arithmetic but questions that would be absolutely suggested by the practical concerns of life, they could in the process be taught all the principles it is necessary they should know. That is what I hold, and if I had time I should like to tell the Commission my experience in seeing it taught in what I consider one of the best schools in the world—the school attached to the Teachers' College at the Columbia University at New York, where any question that did not arise out of the common daily life was absolutely prohibited; and yet the command of arithmetic possessed by the children in the upper classes there would shame most of the children trained in any school in the British Empire. If we can do that in regard to all our subjects, including reading, we shall have made a great advance in regard to the primary schools. I do not believe in the ordinary miscellaneous reading-book at all. I believe that in teaching children reading you should teach them entirely out of interesting books. I should teach my own children in that way, and I do not see why I should teach other people's children in any other way. The *School Journal* tries to follow that line, but the *School Journal* is, to my mind, only one element among many. I would have a large number of continuous readers, containing continuous stories or continuous descriptions. It is quite a mistake to imagine that children will read only stories. Make a description or narrative interesting, and they will read it. As to the teaching of science, whatever science it is, whether nature-study or physics, the method should be that you use only subjects that can be brought within the child's own experience. That is why so much emphasis is attached to nature-study now, because nature-study properly means study of things that are within or that can be brought within the child's own experience—the study of things at first hand. I think that will be a sufficient indication of what I mean about bringing primary education closer into contact with life. As regards secondary education, I would have vocational courses in every secondary school in New Zealand. Because of the demands of professional examinations, you must keep the general courses in the schools for a certain number of boys and girls. What I mean by professional examinations are those for law, medicine, and the church, because the preliminary examinations for these professions require certain subjects. It is also desirable to keep up these courses for another class of students which is not very numerous, but is still an important class—the class which deals with pure learning, with Latin, Greek, and other foreign literature. It is not desirable we should lose that class, and we have got to teach more than the number in that class in order to secure the full amount of pure learning in the end. I would have, probably in every secondary school in New Zealand, a commerce course. By that I do not mean you should have a course that would turn out expert clerks, but a course in which the subjects were so chosen that the pupils would come to understand the principles on which commerce is based, and have a knowledge of the science and arts with which it principally deals. I should say I would have in every boys' secondary school in New Zealand an agricultural course provided. I would have also what might be called a course of applied science, leading up to engineering and other branches of applied science. In the case of girls I would have domestic science or home science courses. The reason for the agricultural course is partly based on my conception of the importance of agriculture in New Zealand. I hold there is no calling in New Zealand that is anything like so important as agriculture, and I do not think there is any calling that is likely to be so important for a good many years to come; and if we are not going to train up our boys and girls in New Zealand in a knowledge of agriculture, and—what is equally necessary—train them to know the way in which to approach the higher knowledge of agriculture—then we shall be making a fatal mistake. The mistake has gone on long enough now, and the sooner we cure it the better. Another reason I have is this—a negative reason, it is true—that I shall not be doing any harm to the boy or girl who is not going to take up agriculture. Agriculture essentially deals with the prime facts of nature, and therefore you deal with things that every man and woman is interested in, because they are prime facts of nature. That I hold as fundamental. I also hold this: If you want to get a training in science, it does not matter what the specific subject is, provided that the method of teaching is right. It is just as good, for instance, to teach a boy to find the specific gravity of milk, as an example of a liquid, as to teach him to find the specific gravity of sulphuric acid or of alcohol. In the case of milk you are dealing with a thing that the boy sees every day, whereas the first time you introduce sulphuric acid to a boy he does not know what it is, and very likely burns his finger before he knows what it is. What I say is that you can get a training in scientific method from subjects of agricultural knowledge as well as from other subjects. Therefore, you are not doing any injury to a person you train in agriculture, even if he is not going to be an agriculturist. I do not believe in making separate schools for agriculture, commerce, domestic science, and all the other different compartments into which you can divide the training for life. I do not believe in making separate schools—first, because in New Zealand you cannot afford them all. We might be able to afford them in one centre—Auckland—and possibly in the other three larger centres, but we cannot afford them everywhere. In most places we can afford only one school for secondary education. Secondly, you would have so many subjects common to the different courses that if a pupil had to change his course you would have to alter only a small part of his time-table, and not the whole of it. For instance, may I take as an example the course

in applied-science course and the general course, which might be considered to be widely different? In the first two years in both courses pupils would take the same English, the same mathematics, the same history and civics; they would take one science, at all events, in common; they would take the same language—a modern language—that is, if they took any foreign language at all. They would take the same drawing, the same physical exercises. In fact, they would have three-fifths of their work in common; so that those who changed their course would have to change probably only two-fifths of their work, instead of having to change the whole work as they might have to do if they went from one school to another. You cannot tell at the age of fourteen what a boy or a girl is going to be, and still less can you decide at an earlier age. The great mistake (now being recognized even in Germany itself) is that with separate schools for separate courses the parent has to make up his mind when the child is nine years old (or, on the Frankfurt plan, at the age of twelve) as to what course the child is to go through right to the end—that is, until he is nineteen; if he does not complete the chosen course he spoils it by a serious break in the middle. In order to avoid that we ought to have these various courses at the same school. It is more economical educationally as well as financially. That is my general view in regard to the safeguard against overlapping. The alleged overlapping may be illustrated by one or two cases—namely, those of Auckland and Napier. The technical school in Auckland proposed to start commercial classes. These commercial classes would be of all stages—junior commercial classes that relate to the intermediate stage from thirteen to fourteen to fifteen or sixteen years (the junior-free-place period) and senior commercial classes that relate to the senior-free-place period, from fifteen or sixteen to eighteen or nineteen years of age. We draw a distinction between these two stages because we think with certain authorities in the world—the Chamber of Commerce amongst others—that it is no use trying to make a clerk at the age of fourteen years: that at that age the boy wants his general education extended in a way he was not ready for before. At fourteen years he has come to an age at which his bodily and mental powers are both beginning to mature; he is in a state of adolescence. You therefore ought to give him that education, though it may be vocational in tendency, at the secondary school, so as to extend at the same time his general education. We therefore asked the Auckland Grammar School Board of Governors whether they were prepared to give such a course—the junior commercial course—in the Auckland Grammar School. They said they were not prepared to give it to all who applied for admission to the school. (I am not condemning them for saying so: they were already giving it to a certain extent.) Partly for that reason, and partly because in Auckland there is room for two schools of secondary rank, we agreed to the establishing of commercial classes of both grades, junior and senior, at the Technical School. We agreed to these classes because the Grammar School was not prepared to make any fresh provision for these pupils. At the same time, bearing in mind what has happened in New York, where a special high school of commerce was established, I still think it is a mistake to attempt to set up classes or schools that deal with commerce alone; for I may mention, for the information of the Commission, that at the New York High School of Commerce all courses are now taken, the school authorities having found that if they did not establish other special courses they would lose pupils who wanted to give up the commercial course and take another one. It is no longer therefore, solely a special school of commerce. In the case of Napier, the High School was not prepared to take up a commercial course, and, even if we had wished to interfere, we could not have compelled them to do so. It therefore seemed necessary that we should recognize the course at the Technical School. Napier is really not big enough, in my opinion, to run two schools of a secondary character for boys or two such schools for girls. In regard to applied science, the case is not quite so clear as it is in regard to commerce. Only very large schools can afford the apparatus and equipment necessary for running even the preliminary stages of a vocational engineering course, so in my opinion in New Zealand those who are going to be engineer apprentices at an early age should take their work in connection with an institution already provided with the apparatus and equipment. Wanganui is rather a case in point: the Technical School is already well equipped; it would be a mistake to try and set up another such school in the district.

WELLINGTON, SATURDAY, 1ST JUNE, 1912.

GEORGE HOGBEN further examined.

44. *The Chairman.*] Will you please continue your evidence in regard to the orders of reference not yet dealt with?—I will now deal with "Agricultural instruction and rural courses." I would ask permission to refer to page 83 of my report on a visit to schools in other parts of the world, and particularly in America. The table there, I think, almost explains itself. This is the scheme of agricultural education as I think it should exist in New Zealand. Nature-study should be taken by all primary schools. It is now compulsory in the syllabus, and probably is taken by nearly all schools with varying degrees of efficiency (as is very natural, I suppose, with teachers of all kinds of qualifications). I think it is still necessary to emphasize nature-study more than it has been emphasized yet. I am speaking generally; I do not say in every school; some schools have taken it up in an adequate manner already. I should like to intercept a remark here to prevent a possible misconception; when I emphasize nature-study and when I emphasize subjects of manual instruction and science I do not intend thereby to lay less emphasis on the teaching of the mother-tongue. The teaching of the mother-tongue is the most important work of the schools, and must occupy, whatever else happens, the principal place, not as a mere formal language study, but simply because it is the vehicle of expression of all thought whatever. Then, in the

upper classes of the primary schools, I think that elementary agriculture or gardening along lines that will help towards agriculture should form part of the work. I should like to see it in all schools: merely as an extension of nature-study I should like to see it in all schools. It should certainly be taken up in every rural school or in every school in a small town. Small towns are centres of country districts, and what they do the country schools are likely to do. In some districts dairy-work might be taken in an elementary manner in classes Standard V and Standard VI, particularly in the districts where dairying forms the staple industry. To that extent work in the primary schools would be vocational; but it should not be vocational in any sense that would interfere with its efficiency as an instrument for making citizens. I will now come to the next period of school life—the first part of the secondary period corresponding to the intermediate-course or junior-free-place period. There the city high schools should begin to make their science strong; it should not be too highly specialized, but the vocational aspect should be borne in mind. The most important thing is that the scientific method should be acquired. In the country high schools I should like to see the main science always elementary agriculture. The same remark would apply to the district high schools. For those who have left school at the earliest age possible—namely, fourteen—or on passing the Sixth Standard, there should be afternoon and evening classes—continuation classes—and all those in the country should be given the opportunity of course in agriculture and dairy-work. It is quite necessary that you should add to that the further study of the mother-tongue, so I put down in this list English and agriculture. I put English there for two reasons. It is found as a result of experience that in any technical work those attending the continuation classes are crippled unless they have the power of expressing themselves—describing what they see and what they do—in clear language, and the practice in English need not be widely separated from the practice in agriculture, if they are constantly made to give concise accounts of their experiments and observations. But, in addition to that, I have another reason why I think English should be taught in the country continuation schools. One of the objections to country life, which is no less strong because it is very often unperceived, is the drudgery that seems to be associated with the occupations of the farm. If you want people to go into the country you must make country life as interesting and as human as you can, and if you can give your country people some interest in their own literature, without attempting to be too pedantic or too academic in your methods, you will have helped to relieve the monotony of country life. You will help to make the country school one of the centres of social life as well as the place where instruction is given. In the last two years or more of the secondary stage the work of the first two years will be continued, the only difference being that it will become more markedly vocational or even technical. That is, in the senior course, whether taken in the day secondary school or in the continuation school. The age of the pupils would generally run from fifteen or sixteen to eighteen or nineteen. The great majority of them would be earning their own living. So far we have failed in New Zealand to get many pupils of this age in our agriculture courses. I am bound to say that the efforts made to get them by some authorities have not been very strenuous; but other authorities have made great efforts, and have not succeeded much better. There are great difficulties in the way, and the greatest difficulty of all is the lethargy of the farming community itself. The farming community in New Zealand has not yet been converted to the necessity of training the future farmer to understand the scientific basis of agriculture. I am speaking generally. Here and there you find groups of people that have been converted to that idea. In some of these latter cases the difficulty, I think, has been that the arrangements for the classes have not suited the work on the farms. The cows require milking, and there are many operations that can be carried on only in daylight; it is no use expecting farmers' sons and daughters to go to the classes when the work of the farm peremptorily demands their attention. We ought to arrange more for winter afternoon courses, and for courses taking up only, say, two or three afternoons a week during certain months when farm-work is slack. I would refer the Commission to what is being done, for instance, in Minnesota, Wisconsin, Michigan, and other parts of America. I referred to that in my pamphlet; but the work has been extended still more since my visit. To do this work in New Zealand well, high schools and district high schools and ordinary primary schools have to work together. We cannot afford to find separate buildings and provide separate organizations for all the work of agricultural instruction that ought to be done. That is an additional reason why there should be a general control of all local schools by one authority. After the age of eighteen or nineteen agricultural instruction should not cease, but it will necessarily become more diverse in form. First of all a small number will be going on with their special studies in agriculture. A small proportion of these will give up four years to study for the degree of Bachelor of Agriculture or Bachelor of Veterinary Science. Others who will not aim quite so high will still do a somewhat smaller and shorter course of two or three years at the agricultural college, or dairying college, or veterinary college. These people would be, if they had the necessary practical experience, suitable for Inspectors in the different branches of agriculture, directors of dairy schools, Inspectors of Meat, and so on; and there is no reason why a considerable number of them should not be managers of farms where the size of the farm requires more systematic knowledge than the average farm. We will next take the teachers and organizers of agricultural instruction who are among this smaller number. They would be of two kinds. They would be the organizers and instructors of special classes not necessarily attached to any one school, but often itinerant; and I think the best course for them would be a two-years course at the agricultural college, together with a one-year course at a training college, that they might be acquainted with the conditions and principles of teaching. Then there would be the ordinary teacher in charge, say, of the district high school or in charge of the agricultural instruction at the district high school. I think he should have two years at a training college like all other teachers, and we should provide him also with one year at an agricultural

college. Then, for the very much larger class who are earning their living, we should provide school courses intensely practical, very often associated with experimental farms—probably a large number of the courses not so much academic as of the kind that would be taken by experts of the Agricultural Department; and we should not leave any of these people for the rest of their lives without giving them the means of keeping their knowledge up to date. For that specific purpose there should be short winter courses for adult farmers. This scheme implies experimental stations (which would naturally be under the control of the Agricultural Department) to bring the knowledge up to date, or for special research. I think there should be a general council of agricultural education, because there are so many different bodies concerned in the work that there should be some means of bringing them together. The council should consist of representatives of the Agricultural Department, the Education Department; of agricultural colleges, dairy schools, and veterinary colleges; of the controlling authorities of agricultural classes and farmers' societies. I should like to say that the existing regulations in New Zealand allow for nearly every one of the courses that I have suggested in my report, and most of the courses can be obtained free of cost to the pupils. I should like them to be all free, and I would add that some of the instruction should be compulsory.

45. Will you indicate what?—You would have to give the choice to the individual.

46. But when the individual had chosen, you mean it should be compulsory upon him to proceed?—Yes. Now as to the rural courses taken up. You will find fairly full details of that in E.–5, 1911. Agricultural courses have been taken up by a large number of district high schools and by a few of the secondary schools. In 1910 complete rural courses were taken up in sixteen district high schools, situated in five educational districts, and the number of pupils taking it up 447. I think it is quite safe to say that more than double that number are taking it up now. I will supply the exact figures later. That refers only to complete rural courses. The number taking up the elementary agricultural course in primary schools was alone very much larger. It was 15,159 in 1910. Speaking of the rural course in district high schools, the rural course was suggested to several Boards controlling district high schools in a general way some years ago, but in a more specific way in a circular issued by the Department two or three years ago, and a regulation was passed by the Governor in Council giving £5 10s. per annum additional payment on account of each pupil that took the complete rural course. Grants have also been given for the necessary buildings—laboratories and workshops. I will supply a return giving the figures in connection with this expenditure and the number of pupils attending the courses. This is the course that was suggested enabling the district high schools to earn this £5 10s. grant: English, four hours a week; arithmetic and book-keeping, four hours a week; geography, one hour a week; civics and economics, one hour a week; drawing to scale and elementary building-construction for boys and hygiene or physiology for girls, two hours a week; woodwork—boys, cookery—girls, two hours a week; elementary physiology and anatomy of farm animals—boys, household economy or housewifery—girls, one hour a week; elementary physics and farm economics, two hours a week; agricultural science and rural economy, three hours a week; dairying, one hour a week; physical instruction, one hour a week: total, twenty-four hours a week. We recommended a similar course with a little modification for country high schools. The £5 10s. is payable only to district high schools; the secondary schools have already a secured finance. Certainly some of these subjects get the ordinary capitation for manual instruction besides, which in the case of schools is considered enough to pay for the material. There is a certain number of the secondary schools that are taking this work. I should rather not say too much on the degree of efficiency already reached in some of them, because they are only just beginning the work, and it would not be fair to criticize them. Moreover, in several cases the staffs are not sufficiently qualified for the work; while anxious to do it, they are only feeling their way. But I can name without any odious comparison one or two schools where the work is being very well done. I will mention one of them—Palmerston North High School. I do not say there are not several others doing it as well or nearly as well; but I have inspected that one personally. Among the options allowed to pupils at Palmerston North is a fairly complete vocational course dealing with agriculture and dairying, and the pupils who go through this course have proved themselves on being tested not only to have a sound knowledge of the foundation of agriculture, but to have a thoroughly good general education, as regards, at all events, the two main characteristics—knowledge of and taste for English literature and knowledge gained practically of scientific method. They are, in my opinion, the only two essentials of education.

AUCKLAND, TUESDAY, 4TH JUNE, 1912.

GEORGE HOGBEN further examined.

47. *The Chairman.*] We shall now be glad to hear your views with respect to clause 10 of the order of reference—Scholarships and free places: what changes, if any, should be made in this connection?—A summary of the facts with regard to scholarships will be found on pages 44 to 47 of Parliamentary Paper E.–1, 1911. Free places are tenable at secondary schools, district high schools, or technical schools, or, in the case of those of predominantly Maori birth, at Maori secondary schools. The total number in 1910, the last year for which we have complete returns, was 7,540. A junior free place is obtained in one of three ways—(*a*) by the gaining of a Junior National Scholarship or an Education Board Scholarship, or a scholarship given by the Governors of a secondary school; (*b*) by qualifying for a scholarship, though not obtaining one, or by passing the Department's examination for junior free places; (*c*) by gaining a certificate of proficiency

in Standard VI of the public-school syllabus. As far as regards scholarship-holders, and those who qualify for free places by qualifying for the Scholarship Examination or by passing the Junior Free Place Examination, I believe that the standard is uniform throughout the Dominion. All candidates take the same examination. The scholarships awarded by the Education Boards are given on examinations held by the Department, the results being forwarded to the Boards; but as regards those who obtain free places through the certificate of proficiency the standard varies to some extent, as the Inspectors of the different districts do not, apparently, require quite the same standard of work for the certificate. It is extremely difficult to arrive at an exact judgment on the point, but that is the conclusion to which one appears to be driven from the facts. I see no reason why the Junior National Scholarships and the Education Board Scholarships should not be amalgamated into one system. You could call them all Junior National Scholarships or Education Board Scholarships. They should be awarded by the Education Boards on the results of a uniform examination, as at present—that is, if the system of scholarships is to be adhered to. As to the total number of scholarships, out of 563 that were held in 1910, there were 172 of the value of £20 and upwards. The remainder were of a less value than £20. I take it that the 172 approximately represented the number of scholarships held by country children in that year. I am not convinced that it is necessary with a free-place system to give scholarships to town children, or children living near towns, unless they be small scholarships, sufficient to pay for books and similar expenses. I consider that the money set free by adopting such a system as that might be devoted to increasing the number of scholarships awarded to country children. Some of the Education Boards have already moved in that direction. The necessity of giving scholarships under the present system is, of course, obviated by the fact that all those qualified for scholarships can get free places. Personally, I think there is a great deal to be said against the competitive scholarship system. The element of competition, and its effect upon some of the teachers and a good many of the teachers and children, is not altogether healthy. There is also, undoubtedly, a certain amount of hardship from the fact that some children may fail to get scholarships, either from the accidents of examination or from the fact that their best qualities are not tested in the examination, while others, either from special coaching, or special aptitude for examination-work, or from other causes, may win scholarships. Again, the standard reached by the lowest scholarship-winners may vary considerably from year to year, so that the degree of merit sufficient to gain a scholarship in one year may not be sufficient in another, even though you take the utmost pains to make the examinations of the same standard, and may succeed in doing so. I think that whether a boy or girl gets the help that is called a scholarship or not should depend solely upon the consideration whether he or she has reached the standard which has been settled upon as the standard for further work in a secondary school or a district high school. It might appear at first sight that it would be opening the door so widely that the probable expenditure could not be ascertained, but that has not been found to be the case with regard to free places. For departmental purposes it has been possible to foretell the number of free places very closely, simply by taking the average of the number of scholars qualified to hold such free places. In a similar way, having once settled the standard for the non-competitive scholarships, you could ascertain very closely the number that would probably gain those scholarships and take them up. I prepared a report on this question for the Minister some years ago, and will lay a copy of that report before the Commission later on. (See E.–1c, 1904). In the meantime I can give the figures approximately from memory. I take it that what would be desired would be to give country children in every respect and equal chance with town children. Therefore we should take the number of free places held by town children, compare those with the number that qualify by certificate of proficiency or otherwise, and take a similar proportion of country children, who, presumably, if they had a boarding-allowance, would be pretty well on the same footing with the town children, and take up their free places in something like the same proportion. Taking exactly the same proportion, I found, when preparing my report, that some fifty additional scholarships a year would be required. In revising the figures last year I thought that with the increase of population the additional number would now be between sixty and seventy per year, and I am sure these figures are not far astray. Forty pounds per scholarship is the highest amount I would propose to give. Personally, I should prefer to make it £35. Thirty pounds would be too low, but £35 might be enough. But, taking the amount at £40, the cost of sixty additional scholarships would be £2,400 a year, or, as the scholarships would be tenable for two years, £4,800 in all for additional scholarships. Some of that money—probably half of it—could be saved by reducing the number of town scholarships, or abolishing them altogether—at any rate, reducing them to £5 a year each, to allow for books and other requisites. The State would then have to find £2,800 a year in excess of what is found at present. In 1910 about £9,200 was spent, so under the system I have outlined the cost would be about £12,000. Having established your standard—not a very difficult thing to do if there is uniform examination, or a uniformity in the standard of the certificate of proficiency—every child who came up to that standard would be entitled, if his or her parents desired it, to get a scholarship, which would carry with it maintenance money and also a free place. As a matter of fact, the Boards have not found it possible to award scholarships up to the full extent of the moneys they might use. It is very difficult to spend all the money that is allotted for scholarships, because many scholarships are allowed to fall vacant, from various causes. So that really the increase is rather less on the estimates than even £2,800. I am quite aware of the argument that is sometimes used that many town parents have to make sacrifices to keep their children at secondary or technical schools. It is perfectly true that they have to make some sacrifices—they have to sacrifice the wages that their children would otherwise earn. Touching upon what is perhaps a political question, I do not think we ought, as a community, to give our sanction to the sacrifice of the children in order to help their families

to maintain themselves more comfortably. I think the problem ought to be solved in some other way. However, I will not touch further upon the political side of the question. The point of the argument is this: You would not make the town parents sacrifice more than the country parents if you paid merely the cost of maintenance of the child from the country. That is one reason why I should not make the allowance for maintenance too high. At the same time, you should make it high enough to prevent poor country parents having to find hard cash to pay for the maintenance of the child in town. He will already have to find more in clothes and in other ways apart from mere maintenance, and I do not think the conditions are so unequal that you should not pay the full cost of maintenance. I put the amount at £40, because that is the lowest amount that any secondary boarding-school, so far as I am aware, charges for board. I do not think it is desirable that country children should go to unlicensed boardinghouses, where they have no opportunity for evening work, and no proper supervision. They should go either to houses attached to the school, or houses licensed and preferably under the supervision of a teacher. Therefore you would have to pay a sufficiently high allowance to make it worth while for the high-school authorities or some other proper person to carry on such hostels or boardinghouses. That is the suggestion I would like to see carried out.

48. *Mr. Kirk.*] Would you differentiate between country children with respect to the financial standing of their parents?—No; I do not believe in "poverty scholarships." On that point I feel very strongly. I have had a good deal to do with poverty scholarships in the Old Country. For one thing, it is very difficult to arrive at an exact estimate of the financial position of the parents. There are so many people who take a liberal view of their own impecuniosity—who consider that they have less than a certain income when they have advantages that would really bring them into the same financial position as others. It is difficult to take account of the size of the family. It is difficult to take account of the many financial responsibilities which are hard to put down on paper; it is extremely difficult to run a "poverty clause" scholarships scheme satisfactorily.

48A. Would you be in favour of granting a wealthy man in the country a scholarship of £40 a year in respect to his child—placing him on the same footing as the poor man?—Yes, but the proportion of children of wealthy people who get scholarships is extremely small, and under a qualifying scholarship system it would be smaller still, because some of them now get an advantage in being coached. Under the qualifying scholarships system it would not pay to coach. I hold that under a proper system of taxation, which I presume we must assume to exist, the rich would have to pay in another way.

49. In Wellington you spoke of the teaching of arithmetic and grammar especially. As head of the Education Department have you made any representation to Ministers with a view to having the defects you spoke of removed?—The syllabus has been under review for some time past. It has been discussed by the Inspectors' Conference and by the Educational Institute. I do not like to plead guilty to lapse of duty, because I do not feel guilty; the matter has been crowded out by other things. What the Inspectors and teachers ask for is very little alteration in the syllabus, but a rearrangement to make the work more definite.

50. What do you propose by way of remedying the defects complained of?—There are certain things that I would cut out of the arithmetic. I think there are too many rules taught. In the last revision of the syllabus I would have made the alteration if I could have been sure of the support of the Inspectors and teachers. I did go as far as I thought the people were prepared for. They are all prepared to go further now, and I am prepared to go on with it, and get out the proposals in the course of a few months. Copies would then be sent to the Education Boards, the Inspectors, and the Educational Institute for their remarks. On the return of their replies, if there were any serious differences we should try to arrive at a compromise.

51. As we have to report on the subject, would you give us your views—especially your views as to how the defects in the teaching of grammar and arithmetic could be removed?—It is easier to speak as to arithmetic than as to grammar. Standard V is the first place where I would make an alteration. I would still further simplify the requirements as to vulgar fractions. I would still further restrict the percentage subjects—interest, insurance, and so forth—if not cut them out altogether from Standard V. Still more would I simplify those same things in Standard VI. I would cut out troy weight. I would not insist that the pupils should know the meaning of ratio, though they ought to be able to use it, recognizing that the abstract idea is distinctly one that comes more naturally in the secondary period—the period of adolescence. Then the cards issued by the Department might be considerably reduced in difficulty. Those are the principal things I can point out at present.

52. Would you substitute anything else for those things, or simply eliminate them?—I would not substitute anything else. I would make the arithmetic sound on a few basal principles. What I want the pupils to do is to be able to apply the principles to simple cases.

53. Are you satisfied that the present syllabus gives a reasonable guarantee that the pupil is being turned out trained to use his brains?—I do not think any syllabus can give a guarantee. I do not think the syllabus is the most important thing. The most important thing is the teacher.

54. But the syllabus is laid down. If you depended upon the teacher solely you would require no syllabus?—I should like to have such good teachers that we should need no syllabus beyond a very general indication of the work to be done. I should like to be able to put the whole syllabus on four pages.

55. Have you any recommendation as to that?—I do not think we should be quite prepared for that. Our best teachers are quite prepared, but we have many teachers who have not the experience or the skill that would enable us to leave them so largely unguided.

56. Assuming that the teachers had a freer hand, how would the question of examinations be affected?—I think the less importance we attach to examinations the better, so long as we have

certain necessary tests. If we did not constantly resist the tendency to increase outside examinations—I am speaking as a member of the teaching profession—we should kill education. One of the greatest enemies of education to-day in New Zealand and most other countries is the craze for examinations—outside examinations.

57. Would you say that the pupils in the New Zealand schools are overexamined?—I think they are, but they are examined less than they were. It is the public that demand examinations—it is not the fault of the teachers.

58. Have you considered the question of the introduction of leaving certificates acceptable to the University authorities as a means of entrance to the University?—I believe in it very strongly. I believe that leaving certificates are worth more than the Matriculation Examinations as a sign of fitness for University education. We have made provision for leaving certificates, and we give them.

59. *The Chairman.*] Do the University authorities recognize them as being a sufficient substitute for matriculation?—No. The question whether the matter should be referred to the headmasters of the secondary schools was defeated in the University Senate three years ago by one vote.

60. *Mr Kirk.*] You think the certificate should be accepted by the University?—Yes; what we call the higher leaving certificate should be accepted.

61. Is there, to your mind, sufficient teaching of history and civics in the schools at present?—I do not think there is. I think it would be sufficient if they did all that is indicated in the syllabus.

62. Do you think history and civics should be taught more in the schools than they are?—It is difficult to make a generalization, because the schools differ in practice, and you can hardly average it. Some schools do the absolute minimum, and others hardly seem to touch the subject at all.

63. From the information you have gained, would you recommend that further efforts should be made to teach the subject?—I think the matter should be emphasized more. That is one of the cases in which I do not think you can do much more through the syllabus unless you require history definitely as one of the subjects for the certificate of proficiency. Now it is merely classed with several other subjects. Let me refer you to clause 19, which defines the certificate of proficiency. After stating how many marks per cent. shall be obtained in English and arithmetic, geography and drawing, there is a general subclause to the effect that the pupil must satisfy the Inspector that he has received sufficient instruction in the other subjects as required by the regulations. Amongst those subjects is history. I think we might name history in the list of subjects, as we do geography. Civics and history are one subject. I hold that history gives examples for illustrating civics at that stage, for you cannot go into the philosophy of history then.

64. As to vocational courses, is it not a fact that in most secondary schools students are being turned out unfitted to pass examinations which are, so to speak, the "open sesame" for their vocations in life—for instance, for the pass for law or medicine?—It is rather the other way. There are more of them who take the general course than the other courses.

65. More for matriculation, for instance?—We must take them in proportion to their numbers at the schools. In proportion to the number of those taking vocational courses, not quite so many matriculate, but more qualify for the future professions, because at the schools, and in the courses in which the teaching is directed most to the passing of examinations, a good many pupils pass matriculation; but it does not lead to anything—they do not go on to the University, and are never likely to go. You have increased the number passing matriculation by the number to whom, in my opinion, you have given a wrong education.

66. Do you not think that, just as in Germany, where children are allowed to choose early in life what might be their course, and failure follows, so in New Zealand, where the optional subjects are being taken earlier in life, there may be failure also?—Germany has less choice of vocation than any civilized country that is really a well-educated country. A parent has to choose when his child is nine years old—or, in some cases, at twelve—whether he will send it to a gymnasium or not.

67. My point is that the choice should be made later in life?—It is made later here than in Germany.

68. If in New Zealand we are opening the door still wider, and boys are allowed to choose printing, and typewriting, and dairying, and agriculture, is it not a fact that some boys may fancy farming who may ultimately choose medicine as a life vocation?—That is quite possible; but I do not see how you will help it by making a boy who is going to choose farming refrain from taking a course that may help him by and by.

69. Would it not be better to lay a foundation which will allow of the boy passing an examination which will enable him to go to the University than to teach him subjects which may ultimately be of no use to him, and debar him from taking the course he would otherwise take so as to get to the University?—My answer to that is that you have no business to have a lot of examinations on entrance to a profession, many of them unsuited to the profession itself. Why need a lawyer or a doctor know anything of Latin? There is no necessity for these things in their professions. Much better to have a good general education—to make use of the time he now gives to Latin grammar—for he seldom has more than a scrap of Latin grammar and one author—by taking other culture subjects or professional or vocational subjects. What I said the other day was that, as one who has given a certain amount of time to science, even apart from educational work, I am convinced that a boy can get from the course in elementary agriculture as good a training in scientific method as he can in the more academic subjects, and if you have given him that training you have done all that you can do at that age.

70. You said you did not believe in a bread-and-butter education, which would mean the sacrificing of mental training for considerations of more immediate utility. How do you reconcile this with the teaching of vocational subjects?—They are not bread-and-butter subjects. A bread-and-butter subject is a subject which may be turned to immediate cash value without necessarily giving the student even anything of the principles underlying his proposed profession. The vocational course takes the ordinary subjects, and relates them to his everyday life. A man or boy may take up agricultural science instead of magnetism and electricity, because the life around him is agricultural. In training a farmer you can give him as good a training in scientific method as in anything else, and he becomes fit to go on to another line of science.

71. *The Chairman.*] You could carry that a little further, and say that where a district is supported by a particular industry the vocational course there should have relation to that industry?—Yes, if it is the dominating industry.

72. *Mr. Kirk.*] Can there be reasonable teaching of agriculture in a primary or a secondary school?—I distinguished between the two the other day. I said that in a primary school it was an extension of nature-study, especially associated with the school garden; in such work the pupils become acquainted with the life of plants. That is part of pure science.

73. Which would be applicable to others—those going in for the agricultural course?—Yes, as a general training for life.

74. Apart from that, can reasonable agricultural teaching be done in the primary schools? Would it not be better to leave it for the technical schools, and not take up the primary and secondary syllabuses unnecessarily?—I would not leave the primary course without scientific training. The two important things are the mother-tongue and science. There are really only two subjects in a school—language and science; arithmetic is part of science.

75. Does not a science, to be taught properly, require a science teacher?—Yes; that is why we require all teachers to take science.

76. Are you getting sufficient of them?—We are getting more and more of them.

77. Is the inducement you are holding out to them to take up the science course sufficient to induce brainy men to take up that course?—You do not require a very highly qualified specialist to teach science in the primary schools. What you do want is persons who have got hold of the scientific method.

78. I am speaking of the secondary schools?—In the secondary schools we get more of them. It is partly the fault of the University that we do not get sufficient trained science teachers. For years the University has made the science degree much harder than the arts degree. But the necessity would still exist if you had difficulty in finding teachers. You would have to make more effort to find teachers. I would not propose to cut out science because you find it difficult to get teachers.

79. Is there a dearth of teachers efficient in teaching science? Is there any difficulty in getting them?—There are not as many as we should like to see; but there are a great many more than there used to be.

80. Then, to your mind, the inducements are sufficient?—I do not think they are, quite.

81. Have you any recommendation to make upon that point?—The community must make up its mind to raise the salaries of secondary-school teachers.

82. *The Chairman.*] In other words, you must hold out the hope of promotion to the man who has the qualifications?—That is so. The number of headmasterships is very limited, and they cannot all look forward to such positions.

83. *Mr. Kirk.*] In what relation to life, in your opinion, does the study of the classics stand?—I think that the opinion of many leaders of education nearly all over the world is now that the study of the classics is distinctly a special study. It is less and less looked upon as an instrument for general education. I should like to say that I began my study of classics by taking Latin at the age of seven. Most of my life up to the age of twenty-one was taken up with the study of Latin and Greek. I had a fairly complete classical education, as it is called, so that I am not speaking without a sympathy for the classics. But I hold, with an English headmaster who has made the latest declaration on the point, that for the average boy we are making a mistake in teaching him Latin—we are wasting his time. It is a special study, I hold, and I should be very sorry to see the standard lowered for those who take it up as a special study. I would not cut it out of the curriculum, but I would leave it as an optional subject in the secondary schools. I would keep it for those who are going on to higher work.

84. *The Chairman.*] But would not the professional courses require Latin?—I think we ought to review considerably the conditions of entrance to the professional courses. Latin would be required for the entrance to the course in which a man would take up pure classical learning. I think we should leave it in. We must have some optional subjects, and there are some whose tastes would lead them to it at an early age, but I would let students take a modern language first.

85. *Mr. Kirk.*] Are you satisfied, and, if not, why, that the teaching that is going on is sufficiently correlative between school-work and life-work?—You do not specialize in the primary course. Even what is called elementary agriculture is not specializing, but only putting the students into close contact with their environment.

86. Let the question relate only to the secondary schools?—Speaking generally, I do not think it is.

87. Then, what recommendations have you to make to ensure that result?—I suppose you consider that it is a desirable result?—I hold that it is a desirable result. I consider that there ought to be several optional subjects such as I have indicated. I have indicated a general course, in which you could include Latin as one of the optional subjects. But I do not think Latin is the best classical subject. In my opinion Greek is far better.

88. As the State's corrective school discipline ends just at the time when the life of the boy or girl is changing, is it desirable, in your opinion, that some compulsory system of continuation classes should be made general, so as to keep their minds employed?—You have given grounds on which I should say yes, but there are other grounds on which I should say that you must educate public opinion first. I believe it ought to become compulsory, but I also believe that if you get too far ahead of public opinion you will put off the reform for many years. You may lead public opinion, but if you get out of sight of public opinion there is no chance of its following you. I believe the best way is the way in which we have made a small beginning in New Zealand, making it depend upon local option. It began that way in Switzerland, and is still carried on in that way in Switzerland. It began that way in Germany, and in some parts of Germany it is still carried on so. Local option in the matter failed in some parts of the United States, and that is the dreadful example against it.

89. Assuming that the control of education was given over entirely to the Education Boards, should the powers of the School Committees be widened or restricted, or have you any suggestion to make with regard to the School Committees' powers?—I think the Committees might become somewhat modified. I am afraid that I think their powers ought to be lessened in one or two respects, but in some ways they might be extended.

90. Of course, the demand is that they should be extended?—I think that the Committees as a matter of fact—I do not say as a matter of law—have too much voice in the choice of teachers. I do not say it because of any want of capacity on their part, but because of their want of knowledge. They cannot possibly know.

91. *Mr. Pirani.*] Have they any voice?—I do not say they have as a matter of law, but as a matter of fact.

92. Is it not the way the law is applied by some Boards?—I think the Committees in some parts of the Dominion have too much voice in the selection of teachers, and the misfortune arises not so much because they are not competent, as because they cannot possibly know.

93. *Mr. Thomson.*] Will you explain the law as to the appointment of teachers as it now stands?—It is contained in three long sections of the Act. Section 55 of the Act as now amended lays down the method. If it is proposed to transfer a teacher the Board has to send to the Committee the name of the person proposed to be transferred, together with a statement of his or her service and qualifications. It consults the Committee in this way. In any other case the Board sends a list containing not more than four names of the teachers it considers best fitted for the appointment, stating their length of service and other qualifications, and if applications have been invited it shall also send the list of applicants. In all cases the Board shall give notice to the Committee. In case the Committee expresses its opinion, the Board, having received that opinion, or given the Committee an opportunity of expressing its opinion, makes the appointment.

94. *The Chairman.*] Is it not the case that where four names are sent to the Committee and the Committee makes a recommendation out of the four the Board can set aside the recommendation? Can they legally refuse? Can you tell us of a case where the recommendation of a Committee, after four names have been sent down, has been set aside—where a Board has gone against the recommendation of a Committee in favour of an individual named in a list of four?—My knowledge in regard to matters of that kind is only hearsay. I have no direct official knowledge, but I have heard of it. But that was prior to the present Act coming into force. I do not remember any such case since the present Act came into operation.

95. *Mr. Pirani.*] Subsection (*c*) is very clear. It says, "In any case in which the number of names in the above-mentioned list is more than one, the Committee shall select one of the persons named in the list, and shall in writing notify the Board, not later than three days before the day on which the appointment is to be made, of the selection so made, and the Board shall appoint the teacher so selected"?—That is mandatory. It was put in at the last amendment of the Act. It might seem to be better as a matter of policy to send on more than one name, but I have no hesitation in saying that I think the provision you have just read is a mistake. I think the Board should have the final power of appointment, but the Committee should have an opportunity of expressing its opinion.

96. *The Chairman.*] The Committee should send back the names, with its recommendation; but the Board should have the right of veto, if for good and sufficient reason?—Practically, but I would not put it in that form.

97. *Mr. Kirk.*] You are decidedly against extending the powers of Committees?—Yes, in regard to the appointment of teachers, because I consider that they are not in a position to judge. They are only in a position to get private evidence, or hearsay evidence, more or less remote, or else the evidence of those who interview them. Some of those influences would not necessarily lead to the appointment of the best candidate.

98. You have probably read in the newspapers criticisms upon the policy of establishing so many small schools, and the contention that instead of opening so many schools greater facilities should be given for the conveyance of children to more distant schools. What have you to say on that point?—I agree very much with the idea. I think the advantages where the roads are good is very great indeed. If you were to provide proper drivers and establish the system of proper vans it would be an extremely good thing. But it would not be possible everywhere in New Zealand. I know of one very notable case upon which I had to report at one time. I addressed a meeting of the inhabitants of the district, and the idea was scouted by them. The district was one of the best roaded in the South Island, so that reliance could have been placed upon vans at all times. There was also a railway-station opposite the place where it was desired to build a school, so that the facilities for getting to the train would have been equal to those for getting to the school. Moreover, the train would arrive at a station five miles away where there was a large

and good school at twenty minutes to 9, and there was another train leaving that station at a quarter to 4. There could not have been any conditions more perfect, yet there was strong opposition to the idea of conveying the children by train. The settlers got their new school; but I consider that it was a bad thing for the children, and that the building of the school was waste of money. But the people were very strong in their feeling that they wanted something local; as long as they do not have to pay anything for it the settlers of every little hamlet will put on very strong pressure to get their own little school.

99. As the cost of teaching engineering is necessarily very great, would it not be preferable to have one recognized school of engineering in the Dominion, and by means of scholarships assist the students to attend?—Yes; I have gone very fully into that matter. We are recognizing provisionally in Auckland the classes in engineering that are to some extent of University rank, or are said to be of University rank—recognizing them temporarily, because otherwise we might shut out students from any education of the kind. But there is a recognized school in connection with the University — recognized by the Institute of Civil Engineers, by the Institute of Electrical Engineers, and by the Institute of Mechanical Engineers, so that it has an Imperial standing. I think the best way would be to pay for scholarships at that school. The Canterbury School of Engineering has already cost over £30,000 for building, equipment, and apparatus. They are going to spend another £5,000 on apparatus and equipment, which will bring the cost up to nearly £40,000. The interest on £40,000 at 5 per cent. is £2,000 a year. The expenditure on salaries and upkeep at that institution is now nearly £4,000 a year. Probably when it is fully equipped and fully worked the cost will be £5,000 a year. Thus you have practically £7,000 a year. The school is turning out professional engineers, not merely workshop foremen. In the three branches I do not see how the requirements of New Zealand could possibly reach thirty professional engineers a year. Taking the number at thirty, each qualified engineer would cost over £200.

100. *The Chairman.*] Can you say how many students there are at present?—There are two kinds—diploma students, who do not get the degree, but get the diploma of Associate of Engineering, and those who do get the degree. Those who get the diploma of associate are recognized by the Institutes to a certain extent, and the degree itself is recognized entirely. From the report I find that twenty matriculated students were studying last year for the University, and the total number of students was twenty-six. The course is four years, so that is only about six a year.

101. *Mr. Kirk.*] I take it that there must be some necessary overlapping in the Dominion as far as the teaching of engineering is concerned?—The professional course is not taken anywhere else, except as regards certain subjects in Auckland.

102. Not in the technical schools?—That would not be overlapping. Engineering subjects ought to be taught in the technical schools, because we have all the stages below that of the professional engineer. In most of the older countries the professional engineer reaches his final qualifications by a different road altogether. He begins by a thorough scientific training. He gets a longer training in pure science, or he goes through the University, whereas the number who become professional engineers by going through the workshops is quite small. But I should open the University engineering school to the clever workman who has shown in the workshop and in the technical school his fitness to enter the profession. I consider that there should be an engineering school for apprentices and foremen even where there is an engineering school of University rank, perhaps in connection with the latter.

103. Is there any overlapping in Auckland, for instance?—I do not think there is. If there were, the Minister has power under the Act to refuse to recognize the class. The very reason why he is recognizing the engineering classes at the University is that the standard is different from that of the technical schools.

104. Is there no overlapping in Auckland as between the University and the Technical School? —Yes, but I do not think it should lead to the establishment of an engineering school in Auckland. I know that that is contrary to the opinion of some people in Auckland, but I put my objection on the ground of expense. It would be better to give a student from Auckland sufficient money to pay the whole of his expenses in Christchurch.

105. *Mr. Wells.*] Would you carry that to the associateship standard?—I should like to know what course it was—whether it was the sort of training that would lead on to the professional engineer. I think that every kind of training should be given at the technical school, and that there should be those schools wherever there are engineering-works.

106. *Mr. Kirk.*] As to the cost of administering the Department, are you satisfied that value is being obtained by the State for every pound spent upon the Department in its various branches, or have you any recommendation to make?—If you mean the *personnel*, I am asked to give evidence on that very point before the Public Service Commission.

107. I mean as to the education system?—I think it would be better if a little more were spent upon the Department.

108. Do you think the Central Department is undermanned?—I do. I think that the heads and the semi-heads of branches have to work so much outside recognized office-hours that it should be more fully manned.

109. *Mr. Wells.*] As to the revenue from the reserves, would there be any gain in grouping the reserves?—All the education reserves under the first head I gave are managed now by the Land Boards.

110. Could all the reserves be under the management of one body?—The reasons for that would be a land question, not an education question.

111. Could they be administered by the Boards?—The Boards do not deal otherwise with land questions, and questions of tenure and treatment of tenants, whereas the Land Boards do. If I were a member of an Education Board I should not want to have anything to do with land.

112. *Mr. Thomson.*] The High School Boards manage their own land?—Yes, some of them manage them exceedingly well, but all do not.

113. *Mr. Wells.*] Can you suggest any improvement in the system to enable them to get a better return?—I am afraid of anything that looks like pooling reserves.

114. Could not the tenure be improved?—They can all have the same tenure. Any High School Board can come under the clauses of the Public Bodies' Leases Act, and get all the powers given under it.

115. You have no suggestion to make as to how they could get better returns from the reserves?—I say, let them all come under the Public Bodies' Leases Act. Make it compulsory if you like, but you might have to alter some of their special Acts, because if one of those Acts conflicts with the Public Bodies' Leases Act the special Act runs, not the Public Bodies' Leases Act.

116. You told us that the primary and secondary education in New Zealand costs 18s. 8d. per head of population, and in New York £1 1s. 7d. What is your opinion as to the efficiency of our best schools as compared with their best schools?—Our best schools I should not be ashamed of. If you take two or three of their schools, which are model schools, they are better than anything we have.

117. Take the average work?—The good schools of New York are better than ours in some respects, and ours are better than theirs in others. It is very difficult to sum the matter up. Their teaching of English is better than ours, but all good schools in America are ahead of England and of most other countries in the world in the teaching of the mother-tongue.

118. What can you say as to the relative cost of building in brick and in wood?—If you take it per cubic foot, the cost of wood is from 6¾d. to 7d., except just around Auckland, as against 9¾d. to 10d. for brick. Per square foot of floor-space, if the building is not too high, the cost would be about 11s. 1d. for wood, and 15s. 10d. for brick. You have to add a little more for the cost of the desks and furniture. In Auckland, according to recent tendering, the cost of building is much higher.

119. Bearing in mind the extra cost of upkeep and sinking fund in the case of a wooden building, is it cheaper at present prices to build in brick?—In most places it is. Long before a wooden building is worn out it will have eaten itself out in the cost of maintenance. There are other considerations that enter into the matter besides the question of cost. It is better to build a temporary school in wood than in brick. Some people are afraid of earthquakes, but that matter would not alarm me. The fact that by building in brick you are guarding against fire far better than you can in the case of a wooden building far outweighs any danger from earthquakes. That danger is greatly exaggerated.

120. Are you prepared to advocate the inspection of all private schools?—They are subject to inspection now if the proprietors like to make them so.

121. The Act says that the head teacher of such a school "may" apply for inspection?—But look at the definition of "efficient instruction" in the Act. Section 150, subsection (5), says, "For the purposes of this section, 'efficient instruction' means such instruction as is prescribed by regulations, and, on and after the first day of January, one thousand nine hundred and eleven, means efficient instruction as prescribed by regulations and given to children in their own homes or in a school subject to inspection under this Act." Then section 170, subsection (3), says, "A school inspected in accordance with this section shall thereupon be held to be a school subject to inspection under this Act." The teacher asks for inspection, and the Board must inspect it. That is the only way in which a school can become "a school subject to inspection." If it does not become a school subject to inspection the instruction given at it is not considered efficient. That is the way in which the law compels a school to be subject to inspection.

122. Is that the actual force of it?—That is my reading of it.

123. *The Chairman.*] What was the intention?—The intention was to make it compulsory.

124. Is the effect to do that?—I think so.

125. Then, until the managers of a private school apply you are powerless to interfere?—Yes. It is not a school "subject to inspection," and therefore the education given at it is not efficient, and you can prosecute the parents of any children who attend it. There should be inspection of the buildings also.

126. Is there any power in the Act to compel efficient teaching in such a school?—The Act says "such instruction as is required by the regulations." It depends upon the Inspectors' opinion as to whether there is such instruction.

127. *Mr. Wells.*] I believe that in one of the Australian States every person engaged in education must have a certificate of efficiency: would you advocate that system for New Zealand?—It is only a back door out of it if you register practically every teacher. They do not have to be certificated teachers.

128. Do you not think that every one engaged in teaching should pass some test, and hold some certificate?—That is all very well theoretically, but in that case how are you going to get enough teachers for your schools?

129. Those who are engaged in primary schools are under the eye of the Inspectors. There is some guarantee that efficient teaching is going on?—These are also under the eye of the Inspectors.

130. *The Chairman.*] When you get the declaration of the Inspector, what power have you to get the instruction in the schools made efficient?—That is a matter of the powers of the Boards.

131. *Mr. Wells.*] You suggested that the Education Boards should have general control of the primary, secondary, and technical education in their respective districts: would you include Native schools also?—The Boards are not in too much of a hurry to take Native schools over.

132. Can you tell us how the cost of Native schools compares with the cost of those under the Boards?—You would have to compare them with schools in very scattered districts. There are none within reach of the other schools. I will take out the figures if you desire it. We are not

always quite ready to hand the Native schools over to the Boards when they are prepared to take them. It takes a little time to become a good teacher of a Native school, if it is really a Native school, where the children speak Maori in their homes. As soon as the majority of the children in a school speak English at home I would hand them over to the Board without hesitation. That is our practice, but the Boards are not always ready to take them.

133. Would you allow special representation on the Boards for each of the branches—primary, secondary, and technical education?—If the Boards were elected in the way that I would suggest. I think each branch should have a representative on the Board.

134. Would you favour allowing the teachers of the district to have representation?—I would not allow any one in the employ of the Board to have a seat on the Board. I would have the teachers represented, but not by any one holding office. They might be represented by an ex-teacher if they liked.

135. You are acquainted with the promotion scheme of the Auckland, Wanganui, and Taranaki Boards: would you be prepared to advocate that the Boards throughout the Dominion should be required to have such a scheme of classification, and promote from it?—I think they might very well learn from the experience of the places where it seems to have worked well.

136. Do you not think it should be possible to deal more quickly with growing schools in the matter of staffing and accommodation?—I do not think you could get anything much quicker than the tables of staffing provide for.

137. We have had to wait three months in the case of a large increase?—The Department has gone into the matter of the scale for large schools. A sudden increase otherwise entitling a school to an additional teacher means only the addition of two children per teacher. What does that matter for three months?

138. It is found to be a grievance in the Auckland District. We have a number of very rapidly growing schools?—I should like to have specific cases.

EDWARD KER MULGAN, M.A., examined on oath. (No. 2.)

1. *The Chairman.*] What are your qualifications?—I am Chief Inspector of Schools employed by the Auckland Education Board. I am a graduate of the New Zealand University.

2. You know the order of reference of the Commission. We would like you express any opinions you may hold in reference to the several headings there given?—First of all, I am very pleased indeed to be given the privilege of coming here and allowed to express what views I have on the subjects that will engage the thoughts of this Commission. The order of reference is a very wide one, and I do not think that in the few remarks I have to make I shall wander outside it. The first matter I would like to bring under notice is one that has engaged the attention of teachers, and, indeed, of education authorities, for quite a number of years, and is of such importance that I would like to refer to it at some length. It deals with some kind of scheme for the promotion of teachers throughout the Dominion. It is nothing new. Several Boards have endeavoured to introduce such a scheme, but, of course, the scheme they have introduced applies to their own district only. The Auckland Education Board has a grading scheme of promotion in regard to its teachers. A number of headings are taken, and under these headings the qualifications of teachers, so far as the subject of the heading is concerned, are estimated in figures. For instance, we assign a certain number of marks to personality, to power of discipline, environment, length of service, and so on, and these marks are added up, and the totals obtained from the addition of these determine the place on the general graded list or on a special graded list that the names of the teachers occupy. When appointments are being made here applications are called in the public Press, and the teacher whose name stands highest on the graded list so far as any special appointment is concerned is the teacher who is appointed. I am afraid that is a little confusing. What I mean to say is this: There is a general graded list and special lists which refer to special appointments and certain grades of schools. For instance, there is a list which refers to the appointment of assistant teachers who would be competent to manage a large infant department. They appear on a list by themselves, and if such an appointment were vacant the teacher who stood highest on that list would get the appointment. I understand the Wanganui Board has a scheme of the kind. Indeed, I believe it was the Wanganui Board who was first in the field so far as this particular scheme is concerned. I do not know if any other Boards have adopted the scheme, but I do think this, and I think a great number of other people think it also: If we can extend the scheme and get a Dominion scheme of promotion adopted in some way or other, it would be a matter of great importance to the whole service. Our service would benefit immensely, for many reasons. I cannot help feeling that there is a great deal of unrest amongst teachers, both here and elsewhere, so far as promotion is concerned. There always will be unrest, of course; we shall never be able to remove it altogether; but we ought to do anything we can to reduce it to a minimum. I feel that if we had a scheme of this kind the various districts would be able to discriminate between the claims of those applying within their own borders and those who applied from outside. That is an important matter. Teachers would have a much better chance of moving from one district to another, and in one way and another the service would be better satisfied. I feel strongly that if we are to get the best work out of our teachers we must make them satisfied. If they are discontented or dissatisfied, either with their present positions or with their prospects, then I hold we are not getting the best out of them, and so it is for this reason as much as any other that I hope this Commission will take into consideration the desirability of endeavouring to formulate, or to take evidence, on some scheme of Dominion or national promotion. If I might be allowed to make a few suggestions as to the details such a scheme might take, I would say this: First of all we want to get an expression of opinion from Inspectors and teachers as to the details of a grading scheme. Some common scheme of grading or promotion might be prepared by a Dominion committee of

Inspectors and teachers. Each education district might be represented by an Inspector, and each Island might be represented by, say, five teachers. If that committee were to meet it could lay down rules and formulate principles for a grading scheme. Having done that the next thing would be, I think, to set up a grading board. The Dominion committee would then have done its work. The grading board might consist of either an Inspector from each district with the Inspector-General of Schools, or it might consist of, say, three Inspectors from each Island, with the Inspector-General of Schools. If it consisted of the three Inspectors then I think the Education Department might be asked to make the selection of the officers required. I do not think I would include teachers on the grading board. I think I would leave them out in my proposal. Now, that grading board would meet once every year in Wellington. Then the several districts in New Zealand might be asked to grade their teachers within their borders. The Education Boards could undertake the grading of teachers within their districts. These graded lists, which would be made out in terms of the recommendations of the Dominion committee, would then be forwarded to the grading board. The grading board would then proceed to arrange in order of merit from these graded lists the teachers whose names appeared thereon. The grading board would also have power to alter or amend the grading of any teacher, and the altered grading would remain in force until the next meeting of the grading board—in other words, for a year. On matters having reference to the general graded lists of teachers, the decision of the grading board would be final. Finally, I would recommend that a copy of these general graded lists should be sent to each education district in New Zealand. You might say to me, How is that a system of Dominion promotion? I do not think it is at all, but I do not know that we can at this stage hope to get any complete system of Dominion promotion. I do not think we can unless our Boards were done away with and the whole education of New Zealand centralized. What we could do would be this: We could get these graded lists, and each Board would then be able to compare the teachers in its own district with the teachers in other districts, and would be able to make the appointments accordingly. I am just as well aware as anybody of the great difficulty there will be in preparing the graded lists. The standard differs very much from district to district. An Inspector in one district might take a very lenient view of what is required of a teacher, and an Inspector in another district a much more exacting view; and so in some districts the marks might be much more liberally given than in others. I know that is a very serious difficulty, but I do not think it is a difficulty that cannot to a very great extent be overcome, and I do think it could be overcome in some such way as I suggest. The next matter I would like to draw attention to is the awarding of scholarships. That has already been dealt with by the Inspector-General of Schools this morning. I may say that what the Inspector-General said this morning was said by myself nearly two years ago here. Of course, I do not for one moment mean to suggest that I was the first person who thought about it. The great point is to get the matter brought forward and discussed. I feel strongly that something of the kind should be done—that the scholarships should take the form of boarding-allowances to country children who have to live away from home. I do not know whether anything was said this morning as to whether the Inspector-General would make any distinction between the holders of Senior Scholarships and the holders of Junior Scholarships. I would be inclined to make such a distinction, and to do away with the scholarship allowance so far as Junior Scholarships, Board of Education Scholarships, and National Scholarships are concerned, and allow the Senior Scholarship holders either to receive the amount they at present receive, or something like it. All these National, Education Board, and Junior Scholarship holders, I think, should receive a free place, plus a boarding-allowance if they have to live away from home; but any Senior Scholarship holder, I think, should receive something in addition to that—say, £8 or £10 in addition to the boarding-allowance. The reason I think the Senior Scholarship holders should receive this is that parents have to make a somewhat greater sacrifice in allowing a Senior Scholarship holder to attend school than in the case of a Junior Scholarship holder, especially if these parents are living in the country. If a boy sixteen years of age is living with his parents at home he can be of considerable use to his parents after school hours or before school hours. If, of course, he is living away from home the parent is deprived of his boy's or girl's services altogether, and these services are more useful after the boy or girl reaches the age of sixteen or seventeen than they are at the age of twelve or fourteen. Are we to give this allowance, if we decide to do this, to everybody who has qualified for a senior or junior free place? Not quite to everybody. To all those, as the Inspector-General said to-day, who reach a certain standard of education, and I think that standard of education might very well be that which is implied by ability to pass the Junior National Scholarship Examination. All the pupils who are able to pass that examination, I think, should receive free tuition, plus a boarding-allowance, if needed.

3. What qualifications would you say—60 per cent.?—I would take the same qualifications as the Department has laid down—I think, 50 per cent. of the total marks. I next wish to refer to the staffing of schools. A great deal has been done by the Inspector-General of Schools in the matter of giving a more liberal staffing than we have had previously, but notwithstanding the fact that our schools are staffed according to the regulations, some of them, I consider, are still understaffed; because, although it is quite true that if we were to take the total number of teachers and the total number of children in our district and do a division sum, we shall find that no one teacher has to teach a large number of children—I forget exactly how it works out—yet we find in some of our large schools as many as sixty or seventy, or even more, children in some classes. I need hardly say that is far too many children for a teacher to do justice to, and although I may be told that the teachers get assistance in the form of pupil-teachers from time to time, yet, after all, of what real assistance can a pupil-teacher be? You cannot break up a great class like that, and give half or even a portion to the pupil-teacher. As a matter of fact, this is sometimes done: the brightest pupils are given to the pupil-teacher for instruction in certain subjects, leaving the

duller pupils, the greater portion of the class, to the assistant teacher. I do not think that is fair to the pupils, and so we want a more liberal staffing in our schools. I know there is a great deal of difficulty in this matter. A great difficulty arises from the supply of teachers with which we have to be satisfied. I think I am right in saying that all districts are experiencing a considerable amount of difficulty in filling up positions in their schools—positions in sole charge of schools and positions of assistants in schools where there is a staff. I cannot help feeling that the cause of this short supply of teachers is partly the length of service involved in the preparation for the work of teaching. A boy passes the Sixth Standard at the age of fourteen. He goes to the secondary school, and is there four years before he matriculates, leaving at eighteen years. He then spends two years in a primary school as a probationer, which brings him to the age of twenty. He has then two more years in a training college. That is to say, he is unable to earn more than a bare living before he reaches the age of twenty-two years. I think that is one reason. Then, I think another reason is that we do not pay enough; our salaries are not sufficiently high. You remember quite well that some years ago a Commission sat to inquire into the salaries paid to teachers in New Zealand, and compare them with the salaries elsewhere. As a result of that Commission the salaries paid to our teachers were considerably increased, and we were all very glad that it was so. But, after all, whether the Commission had sat or not, the salaries of teachers would have had to be increased. I do not think we could have obtained a sufficient supply of teachers to man our schools had we gone on paying our teachers what we did before. I think that is one of the things that simply would have been forced upon us whether we wished it or not, partly owing to the increased cost of living and partly owing to the reduced purchasing-power of money. The cost of living has been increasing since then, and wages have been going up in all employments, and so I feel we are not paying our teachers and assistants enough. And the third reason is that I do not think we have in our service a sufficient number of prizes. Indeed, I would go further and say I do not think we have any prizes at all in our service. I do not wish to introduce personal matters in speaking here, but I consider that the head of the whole service in New Zealand—the Inspector-General of Schools—is grossly underpaid, and that our head teachers are underpaid. A head teacher, if he be successful and able to get into one of the larger schools, gets £400 a year, plus a house allowance of £50, but he has to be six years in the highest grade before he can get that. That means to say that he cannot possibly look forward under any circumstances to getting more money than £450 a year, and there are, comparatively speaking, only a few such positions in New Zealand. You know what an incentive it is to work if people think they have a chance of doing well in the future. You may say there are a great many people in other kinds of work who are not earning anything like that. That is quite true, but they have always a chance of earning more. A doctor or a lawyer or a member of any of the other professions may not earn as much as that, I know, but each has always a chance of earning a great deal more, and it is just that chance that induces a large number of people to take up work of the kind. These are the reasons, I think, why our supply of teachers has become so short. That leads me to another matter, and it is this: Certain pupil-teachers have been withdrawn or will be withdrawn from certain grades of schools. All pupil-teachers from schools of Grades 5 and 6A will have to be withdrawn by the beginning of next year. Now, the training college receives its supply of students partly from pupil-teachers and partly from probationers who are employed, and partly from those who have had no previous experience as teachers, and are known as B students. There are other students who find their way into the training college, but these are the main sources of supply. Now, doing away with the pupil-teachers in schools of Grades 5 and 6A will mean that, so far as this district is concerned, and I have no doubt so far as other districts are concerned, there will be considerably fewer pupil-teachers available for studentships in the training colleges. The Department has given us no indication of what it means to do to make good that deficiency—that is to say, it has not told us whether it means to increase the supply of probationers—and some of us are beginning to think—perhaps we may not be correct in our surmises—that the Department is looking to the B students as the individuals who will fill the training colleges. Now, a B student is a student who passes the matriculation or higher examination, and obtains admission into a training college, but he has had no previous experience of teaching. If I may be allowed to express my own opinion in this matter, I do hope that the Department is not thinking of reducing the number of probationers. I think all people in this part of the world who think seriously about these matters are of opinion that it is a good thing that the pupil-teacher should gradually disappear from our public schools. Whether the time has arrived, however, for doing away with our pupil-teachers or not I am hardly prepared to say. In Auckland we have a great deal of difficulty in obtaining suitable people to man our sole-charge schools and smaller schools, and, indeed, to act as assistants in country schools. Now, we are asked to find for schools of Grades 5 and 6A a number of assistants by the beginning of next year. We certainly shall be able to find these assistants, but it means we shall have to withdraw from our supply of teachers a number of those who otherwise would have been sent into the country, and for that reason I do not know whether it would not have been wise, so far as Auckland is concerned, to continue these pupil-teachers in schools of Grades 5 and 6A for a year or two longer. The training colleges have to be filled, because we are all crying out for teachers throughout New Zealand, and it is to be hoped that the supply of teachers will come from the increased supply of probationers. There will be no doubt, I think, in the mind of anybody that a training-college student should have some knowledge of teaching, of the practical work of teaching, before he enters the training college. I think all people are agreed about that. He profits far more by the instruction he receives if he is able to consider it in connection with the practical work he himself has been called upon to do or to witness. Now, I may be told that he gets that practical work in the training college, and is asked to do it there, but I cannot help feeling that the conditions are not the same in a

training college as they are in an ordinary public school. The student in the training college is working under what I may call more or less artificial conditions. His classes are small; he is not asked to control a large number of pupils as teachers in the public schools are. He is working constantly under the eye of the class teacher, and hence the necessity for discipline or control is not needed to the same extent as it is if he were working in a public school. So for these reasons I do not think that the kind of experience he gets from that point of view is to be compared with that which he would derive by going through a course of training in a public school, and it is for these reasons that I think the idea of appointing probationers to public schools such an excellent one. The probationer is not asked to do much teaching. He has to give instruction during the first two years, and at the end of that time he is in a condition to profit greatly by the instruction and training he receives in the training college.

4. Do you mean all these schools associated with the training college?—No. Probationers are appointed to schools of various grades for two years, and if they qualify they are admitted to the training college. Here is another matter. The Inspector-General, in his evidence in Wellington, rightly laid a great deal of stress on the teaching of agriculture in our schools; but are we doing sufficient in the matter of preparing our teachers to give this instruction? I am referring now to the training college. I am not at all sure in my own mind whether we should not do a little more in the matter of providing suitable courses for teachers whilst going through the training colleges. I may be told the Boards of Education in various districts should do that, but I think myself this training in agriculture is a matter of such importance that it would be better to some extent to make it compulsory so far as the Training College Regulations are concerned. If it is compulsory, more should be done in the way of making the training practical. What I mean is this: Take our own training college. In this training college students are instructed in agriculture, but there is no plot of ground in connection with the training college sufficiently large to enable the practical work that is needed in agriculture to be profitably carried on. I think that is a matter that should be insisted on. How far the Department is going to insist upon it I do not know. I do know that last year the Department pointed out to the Board that there was no such plot of ground, and that the Board endeavoured to get a plot of ground, but as a matter of fact no plot of ground so far has been secured. I think, moreover, it would be a wise thing to endeavour to make some provision whereby students in the training college could be enabled to attend the Lincoln College or some similar institution. There is no reason why female students in the training colleges should not be granted facilities, if they wish, for taking up a course of domestic science such as may be obtained in the Otago University. If a certain number of scholarships were set apart for deserving students each year, at any rate a few of our students would receive this thorough grounding in practical agriculture, which I consider necessary if we are to do justice to the subject. Another matter is this: Our head teachers are required from year to year to hold a certain number of examinations from period to period. They are required to map out schemes of instruction, and during the course of the year to hold not less than three periodical examinations. Now, the head teacher of a large school has an immense amount of clerical work to do. If he conscientiously carries out the instructions and examines the school it takes him a long time to do it. I do not myself see that there is a great deal to be gained by this constant examination of the children by the head teacher, and so I think it would be a wise thing to do away with one of these periodical examinations. I would not do away with them all, because the public must have some safeguard that the work of the school is being efficiently carried on; but I certainly think that two would be quite enough. I went away this morning just as the Inspector-General was beginning to talk about compulsory attendance, and I followed with a good deal of interest the remarks of the previous witness. We are beginning in Auckland to seriously consider the question of compulsory attendance so far as private schools are concerned. We intend, I hope, to apply the compulsory clauses to the private schools. There is one thing I do not think was brought out this morning, and it is this: A portion of section 151 of the Education Act reads as follows: "Head teachers of private schools may apply to and receive from the Chairman or Secretary of the Board a general certificate of exemption," &c. I think that word "may" should be "must" or "shall," and I will tell you why. You may say to me we are able to get at these schools and insist on their coming in. That is quite true if we know of them; but it is quite possible in a town as large as Auckland for a private school to exist without the education authorities knowing about it. I have lately found out about several small private schools which I really knew nothing about before. Now, I think that if the word "shall" was substituted for "may" the effect would be that every private school would have to register. They would come out into the open, and the Boards of Education would be given a chance to find out whether they were efficiently taught, and whether the attendance was regular. It would be a very simple alteration in the Act. Here is another small matter, but it is of small matters, after all, that our Education Act and regulations are made up. We are paying to our pupil-teachers £25 a year in the first year, leaving out boarding-allowance; for the second year, £35; for the third year, £45; and for the fourth year, £55. The probationers in the first year get £20 and in the second year £25 a year. If a boy matriculates he ranks as a third-year pupil-teacher, and he goes into a public school, and remains there for two years, and at the end of that time he enters the training college. During these two years he gets for the first two years £45, and for the second year £55—that is to say, he gets £100 for the two years. If he becomes a probationer he gets £20 for the first year, and £25 for the second —that is to say, £45 for the two years. The consequence is that applicants invariably choose to become pupil-teachers because they get a great deal more money. Would it not be a simple matter to arrange it in this way? Suppose a probationer has passed his Matriculation Examination, why not give him the salary of a third-year pupil-teacher? I would place him on an equality with a pupil-teacher who has matriculated. If, on the other hand, he has passed the

Junior Civil Service Examination, why not give him the salary of a pupil-teacher of the second year? The pupil-teacher has to do more work of a kind, but I do not know that he has to do more work in the aggregate. The probationer is supposed to do and does actual teaching for three hours a day, but he is not supposed to be idling for the other two hours of the day. He is supposed to be observing or doing preparation-work. There is just one other subject, and I have finished. Something was said this morning about examinations, and I was delighted to hear the Inspector-General express himself as he did. I think Mr. Kirk asked if there were not too many examinations in New Zealand. I have no hesitation in saying that I believe we are an overexamined community. Our children are examined, so to speak, from the cradle to the grave. All the way through the primary schools they are examined, and at the end of the primary-school course they are examined by an Inspector, and get a proficiency certificate. They are examined when they get into the secondary schools. At the end of the year, following each other by a period of only a few days, we have the Junior Civil Service Examination, the Matriculation Examination, and, a year or two ago, the Board Senior Scholarship Examination —that fortunately has been done away with—and the Term Examination. All these examinations come one on top of the other, and some of them are entered for by the same pupils.

5. Have you not exactly the same thing running through your University course—overexamination?—Yes. What is the result of all this? The real objects of education tend to be lost sight of by the pupil, the teacher, and the public; and the tendency is to consider the examination as the end of education. An examination, I need hardly say, is an extremely useful thing. You cannot do without tests of some kind. They are useful to teachers in order to enable them to take stock of what has been done, and to the pupils also; but if they are overapplied, then the drawbacks are very serious. I cannot help feeling that we are being overexamined, and I think it is very likely that in some districts in New Zealand there is too much examining going on so far as the primary schools are concerned. I think I am right in saying the Department has discouraged this overexamination of primary schools. But there is a great temptation to examine. It is very much easier to go into a primary school and set certain questions in arithmetic or composition, and test the pupils in that way, than it is to go into a school and take a class or lesson in arithmetic, and judge of the efficiency of the teaching by the way in which that class deals with the problems and matter put before them. It is in some such way as that that the examination of our public schools should be conducted in the future.

6. *Mr. Pirani.*] In regard to the Auckland Board, can you explain why it is necessary, if you have a promotion scheme with all the teachers classified, to call for applications for vacancies? Does that not block the back-country people who do not see the invitation to apply from getting a chance to do so?—It is done for one reason. I may say we have not tried any other plan, but we feel that if we did not advertise, then we would not know what teachers wished to be appointed to what schools. Suppose the Blur Spur School were vacant, there might be a number of teachers on our books eligible, but we might appoint a man who did not want to go.

7. Would not the fairest system be to start at the top and go down the list until you got a teacher who would go?—I think that is the fairest system, but I feel we would be a long time in filling our appointments. We have a great number to fill. In regard to what you said about out-back teachers, we allow teachers to apply by wire, and we allow a sufficient time to elapse to enable the teachers to be notified by newspaper advertisement of the vacancy.

8. Do you send to the Committees the name of one teacher, or four names, as required by the Act?—One only.

9. *The Chairman.*] Is there no objection on the part of School Committees to the adoption of this scheme?—Quite a number of School Committees have objected, but, on the whole, they are satisfied with what we are doing.

10. The larger proportion are satisfied?—Yes.

11. *Mr. Pirani.*] How do you find the classification work out in actual practice? Do you think you get very nearly the abilities and qualifications of a teacher under the classification scheme?—It has been in operation here for nearly three years, and, so far as I am able to judge, we do. The Inspectors are satisfied, and the Committees are satisfied, and the teachers are absolutely satisfied.

12. What provision have you got in your system for teachers objecting to their classification? How does he know of the classification?—He has a copy of his own marks forwarded to him.

13. What provision is there for objecting?—His letter of objection comes in, and it is considered by the Inspectors and by the Board of Education.

14. Have you any provision for reducing the classification of a teacher if he turns out not to be as efficient as you thought he was?—Not from one period of grading to another.

15. Would you reduce if you found a teacher was not up to the standard you thought?—Undoubtedly. The grading of each teacher is reconsidered every two years, and the name of that teacher would come up again and would be considered. If we had any new light as to his efficiency or want of efficiency, we would give effect to it.

16. In regard to the term examinations by teachers, you think perhaps we could do away with one of these; but is it not to an enormous extent at the discretion of the teacher whether he makes it a set examination in every subject or not?—That is quite true to a very large extent, but he is obliged to make it a set examination, inasmuch as he is asked to assign marks to each pupil.

17. Take, for instance, reading and writing: ought not a teacher to know what the qualifications of most of the pupils are if the work has been done regularly, without having a set examination?—The class teacher might do that, and then it becomes a question as to whether the head teacher should acept the opinion of the class teacher in an important subject of that kind or not.

18. Is it the custom in your district for the head teacher to make individual examinations of every class?—Yes.

19. Do you not think it would be a good idea for the teacher to exercise a certain amount of discretion as to making individual examinations?—I do. I think it might be reduced in that way.

20. Do you think there ought to be a certain amount of discretion with the head teachers to pass the duties on to their assistants?—I certainly do.

21. Has it not been the custom in the past, before the regulation came into force, despite the fact that the Inspector held an annual examination, for the teachers to hold examinations themselves at intervals of their pupils' work?—Yes.

22. So this regulation has really not increased the examinations?—It has increased the clerical work. Previously the examination-results were not taken down in the careful way they are supposed to be recorded now.

23. But suppose the papers are not kept, and the answers are not kept, and the results are not kept, what facilities have you for ascertaining them?—It is part of the duty of an Inspector when he goes to visit a school to inquire into the periodical examinations, and ask to see some of the papers and answers.

24. Do you think it is possible for an Inspector to check all that work?—Certainly not; just as he cannot possibly examine all the pupils in the school. He would call for certain papers for certain classes, and judge that way.

25. Is it the custom in this education district for teachers to give the pupils problem books in arithmetic and the answer books, so that they will simply do the working?—It is not customary here.

26. Do you not think that in the case of the smaller schools, say, of Grade I and Grade II, the Inspector should conduct the examination under the old system as it used to be, instead of leaving it entirely to the teacher, with just a check from the Inspector?—As a point of fact, the Inspectors do that. The Inspector goes into a small school with only a few children, and he practically examines them all. I think the only case where an Inspector should examine all the children in a school is where an extremely inexperienced teacher is in charge. The object would be to show the inexperienced teacher what is expected in the matter of knowledge, and during the progress of the examination to direct the questions in such a way as to demonstrate to the teacher how the subjects may be dealt with in teaching.

27. Regulation 9 says, "With a view to ascertain the individual progress of the pupils, the Inspector, where he considers it desirable, may hold an examination of any class in the school on the work done in the class during the current year or during the preceding twelve months. Such examination will be held by the Inspector after consultation with the head teacher, if circumstances permit, and after consideration of any examinations which have been held during the preceding twelve months by the head teacher or the teacher of the class." Do you think the Inspector has time to go through all that rigmarole before he gets this examination?—I think the regulation simply means that the Inspector has to satisfy himself as to the desirability of holding an independent examination before he does it. If he is satisfied that an independent examination ought to be held, this regulation gives him power to hold it.

28. Do you not think it would be much better to have the teachers classified as capable to make these examinations themselves and the teachers classified whose pupils ought to be subject to examination by the Inspectors?—The Chief Inspector, with the other Inspectors, decides whether a school should be fully examined or not.

29. Beforehand?—Yes, beforehand. There are certain schools about which the Inspector will receive instructions from the Chief Inspector, and these he determines to examine beforehand. These are schools known to be relatively inefficient.

30. The point I want to ask about is whether there ought not to be some better system of dealing with it. The objection to examinations seems to be because of the trouble it gives teachers, but I look at examinations from the point of view of the pupil. Supposing a teacher is not doing his work by the pupils—fortunately there are very few cases, but there have been some—and is shirking in every possible way what he ought to be doing, do you think he ought to remain until the time when the Inspector comes there, when in some cases he will not have more than half a day to ascertain whether that school is efficient? Do you think that is sufficient?—Yes, I do. If you mean that it would be a good thing for the Inspector not to allow a school of that kind to stand over for a year before being tested, I do not know how you are going to manage that. Of course, it would be better to go and test that school earlier in the year rather than wait five or six months, but how is the Inspector going to do it? He has not time

31. Do you not think this would be an improvement: that the Inspectors in conference should classify certain teachers as those who ought to be entrusted with the work of examination, and certain teachers as those who ought not?—They would still have to work until the Inspectors got round to examine them.

32. I mean that you should exempt the schools classified as efficient. And more than that, it is very seldom that an Inspector has more than a day at a small school; and if an Inspector found out that the school was being taught inefficiently, surely that is the time to start and examine it right through himself?—No, because what would be the object of examining it right through himself if he is satisfied that the teaching is inefficient? That is sufficient. It is then for him to recommend to the Board, and for the Board to make some alteration in the teaching arrangements. There was one question you raised which I might just explain. In one of our regulations our Inspectors are obliged, as a general rule, to pay two visits to a school in the year. I think it is a great pity there is any such regulation. I think it is a pity that the Inspectors have not got the option of leaving out schools from year to year. There are in all education districts a number of efficient schools that might very well be omitted so far as the visits of the Inspectors are concerned. They might be visited every two years. There are splendid schools doing really good

work, which might very well be left alone for a year or two. The only objection is the difficulty that would be experienced in grading teachers on the staffs of these schools. But we cannot omit these schools, on account of Regulation 1. I have no doubt all the Boards are anxious to carry out the regulations, and feel they should provide for two visits, but that means that in hurrying from one school to another an Inspector cannot spend sufficient time in certain schools where their presence is required.

33. Then you think that Regulation 1 might be modified to make visits twice a year optional?—Yes.

34. In regard to private schools, do you think it would be possible in the present state of public opinion to compel by penalty private schools to subject themselves for examination?—I would use the word "inspection." An Inspector should go there and inquire into the efficiency of the school.

35. Do you think that the inspection should cover, as well as the efficiency of the teaching, the buildings and appliances?—Undoubtedly. I do not think you can have efficient teaching unless you have proper appliances. The State is prepared to give efficient instruction to its young people. If a private individual comes in and says, "I will provide this instruction," then he ought to do it as efficiently as the State. We ought to insist on that.

36. Do you think the difficulty in getting a supply of women for teacherships is as great as getting a supply of men?—No; on the whole, we have greater difficulty in getting men.

37. Do you get sufficient applications from girls for the vacancies generally?—Yes.

38. Do you think it would meet with the objection to the present scale to teachers if the payments to men were raised, if it were not possible to raise the payments to both?—I think if you have to make a choice between the women and the men it would be better to give the men the additional pay; but I would sooner see the addition given to both.

39. But the great want is male applicants?—Yes.

40. *Mr. Wells.*] This is the largest of the educational districts?—Yes.

40A. Have you found it unwieldy?—Yes, in this way: It is very hard for me, as Chief Inspector of Schools, to have a personal knowledge of many of the teachers. It is quite impossible to have a personal knowledge of all; and the knowledge I possess of the teachers here to a very large extent I gleaned from the experience I had when travelling round the country doing the work of an Inspector.

41. Still, with a strong inspectorial staff, I suppose it would not be a serious disadvantage for the Chief Inspector not to know each teacher?—I do not think it would be.

42. As to the unrest you spoke of among the teachers in regard to promotion, is not that unrest mainly evident in the smaller districts?—I think it is, but of course there will always be a certain amount of unrest. There will always be those in the teaching service who think they have not climbed as high up the steps of the ladder as they deserve.

43. If the education districts were larger, do you not think that one of the difficulties of which you speak would disappear?—How are you going to enable a teacher to get from one district into another? We are constantly faced with that trouble.

44. There are at present thirteen education districts. Suppose we had six or four districts, then there would be a number of prizes in each district to which all in that district could look forward. Would that not do away with some of the unrest or a large amount of the unrest?—Yes, I think it would to some extent; but would not the other be a much more efficient remedy? Suppose that the teachers all over the Dominion could feel that they should have a chance to get from one education district to another, and suppose that every teacher could feel that he or she was in the field for all the so-called prizes, the unrest would be much more likely to be eliminated.

45. *The Chairman.*] You mean that if a teacher is a unit in a national system instead of in a sectional one he would have more to look forward to?—Yes.

46. *Mr. Wells.*] Do you not think that the division of the Dominion into larger education districts would be a stepping-stone to that?—Yes, I do. I have thought for a long time that the whole of the education districts ought to be put into the melting-pot and their boundaries redetermined.

47. Can you give us any indication of what you would suggest in regard to improving the syllabus?—Briefly speaking, it might be improved, and would be improved, in my opinion, by altering the arithmetic and making it, as the Inspector-General said this morning, simpler—leaving out some of the things he mentioned, and also dividing it up in such a way as to ease Standards II and V. Too much is expected in these two classes.

48. Would you simplify the geography programme at all?—I would alter it. I would not make any distinction between Course A and Course B.

49. Would you propose to strike out any of the mathematical geography that is now being taught?—I would not. I am not a great believer in striking out so long as you give the teachers the option of utilizing the various suggestions made. The course of geography suggested in the syllabus is not intended to be mandatory.

50. You have mentioned the payment of teachers, and I can quite understand that you do not care to say anything about the payment of the inspectorate. Do you mind telling the Commission whether you do not think the inspectorate should be the prize in the profession—that the pay of the Inspectors should be such as to tempt the very best men in the profession into the inspectorial ranks?—I am dealing with myself more or less personally. I do think so, and for that reason I referred to the case of the Inspector-General of Schools. I think that in his case that applies with far greater force than in the case of an Inspector of Schools employed by a Board of Education.

51. Some little has been said about the shortage of teachers: do you think it would be practicable to import teachers who have been through a training course at Home, and are young enough

to be adaptable to circumstances?—There are great difficulties in the matter of importing teachers. It is a matter that I have thought about a good deal in the last year or so, because of our shortage here. First of all, the shortage of teachers is in no way connected with our larger schools. We can get plenty of teachers to come to our larger schools, or to take up positions within reach of the towns, and if we got young people from Home we would have to send them to the back districts. That is where the teaching service is short of men and women. I feel, first of all, that we do not know much about these young people, and that when they got out here they would be disappointed if they could not get a school near the towns. We constantly have teachers coming out here from Home and applying for employment, and almost without exception they refuse to go away from the towns.

52. Can you tell us whether the Auckland Board has experienced any difficulty in getting grants for buildings in the backblocks: has there been any delay?—I really cannot say.

53. Can you tell us anything in regard to help in growing schools. Do you think it is given soon enough?—No, I do not think it is. I know it is a difficult question, but I think, myself, that if a school is growing, and rising from one grade to another, and if the Inspector is satisfied that the increase will be permanent, then the addition to the staff should be made then and there on his recommendation.

54. Have you thought at all about the centralization of rural schools, and whether it would be practicable to any extent in this district?—Yes, I think it would be practicable. For instance, in the Waikato and other districts, where the roads are good, there is no reason at all why the children should not be brought in to a centre.

55. What is your opinion about the efficiency that would result?—I think the efficiency could not possibly fail to increase, and on the score of economy I believe the country would gain.

56. With regard to examinations, do you think it would be possible to have what is called the accrediting system, by which the pupil is allowed to go on on the certificate of the head teacher without submitting to examination?—Yes, I do.

57. In other words, you would cast upon the headmaster the responsibility of certifying whether an individual pupil was fit to go on?—Yes.

58. That would be a privilege I suppose you would not give to all schools?—That is so, and a privilege that at any time might be withdrawn.

59. I think you said you were prepared to advocate the abolition of the visit with notice?—I did not make any distinction between the two at all, but I would like the clause to be altered in such a way that it would not be necessary for an Inspector to visit a school twice a year.

60. *Mr. Kirk.*] You are doubtless acquainted with the system of arithmetic adopted in the Horace Mann School, in New York?—Only in a general way.

61. Is that the system of teaching arithmetic you would like to see adopted here? Is that what you meant when you spoke of practical-arithmetic teaching?—Not altogether. I think we might alter our arithmetic syllabus in the direction of shortening the syllabus, and grading it better.

62. Do you know whether the school-books for the respective standards now used in Auckland are the same as those used in Otago or Canterbury or Wellington? Are there universal school-books?—No; the books used vary from district to district, but one of these arithmetic-books is used pretty well all over New Zealand.

63. Is it desirable there should be a universal set of books?—I am a strong believer in allowing the teachers to select what they like themselves.

64. There is the objection that has been raised by parents who are living just over the border from one district to another, that if they have to shift their children have straight away to get another set of books. Do you think that objection does not override the general statement you make?—No, because that would not very often happen, and the number of books they would have to replace would not be very many. Still, that is an objection.

65. Can school life be improved by a furtherance of the library principle?—Oh, yes.

66. Would you be in favour of the introduction of general school libraries in connection with the classes?—Of course, a good deal of that has been done in this and other districts. There are libraries not only connected with the schools, but libraries connected with each class-room, which is, of course, the proper thing. That is in answer to the question of libraries connected with a particular school. There is another and wider question of libraries to which a number of schools would have access.

67. There are such libraries in some of your schools?—Yes.

68. Speaking from your experience, can you say if any good results have come from such libraries?—Of course, it is very hard to gauge such results, because they do not declare themselves for years; but we know in many cases that these libraries are largely taken advantage of by the pupils, and we can presume that the books they are reading are of service to them.

69. The children are really making use of the libraries?—Undoubtedly.

70. To a great extent?—To a large extent. I have heard one or two teachers state that now and then the interest in the libraries begins to wane, and what is done in these circumstances is that the teacher will close up the library for a month or two, with the result that the interest comes back again.

71. Is there any matter that has come under your knowledge whereby the administration of the Act by the Education Board in your district may be improved, or where the Act might be administered more sympathetically so far as you, or the schools, or the School Committees are concerned?—I really cannot think of anything further than the matters I have brought forward already.

72. *Mr. Poland.*] Do I understand you to say that, in your opinion, rather much time is given to the teaching of arithmetic by the regulation?—I implied that. Of course, if you make the syllabus difficult, there is a good deal to be taught, and excellent though it is, it means that a good deal of time must be taken up to satisfy the Inspectors at the examinations.

73. Arithmetic is a compulsory subject now for most of the examinations—the Sixth Standard proficiency, the Junior and Senior Civil Service Examinations, and the Matriculation also?—Yes.

74. Do you think that a simplification of the syllabus and a reduction of the time devoted to arithmetic is going to enable pupils to pass examinations without that being a compulsory subject, or would you be in favour of doing away with the compulsory nature of arithmetic?—I would be in favour of simplyfying the syllabus, and not forcing candidates to spend the same amount of time in preparing for it.

75. What would you give that time to?—To English or science.

76. Would you mind giving us your views in regard to rural courses for schools, and the syllabus proposed by the Department?—The rural course for schools applies to the work that is done in district high schools, and it was formulated with the object of giving the work done in these schools a more intimate connection with that which a boy or girl will immediately take up after leaving the school. So far as I know of the course, and I know of its operation in two districts, it has been of very great value to the pupils. I may say that the introduction of this course—not here, because the ground was partly broken before I came, but in the district from which I came—was opposed by teachers, and I understand that in other districts it is opposed by teachers who like the old course, which led up to the Junior Civil Service Examination. I cannot think this rural course is a good course for enabling students to take a high place on the examination list, but I think it is an excellent course for preparing them for the work they take up immediately after leaving school.

77. Do you think, because a child is going to a district high school in the country, that necessarily his future profession will be in connection with agriculture?—No, I do not.

78. Then, the rural course as laid down seems to cause a good deal of the time of a child to be devoted to subjects that will be of no advantage to him at the examination for which he must sit, say, for the Junior or Senior Civil Service or Matriculation, and therefore do you not think the child is handicapped in passing these examinations?—Yes. In some districts, notably the Wanganui District, there are two courses which run side by side in the district high school, one having matriculation and the other rural courses. The Board reserves to itself the right of saying what pupils shall take up the Matriculation course—it will not allow the pupil to decide that—and some modification of that might very well be adopted.

79. Do you think if a child passes the Sixth Standard proficiency in the time specified in the Act that the Board should usurp the right of saying that that child shall proceed at that district high school to qualify for the Matriculation Examination?—I do not. I think some modification of that plan would be excellent.

80. A boy on leaving a primary school with a proficiency certificate and presenting himself at a district high school can, under the proposed course, either take agriculture or chemistry or a commercial course or a rural course?—That depends on the teacher at the high school, and it depends on the course of instruction given at the high school. There are district high schools in this district where there is no rural course given, and a boy could not get it there. I suppose what you want to get at it this: should a child going to a district high school be compelled to take a rural course?

81. What I want to get at is this: do you think that the rural course, which is made compulsory practically in the district high school, debars or handicaps a child who wishes to qualify for either a Junior or Senior Civil Service or Matriculation Examination as compared with a child in a city school?—Undoubtedly I do. I consider a boy going to a high school like the Auckland Grammar School has an infinitely better chance than a boy going to a technical day-school or a district high school. But, after all, what is a district high school for? Is it not for giving the best possible training we can to the greatest possible number of people we can get to profit by it. The training that the pupils get from a rural course is far better for them, whether they are going to become farmers or not, than the training they would receive through preparing for the Junior Civil Service Examination. It is an extremely useful training for anybody, whether they are going on the land or not.

82. You know that the regulation provides that four hours shall be devoted to English and certain other times to other subjects there specified. Do you not think that English, with four hours per week, is receiving its fair proportion?—That may be so; but, after all, was not that a suggested course with which the Department would be satisfied. I do not think it is a mandatory course at all.

83. Was it not adopted by the Auckland Board?—No; I think we modified it. We have only twenty-five hours in the week, and while we would like to give more time to English we cannot do so if we have to teach the other subjects.

84. Do you not think it is more necessary that a child going to a primary or district high school should receive a thorough education in English?—I think more time than four hours per week should be given, but I do not think we can do it. There are other subjects which come under the heading of "English," such as civics and eccnomics.

85. Do you think that one hour per week is sufficient in a high school for arithmetic, one hour for algebra, and one hour for geometry?—It depends on what you are going to do with the subjects. I do not think of these subjects as leading to the examination at all; I look to them as leading to the mental training and development of the child.

86. But, at the present time, is it not a fact that a child who wishes to obtain a position in the Government service must pass an examination?—Yes.

87. And under the proposed rural course, is it not more difficult for a child to do that?—It is more difficult to obtain a high place on the Civil Service list, but not more difficult to pass the examination.

88. You know the appointment of a child to the Civil Service depends on his place on the list?—To some extent.

89. And that if the child is not chosen the first year his name drops out, and he must pass the examination again?—There is another thing we forget. We are told that a great number of these pupils who go to the district high school do so with the object of sitting for the Junior Civil Service or Matriculation Examination. I believe that is quite true. Why do they? I think the reason is that they have never had a proper rural course in the past. It is only of late years this course has been provided. I think when pupils and parents begin to realize the importance of this agricultural course we will get a great number of young people who have not gone to district high schools at all. There is a vast number of people we have not reached in the past.

90. *The Chairman.*] In other words, in the past the Civil Service Examination was the only objective?—Yes.

91. *Mr. Poland.*] You must educate the parents to your views, or they will go for these certificates largely in order to provide their children with positions?—I think it far better to give this course to the larger number of children we are attracting to district high schools than to prepare a few children for examinations.

92. That is so, if your premises are right; but is it a fact that you are attracting children to the high schools now for the sake of the rural course or for the sake of the examination?—For both; but we are attracting a number by means of our rural course which otherwise we would not have got at all. I cannot speak of what has been done here, because we have not adopted this rural course to any extent. It has been in operation in only two schools here; we have not had the equipment before.

93. *Mr. Thomson.*] I would like to ask in what respect you think school instruction can be improved and made of more practical value in equipping pupils for their future careers: whether you think the existing system is perfect or imperfect—if perfect say so, if imperfect, indicate the main imperfections which have appealed to you in the course of your experience, and suggest what remedies?—I think the answer to that question lies in the introduction of a greater amount of practical manual work into our schools.

94. Do you mean by that the system of manual and technical instruction now in force?—Yes; I mean many of our schools here give instruction in woodwork and cookery, but I think that should be extended. I think instruction of that kind should reach the children in the country.

95. Do you believe in nature-study?—Yes, thoroughly.

96. As an expert in education, you can honestly recommend that to all the parents throughout New Zealand?—Undoubtedly.

97. Consequently, you believe that if a child has gone through a course of nature-studies the next course should be a course in agriculture to all children, irrespective of the calling they are going to follow in after life?—Yes. I must explain that, because I cannot answer that question in a single word. I think that training in agriculture, which is a training in elementary scientific method, should be given to boys and girls. That is quite apart from its utility value.

98. You are aware there is a great deal of apathy existing in the country, particularly amongst the farmers, who think that this education should not be imparted, but you would strongly recommend that as a means not only of teaching agriculture, but as a means of teaching science?—Not to teach science, but to try and induce in the individual a scientific aspect of mind.

99. At any rate, that is the only way, in your opinion, by which we can induce a large number to take an interest in what is the primary industry of this country?—Yes.

100. It is a matter of observation that the trend of population, particularly among the young, is from the country to the town, and New Zealand being rather a farm than a manufactory, you would recommend, I take it, that our system of education should be so arranged, if possible, to attract into the country by increasing the inducements to go into the country?—Yes; giving the children a bent for rural life.

107. Do you not think, then, that if we want to encourage children to follow rural or agricultural subjects that it would be better to place them higher on the examination-list for the examination Mr. Poland mentioned, and give more marks for them?—Yes, in general I do think that; but I would do it in a different way. There are certain practical subjects the children take up at the district high school for which they get no direct credit in the examinations. I would attach a certain number of marks to these subjects, and do it that way.

108. You would strongly recommend that?—Yes.

109. I suppose you are aware that 54 per cent. of the boys and 53 per cent. of the girls leave school without passing the Sixth Standard?—I have never quite got at the position.

110. That was the position in 1910. Would you infer from that that the children are kept too long in the lower classes?—I think generally the children are kept too long in the lower classes. Whether that can be helped or not just at present it is difficult to say. You see, in a district like this, where there is a great number of small schools, and little children have to travel long distances to school, it sometimes happens that these children are a longer time in getting through their classes than they would under more comfortable conditions. I think the reply to your question is this: there are great inducements given to young people to begin work. They can earn good wages. Another thing is that the standard of comfort in New Zealand is relatively high, and it becomes indeed a necessity at times for parents to insist on their children going out into the world and earning at an early stage. I think the parent is quite as much to blame as the child.

111. It would be very desirable, would it not, if we could increase the percentage of the boys and girls who pass Standard VI?—Most desirable.

112. Do you think that one fixed minimum of salary is practicable in the absence of any scheme of centralization—I am referring now to the small backblock schools particularly?—I would pay to the backblock-school teacher a higher salary than he now receives.

113. I suppose you have read the remarks of Mr. T. S. Foster, Chief Inspector of Schools in North Canterbury?—Yes, I saw them.

114. You see he holds the opinion that it is impracticable?—Yes, but I do not think so.

115. I asked the question because there is a growing demand that the teachers in the back-block schools should be of superior quality than the present, and the only way to get superior teachers is for these small schools to pay what is, relatively speaking, a higher salary than that received by the teachers in the more centrally situated schools?—I would not advocate that, but I think teachers of aided schools should receive more than they at present receive. It is altogether a question of finance.

116. How do the schoolboys of the day compare with the schoolboys of thirty years ago?—I think, speaking generally, the schoolboy of to-day is better equipped for the work of life—I think, more intelligent.

117. You are aware of the statement of tradespeople that the schoolboy coming out of the primary school is in a very unfit condition: you think that statement unwarranted?—I think it is. The primary school is not supposed to turn out tradespeople.

118. In brief, what is your opinion of the existing syllabus?—Speaking very briefly, I consider the syllabus is a good one, the reason being that it is an elastic syllabus, and allows the teacher a very great deal of latitude; and the Inspector also in his method of conducting tests to gauge the efficiency of the school. I feel sure both teachers and Inspectors would be sorry if the syllabus as it stands at present were interfered with to any great extent. No doubt some slight modifications are necessary.

119. I understand you are opposed to uniform school-books?—Yes.

120. What are your reasons?—For the reason that I think the teacher can teach best what he knows and likes best. I think a teacher can teach from a book he knows and appreciates better than from one he does not. I think also it is a great mistake to do too much thinking for any person, teacher or anybody else. If you prescribe the books for the teacher, he is not required to look into a book for himself and to compare one set of books with another. In other words, it tends to deaden him so far as his knowledge of books and literature is concerned.

121. What has been the result of the Government providing free school-books? Do you find them disused?—No; the result has been that there has been a great deal more reading done in our schools than was ever done before as the result of the introduction of these free school-books.

122. Do you believe in the continuous reader?—I believe in contiuous reading-books being introduced into the schools, but I also believe in the miscellaneous reader.

123. Do you not think that continuous and silent reading is superior to the miscellaneous reading-book?—You are talking about two different things—the reading-book and reading. So far as reading is concerned, silent reading is one method teachers take in order to secure good reading, and it is a very effective method, properly used.

124. Do you prefer the miscellaneous reading-book?—It is very difficult to answer a question of that kind. I would not say I prefer it, but I should be sorry to see the abolition of the miscellaneous reading-book in our schools.

125. You approve of the policy of providing free school-books?—Yes I do, now that the Department has allowed pupils to purchase a certain proportion of their own reading-books.

126. Knowing the feeling of the people in the Auckland District, do you think there would be any great difficulty in establishing continuation schools for instruction in agriculture between the ages of sixteen and eighteen, utilizing the existing building for that purpose?—Yes, I think there would be a considerable amount of difficulty in inducing young people in the country to attend continuation classes.

127. Do you think it premature to make attendance at these continuation classes, confined to the teaching of agriculture, compulsory?—Yes.

128. What do you think is the feeling in the Auckland Education District in regard to the control and administration of education? Do you think the feeling is in favour of a central system or of local control?—I think the general feeling here is in favour of local control.

129. There is no desire to abolish Boards or Committees?—No.

130. *Mr. Davidson.*] Suppose such a list were made as you suggested, and the education districts remain as they are at present, do you think that would help the teachers in very small districts, such as Grey or Westland, to get out?—Yes. What happens now is this: A vacancy occurs, and we call for applications. If we get an applicant from one of these districts we have nothing to guide us at present. Supposing the names of our own teachers and his name appeared on a general list, that would be a guide to us as to the relative efficiency of each.

131. In a large district like this you would always have a large number of teachers to choose from, and the chances are surely that a man in Westland who was eligible would have a very poor chance of competing successfully against a teacher in Auckland?—I do not know. Suppose we had a school of Grade 4 or Grade 5 vacant; well, an outsider has little or no chance at present of getting to such a school, although there may be outsiders who are more efficient than the ones who would apply for the appointment so far as our own teachers are concerned. In districts like Westland or Grey there might be efficient teachers who would like to get out, and they might be more efficient than our own teachers; but we do not know, and have no means of knowing.

132. That is possible?—It is more than that. I am thinking of a case that came under my notice the other day. A gentleman came to see me, and he impressed me as being a really good man, and one whom I would like to see in our service, but he told me he would not come unless we could give him a Grade 4 or Grade 5 school.

133. Westland has an average school-attendance of about 1,000—about as many as you will find in one of the largest schools in Christchurch or Auckland, where you have about 43,000 pupils: do you think it is in the interests of education that there should be such a small education district as Westland is at present?—No, I think it would be better that the two Islands should be divided into a number of districts—say, four districts.

134. Do you think it is possible or advisable that the Dominion should be divided into four education districts the boundaries of which would be coterminous with the present university districts?—I would have more districts than four.

135. Then, to prepare for the satisfactory working of such a scheme as you suggest, you would certainly wish to see some of these small districts amalgamated?—Not to prepare for the working of the scheme. I think the scheme might prepare for the amalgamation.

136. You referred to the staffing of the schools, and pointed out that in some schools a single teacher is now teaching 60 or 70 pupils in one class?—Yes.

137. Have you noticed that in the scale of staffing that schools with an average of 401 receive no addition to the staff until the average attendance is 481?—Yes.

138. Do you think it would be advisable that a new scale of staffing should be introduced to meet the requirements in such cases?—Yes, I think it would be. I certainly think there ought to be another assistant in schools where the average attendance is well over 401, but has not reached 481.

139. Of course, it will be all right when the new scale of staffing comes into operation?—Yes; but there is another question that enters in there. If we are going to put assistants into schools of that grade our smaller schools must necessarily suffer.

140. Is not the number of schools in the unfortunate position of ranging between 450 and 480 in average attendance and getting no increase in staff very small?—Yes, it would not make a great deal of difference.

141. In trying to account for the shortage of qualified teachers, you pointed out the length of service required of a man before he received any fair remuneration for his work, and the poor salary he then received, and so on; but what is your opinion about the difficulties of entering the teaching profession: For instance have you carefully studied the new regulations for the examination and classification of teachers?—Yes.

142. One of the clauses provides that "candidates will be required to produce evidence of having satisfactorily attended approved courses in first aid and ambulance": do you think it is possible for some of the teachers in the backblocks schools to attend satisfactory courses in first aid and ambulance?—The Department last year allowed us the sum of £225 to enable uncertificated teachers to qualify, and they are allowing us the same this year. We mean to use a portion of this money in providing this necessary instruction for the uncertificated teachers.

143. How will you provide for their going to a centre where such a class of instruction is held?—We are not providing for the expense of travel. All people have to make certain sacrifices in order to get on. There is no reason why in the smaller centres the teachers should not arrange with the local doctors for a course of instruction to satisfy the Department. That should not be a difficult matter to arrange. They are having these ambulance courses in quite a large number of centres—Rotorua, Hamilton, Cambridge, and Whangarei, and centres of that kind.

144. In order to qualify for the C certificate it would be necessary for a teacher to give eighty hours in the year to this work, and some of the teachers in the back districts who hold these certificates are particularly anxious to become more highly qualified; but will it be possible for them to do eighty hours' practical work in these science subjects?—Probably not for quite a number of teachers; but what would happen would be this: they would gradually get away from the back districts. Of course, teachers do that as they get on, and when they are nearer to a centre they can raise their certificate.

145. *The Chairman.*] How long does it take to get out of the backblocks?—It depends on the individual and the record he shows.

146. *Mr. Davidson.*] You would not encourage these people to get their C certificate in order to get out, and the getting of the C is made particularly easy in the training colleges, while it is made particularly difficult for the outsider?—I am sorry that on this particular occasion I cannot agree with you. I do not think the obtaining of either C or D is by any means made easy in the training college. It is not the examination that counts, but the course of instruction which leads up to the examination, and in the training college here a great deal of care is taken to see that both in regard to preparation and acquisition of knowledge the teachers acquit themselves creditably, and if they do not do that they will not get either C or D.

147. Some of the Inspectors in the South say that it is utterly impossible for some of the backblocks teachers to attend first aid and ambulance classes?—I think that is quite true.

148. And yet an impossible condition is made here for certain teachers. In your opinion, would it not be better if this science were left until a teacher could get his D or C certificate, and then he could afterwards take science and get a certain certificate for it?—What is the object of this examination? The object is to ensure that the teacher will possess the requisite knowledge for giving instruction in schools, and I do not think any teacher should possess a certificate to give adequate instruction unless he has reasonable knowledge of science.

149. Would you not do what they do in South Australia—issue a provisional certificate?—A teacher can get a partial D.

150. Have you thought it wise to put insuperable difficulties in the way of backblocks teachers?—I should say, in answer to that general question, is it unwise; but I do not think we have put insuperable difficulties in the way of them. It is not possible to legislate for special cases. The great bulk of our backblocks teachers in Auckland will be able to reach a centre where they can get instruction in ambulance-work.

151. Do you think it possible, with the opportunity offering to the individual students in these training colleges in New Zealand, for the students to get sufficient practice in learning to control a class?—I do not know how to answer that question. I think, so far as the control of the class is concerned, that the teacher would probably do better if put in control of a large class and allowed to work out his own salvation, but whether that teacher would eventually be a better disciplinarian I am not prepared to say.

152. Do you think, if the training-college authorities had the privilege of sending their students to observe the very best teachers in and around the city to work and probably take part in the work of teaching, that would be a help in the direction of giving them the power to control?—I undoubtedly do, and in point of fact it is being done here. We send a few of our best students to certain schools.

153. In regard to free books, we have been told that in numbers of schools in many education districts the shelves and cupboards are filled with books that are not being used by the children. It has been stated that probably 85 per cent. are purchasing their own books, while the free books are lying in the cupboards: have you found that to be the case?—One of our Inspectors drew my attention to that last year, but he saw it in only a few cases in the smaller schools, and we made special comment on it in our Inspectors' annual report. I may say that I do not think that obtains to any appreciable extent in the Auckland District.

154. Do you know of the experiment that has been tried in Berkley and Concord, United States of America, where promotions are made biennially instead of annually?—I do not know of them.

155. Do you think it is a matter worth consideration—that is to say, have two sections in each class, in order that the brightest pupils in the class may not be retarded unnecessarily in their progress?—Why should they be retarded? The teacher now has perfect liberty to classify the children as he likes.

156. As an experienced Inspector, do you not think the general practice is to keep a child one year in a class?—Undoubtedly, but there is no reason why it should be the general practice.

157. On the question of reading, the Victorian and South Australian Education Departments have recently issued a new course in the subject of reading in which special stress is laid upon phonics or voice-production: do you think it would be a wise thing to take that into consideration in preparing our new syllabus?—I do undoubtedly, not so much from the reading point of view, because, after all, very few people are ever called upon to read aloud, but from the point of view of speaking.

158. *Mr. Hogben.*] You know that it was in the amending Act of 1908 that the new scheme of staffing our schools was introduced?—Yes.

159. And you know that the basis of the new staffing when it is complete is a head teacher and one assistant to every fifty pupils?—Yes.

160. And the old basis was one teacher and one pupil-teacher to every ninety pupils?—Yes.

161. With regard to the new teachers' regulations, you think that science-teaching is necessary for a teacher who asks for a full certificate?—Yes.

162. And you think it would be a sham science-teaching if it had not work attached to it?—Undoubtedly.

163. You are aware that the Boards are provided altogether now with £4,000 for the training of teachers—£3,000 is put down for subjects of manual and technical instruction, and £1,000 was the special vote last year?—Yes.

164. You are also aware that these subjects are required in the certificates of practical work, and two subjects of manual and technical instruction?—Yes.

165. So that the whole of the £4,000 can be used by the different Boards for the purpose of training teachers?—Yes.

166. Have you thought that that would give you in Auckland something like £800 or £900 a year for training uncertificated teachers in future in these subjects?—No, I did not think of it in that way.

167. If you had that money, would it not be enough to pay for something like six or eight weeks at £1 per week per teacher, and to give them full instruction for the eight weeks in the scientific work they have to do?—Yes, it would be enough, at any rate, to supply the instruction, and to pay the expenses of going backwards and forwards to some centre. Their salaries would still go on.

168. I am contemplating the teachers giving up something, perhaps their Christmas holidays, for one year. You are aware that that is done in other parts of the world?—Yes.

169. If they gave up their Christmas holidays once in order to get the certificate required, and worked five hours a day for eight weeks, they would get a good start in elementary science?—That is a long time to ask them to work.

170. Do you think they would object to do that if they really wanted their certificates?—No. We do it here now in a somewhat similar way. We ask them to give up a week's holiday, and we give them an additional two weeks' work.

171. You are aware that at the Ontario Agricultural College and at the Hawkesbury College they do that?—Yes. They not only do that, but there is a tremendous amount of competition amongst the teachers to get into the Hawkesbury College.

172. Do you think that a good many of our teachers would be willing to take such a course if it is provided?—Yes, I think a good number of them would. Some modified form of that could be adopted.

173. So if the Department and Boards would agree to the establishing and recognition of classes it would be possible, with very little more expense than now, to provide such instruction?—Yes.

174. There is nothing in the regulations against it now?—Nothing that I know of.

175. You are aware that some districts are paying boarding-allowances to teachers for these classes?—I was not aware of it. I knew they were paying travelling-allowance.

176. Supposing you were to have a promotion scheme for the whole Dominion, it would be absolutely essential that there should be a conference between the Inspectors of the several districts?—Yes.

177. Supposing there was such a conference, and a scale of marks were drawn up, would it still be necessary to keep the scale that we have now, which depends on the marking for teachers' certificates by the Inspectors at present?—I do not think it would.

178. You think one would be enough?—Yes.

179. Do you think that the one that is carried out now is really a sufficient index of the standing of the teachers?—I do not.

180. Would you state on what grounds you think it is insufficient?—On account of the different standards men in different districts set up. If you take a small district: the Inspector is asked to classify his teachers and to assign efficiency marks, and he has no standard to guide him. He may not have any really strong efficient school in his district. Besides that, different people take different views of the qualifications of teachers. I am aware that the Department does not lower the classification of any teacher.

AUCKLAND, 5TH JUNE, 1912.

EDWARD KER MULGAN further examined.

181. *The Chairman.*] I understand that you wish to enlarge your answer to the question of yesterday in regard to the use of the grant for the training of teachers?—Our position is this: We are getting up classes for the instruction of uncertificated teachers. All the teachers who are receiving this instruction live at a distance. It would require at least £5 per head to provide instruction for those teachers between now and the end of the year. That means that we could provide with the grant for about forty-five teachers—to be on the safe side, say, forty. I have had applications with respect to these classes from 120 teachers. If we provided for all those we should spend £600 out of the £900 on tuition fees alone. The grant would not bring the teachers to the centre, pay for their instruction, and provide for their board. Besides, is it quite fair to say that the Board has at its disposal £900 for the training of uncertificated teachers? The £900 is made up of a special grant of £225 and that the balance is £650. That £650 is used for giving instruction in cookery, woodwork, dressmaking, and other subjects of that kind. It seems to me that it would be unfair to deprive teachers of instruction in those subjects. So it is hardly fair to say that the Board has that amount at its disposal for the training of uncertificated teachers.

182. *Mr. Hogben.*] Is not science included among the subjects of instruction for which you can use the £600?—Yes.

183. And having used this so long for training teachers in woodwork and cookery, would it not be fair for a year or two to use a rather larger proportion for training in science?—We might use some for that, but I do not think it would be right to use a great proportion, because there are so many young teachers to come in.

184. You must get them in the training college, which is separately provided for?—Yes. Notwithstanding that, there are a great number of teachers who require this training to-day.

185. But are the whole 120 ready to get their certificates except as regards science? Could you not devote it, say, to forty who are ready to take science to complete their certificates?—I do not think that is quite the question. We could do that, but it is a question whether we should deprive the other eighty pupils of the opportunity of receiving benefit from the grant.

186. But they will get it in their turn, of course. Is it not true that you have been training teachers in woodwork and cookery for a long time, and that many of the teachers you have been training are not actually teaching cookery and woodwork?—A great number of them are not.

187. Then, would it not be fair to divert a good portion of the grant for the teaching of the present uncertificated teachers, or some of them, in science which they will use in their teaching?—I think it would be fair to devote some of it to that purpose, but not an appreciable portion, because we have young teachers continually coming on who require this training.

188. Suppose you took £400 of it, and estimate the cost of training teachers at something like £10 each. Thus you would train forty teachers who have completed their certificates except as regards science?—We will have to give them training in other things. I think it would not be right to the service to take any large portion, because this district differs from others in that it is a very large district, and we have a great number of teachers coming on who require to be trained, and there are other subjects in which we give training—dressmaking, drawing, brushwork, and so on—in which it is necessary that the young teacher should have training.

189. You said that one of the reasons why you do not get so many candidates for teacherships is the length of training they have to undergo before they can earn a fair income. How would you hold out inducements to them? Would you pay higher rates where they are training-college students than they get now?—No. I think the prospective benefit is always a greater attraction than the immediate benefit. They consider that the prospect of earning a good income at the age of twenty-five or twenty-six is more satisfactory than a moderately good income while they are being trained.

190. Then if you give them enough to keep them while they are being trained the inducement would be sufficient if the ultimate salary were higher?—Yes. It is the length of training taken in connection with what it leads to.

191. You think that the length of training would be rather a good thing for the teacher if he is to get a good salary afterwards?—Yes.

192. As long as you could maintain the teacher, so that any boy or girl with ability from any section of the community could come in, you would not cut down the secondary course to two years?—Certainly not.

193. What do you think of the requirements for entering the training college, and also the leaving certificates, which mean three years of secondary schools?—The requirement under the new regulations is also a leaving certificate instead of matriculation.

194. What do you think of that?—That would mean lowering the qualifications before entering.

195. At the present time they generally get only two years before becoming probationers?—Yes.

196. So that by giving three years you would lengthen by one year?—I would rather lessen it by one year.

197. Lessen it from the ideal, but increase it on the present practice?—Yes.

198. That is to say, you would have as an intermediate step to increase it from two to three years, instead of from three to four?—Yes.

199. You would not cut out the B students from entering the training college?—I would not prevent them from entering.

200. You would not prevent the best of the teachers in the country schools from entering the training college after qualifying for matriculation?—No; but I understand that now the training colleges and the authorities get as many A students as possible to enter. Here and in other colleges there is only a certain percentage of B students. I would not prevent them from attending, but I would like always to see the proportion of B students smaller than that of the A students.

201. *The Chairman.*] Is there any bar to the admission of B students at present?—The college will only accommodate a certain number of students—say, 100. Suppose there are only ninety A students coming forward, they are considered first. We may fill up the ten vacancies with B students.

202. *Mr. Hogben.*] The regulation reads that the number shall not be increased by the admission of students other than A students above 100?—Yes.

203. With regard to agricultural instruction in the training colleges, is it not a fact that under the regulation every training college must give agricultural instruction?—Yes.

204. And such teaching will not be efficient unless you have enough ground to work the course practically?—It would not.

205. Has not the Department on two occasions in its reports recommended that there should be sufficient ground attached to each school?—I know of one occasion, but I do not remember the second.

206. Is not the difficulty that of finding the ground?—I think it is rather more than that. My interpretation of Regulation 25, clause 2, is that if the student is going to the University College, and taking up such subjects as zoology and geology, he may be exempt from agriculture.

207. Is there not a difficulty in finding a place on the time-table?—Yes; but my opinion is that agriculture should be a compulsory subject in the training college for every student, male or female. A course of geology and zoology would not teach gardening.

208. Do you think that, in spite of the time-table, some other subject should give way?—I do.

209. You think that a University course in science would be an advantage?—Certainly, provided the student is able to profit by the instruction given at the University.

210. That is presuming that the University should not admit any one who was not able to profit by it?—I think it is provided for in the Training College Regulations.

211. *The Chairman.*] You would prefer that that reservation should be withdrawn—that the course should be compulsory while the student is at a training college in preference to the University course?—I would not propose that it be withdrawn, but it should be modified in the direction of insisting on practical instruction being given to every student at the training college.

212. *Mr. Hogben.*] Then, you would say "except in the case of agriculture"?—Something of that kind.

213. Will you turn to the Regulations for the Inspection and Examination of Schools, clause 8, page 5. Does not that mean that in a small school the Inspector is practically examining the whole school in order to ascertain the character of the teacher?—In most cases it does.

214. That the number of pupils in each class in a small school is really small, and he would practically take the whole class?—Yes.

215. Does it not mean that his object is to find out the character of the teacher? Is not that more important than classification?—Yes.

216. Do you not think that a teacher who can really teach is also qualified to say which class his pupils ought to be in?—Yes; but is not that begging the question? Of course, a teacher who can really teach is able to do so. I think the question asked me applied to teachers who are not able to teach.

217. The same thing which taxes their power to classify taxes their power to teach?—Yes.

218. *Mr. Pirani.*] Will you turn to clause 5 in the same regulation, which relates to the periodical examination? Do you read that as meaning that every one of the periodical examinations must be a complete examination of all the pupils in all subjects?—I did read it so, and I think the teachers interpret it in that way, and have acted upon it in this district.

219. Do the records of the last of the periodical examinations for the year include the marks?—They do.

220. But does the regulation require that?—You have to satisfy the examining authorities. How are you to record the result of the examination without something of the kind?

221. You think you could not do it by an added statement?—At any rate, we do not do it, and it is not done in other districts.

222. Would you make any other alteration than reducing the number of periodical examinations in schools?—At present I would say No. I have not thought of making any other alterations.

223. You would still let it be understood that the marks were required in each of the examinations?—Yes.

224. You said you believe in the accrediting system: do I understand that you would apply that to the scholarships that would be given to those who were just leaving the primary schools with certificates, and who wish to go to the secondary schools?—Yes. Indeed, I look forward to a time when we could apply it to the scholarship-holders, but I would not do that now.

225. You would give it for the present on the Junior National Scholarship?—Yes.

226. *Mr. Thomson.*] Would it greatly help the uncertificated teachers if they were allowed to take their examinations in sections?—I think so.

227. Would you advise that they be permitted to do so?—Not more so than is provided in the old regulations.

228. *Mr. Pirani.*] Do you think it would be advisable that all Native schools should be under the Education Board as a matter of common practice—that there should be no exceptions to the primary schools?—I have not had much experience with Native schools, but from what I have seen, I think it would be a good thing if they were put under the Education Board. That opinion might be modified if I knew more about them.

229. Do you think it is fair that the students in training colleges should be debarred from doing relieving work in their vacations?—I would rather put it in a different way, and say that I do not think they should be required to do relieving work. I do not think they should do relieving work.

230. They are not working at the training colleges from November until March: do you not think that in that interval, as is the custom in America, they might be permitted to do relieving work if they want to supplement their income?—On the whole, I think not. I think the student requires that time for preparation for the work for the coming year. The work of the year, as far as the student in a training college is concerned, should be strenuous work, and he requires the interval for preparation.

231. Do they use that time in preparation?—There are a great many ways of preparation. They might prepare by going down the harbour on excursions, or by chopping wood. I consider that a valuable preparation for a year of strenuous indoor work.

232. Do you think they should be permitted to take private work during that time for pay, although not permitted to take public work in their occupation? For instance, we have pupils in the training colleges who do private teaching, and there is no objection to that. Do you think, then, that there should be any objection to their taking public work in schools?—I do not know that there is no objection to it. If it came to the knowledge of the Board, I presume that the Board would inquire as to how much private work is being taken, and if it were too much they would object to it being done.

233. Do the Board take any steps to inquire?—I do not think they do.

234. Do you not think it would be fair that the student who went to the training college—say, a B student—should be allowed to count his time at the training college towards the increment of his salary? For instance, pupil-teachers in our district point out that if they do not go to the training college for a few years their salary will go up by £10, whereas if they do go to the training college they go back to teaching at the same salary as before—at £90. Would it be a fair thing to say that those two years should count towards the increment of the salary in the same way as if they were working at a school?—The salary is attached to the position. When the pupil comes out of the training college he takes up his position with a minimum salary, and that seems to me fair.

235. Would it not be fairer to let him start afresh where he would have been if he had not gone to the training college?—Some of the students from the training college begin at £90, some at £120, and some at £150.

236. Would it not be fairer to give the student at the training college £100, which would be equal to the increment they would be earning?—I would much rather see the system altered in another way, making the minimum salary £100.

237. Is it not fair to pay the student who has been through the training college more than he would have got if he had not attended the college?—That does seem an anomaly, but there are several other anomalies that we have to put up with.

238. If the training college is worth anything to the student it is worth something to the pupils?—The training is worth a great deal to the student, not immediately after he comes out of the college, but five or six or ten years later. It enables him to rise in the profession. In this district a pupil-teacher must matriculate before he or she is eligible to enter the training college. If he matriculates he goes to the training college at £60 a year. If he does not matriculate we may be obliged to employ him, and may find him a position at, say, £100 a year. This seems to be putting a premium on idleness.

239. Could not that anomaly be removed if you allowed the period of training to count to the efficient teacher the same as to the inefficient teacher who does not go to the college?—I do not think it should be done that way.

240. *The Chairman.*] Is the time ripe when we should say that a teacher is not efficient because he has not been to a training college?—No.

241. *Mr. Pirani.*] He is inefficient in that he cannot pass matriculation. That is our case in many instances. He is inefficient, but we may have to employ him to man our schools. He does not possess the ability to pass the examination.

242. *Mr. Kirk.*] Does it not resolve itself into the answer you have already given—that prospective advantage is better than immediate advantage?—That is so.

243. *The Chairman.*] Supposing that a reform were instituted which gave the controlling body in education the general control of all phases of education—primary, secondary, and technical—would it not be some advantage to the teaching profession if all positions were open to primary-school teachers if they were qualified, or qualified themselves by study?—Of course it would.

244. Similarly, would it be any advantage from the Inspector's point of view?—I think those positions are open to all teachers now. They certainly should be open.

245. And all positions in the inspectorate of the Dominion be open to all public-school teachers?—I think so.

246. Would it be any advantage if the position of Inspector were made to apply to the whole Dominion, not merely to the divisions of it?—Yes, that would tend to the benefit of education, provided, of course, that the salaries attached to the position were not lowered. I understand that in certain districts the salaries attached to inspectorships are much lower than in other districts. There should be a levelling up according to position and responsibility and length of service.

ROBERT CAMPBELL examined on oath. (No. 3.)

1. *The Chairman.*] What are your educational qualifications and position?—I hold a C1 certificate, and am first assistant in the Mount Albert School. I come forward as the mouthpiece of the Auckland District Educational Institute, of which I am president.

2. Will you tell us what the conclusions of the Institute are with regard to the questions raised in our order of reference?—I submit the recommendations of the Institute, and on all points where necessary I will distinguish between my individual opinions and those of the Institute. The resolutions of the Institute are: "Recommendations of the Auckland District Institute. The Institute recommends—(1.) That where there is a group of small country schools connected by passable roads, several of those schools should be closed, and the scholars conveyed daily to one central school. (2A.) That the Inspectors of the Dominion should be under the Central Department with respect to the interpretation of the regulations and of the syllabus; and that a Dominion scale of salaries, which should be such as to attract the best teachers in the profession, should be adopted for Inspectors. (2B.) A more speedy compliance with the Board's recommendations regarding the erection of new schools or the enlargement of old ones, especially in districts where the increase is rapid and likely to be permanent. (2C.) That the Regulations for the Examination of Teachers, issued by Order in Council on the 16th February, 1912, should be modified so as not to press so heavily on those candidates who wish to be examined in scientific subjects. According to those regulations, each candidate in Class C must produce a certificate showing that he has gone through a sufficient course of practical work occupying at least eighty hours in each subject. The Institute considers that many country teachers will, in the face of that regulation, find it impossible to obtain a C certificate. (3.) That all appointments of teachers be made by Education Boards on the advice of their Inspectors, who shall have previously classified all teachers on a graded list, similar to that at present in use in the Auckland District. (4.) The abandonment of the present system of payment by capitation for manual instruction. (5.) That the cost of education should be provided for by general taxation, and that no portion should be raised by local rates. (6.) That the instruction in agriculture should not be of a technical nature, but should be considered simply as one valuable means of developing the mind of the child by trained observation of the processes of nature. (7A.) That the course of instruction in arithmetic should be curtailed, more evenly distributed among the standards, and be of a more practical nature. (7B.) That the study of mathematical geography demands more abstract reasoning than can be expected from young children, and might very well be omitted from the syllabus. (8.) That all Junior National and Education Board Junior Scholarships should be abolished, and the money so saved should be spent in paying the lodging-expenses of those children who are highest on the list of the Junior Free Place Examination, and who require to live away from home in order to attend a secondary school."

3. *Mr. Pirani.*] Would you mind stating how you would have the regulations for the employment of teachers altered?—One point that is mentioned here is that in the new regulations it appears that those country teachers who are at a considerable distance must produce a certificate showing that they have devoted the eighty hours to the study of practical work in a particular science. I do not see how that difficulty can be readily overcome. I grant that the teacher who undertakes to teach a science must not work up his science from books only, that he ought to have a first-hand knowledge of the practical work if possible. The effect of these regulations appears to be that a considerable number of these teachers in the country districts will be debarred from obtaining the C certificate, which, of course, they are very anxious to obtain.

4. What do you think of the suggestion that the examination should be taken in annual periods instead of being taken at one time?—I do not agree that it would be fair to the country teacher who has to devote one year's hard work to his profession to take from his annual holiday four weeks, and of those four weeks to have five days per week devoted to the study of practical work in one science.

5. You think it is just as desirable that a teacher in full practice should have his recess as that the student at the training college should do so?—It is quite as necessary to him, if not more so.

6. Do you think that the obtaining of a certificate might fairly be made easier by allowing the teacher to take his certificate in three sections?—I do, very decidedly. I see no objection to its being taken in a number of sections.

7. In regard to the old E certificate that was abolished, do you not think it would be of advantage for those teachers who have a difficulty in reaching the D standard at first to have an opportunity of getting such a certificate as the old E to prevent deduction of salary because they have not the certificate? Would you advocate a partial reinstatement of the old E certificate?—I am afraid that that question has not been considered by the Institute.

8. Coming to the appointment of teachers: does the Institute mean that the matter of the appointment of a teacher should not be brought before the School Committee at all?—The Institute is very definitely of opinion—with more unanimity of opinion on this point than any other point you might possibly question me on—that the appointment of teachers should remain solely in the hands of the Education Board. We have had considerable experience in this way. It is a point which touches us very nearly; we have had many years' experience of appointments resting under the dual control of the Boards and the Committees, and we are of opinion that nothing could be more unsatisfactory as a system. The present Auckland Board about three years ago instituted the grading scheme, which has since been working to the entire satisfaction of the teachers. Of course, a number of teachers happen to be discontented with their places on the grading list, but as a scheme it has the almost unanimous approval of the teachers throughout the Auckland Province. Under that system the Board makes a selection from the names of the applicants. That selection is made nominally by the Board, but practically by the Inspectors sitting as a Board, and classifying once in two years all the teachers in the employment of the Board. When a position becomes vacant the Inspectors make their recommendation of one name to the Board, and the Board then practically automatically sends on that name to the Committee.

9. Under the present system the Board gives the Committees an opportunity of objecting to a proposed appointment: would you abolish that?—No, I would not.

10. That is not quite clear in No. 3 resolution. You think it would be fair to retain to the Committee the right of objecting to an appointment then under the classified list?—I do.

11. With regard to No. 4, how would you pay for manual instruction in schools? Do you object to payment by capitation?—One plan suggested by the teachers was that payment might be made in very much the same way as payment is made for such things as lead pencils and slate pencils, by simply a grant to all schools. Manual instruction should be compulsory in all schools, and therefore the grant should be made in the way I have stated, because the grant would be required in all schools.

12. How is it possible to give manual instruction in all schools?—I cannot answer that question.

13. As a matter of fact, would it not be impossible in some schools?—Probably it would.

14. Would you recommend a system under which payment for manual instruction would be given in regard to those schools where instruction could be given?—The only system I could suggest just now is that the grant should be in proportion to either the roll-number or the average attendance of the particular school.

15. In regard to No. 6, could you explain how you would alter the instruction in agriculture from the present system defined under the syllabus?—That is simply a recommendation that instruction in agriculture should not be considered as intended to produce farmers, but as simply a part of the general instruction given to children, whatever their future in life may happen to be.

16. *The Chairman.*] In other words, an elementary knowledge of agriculture?—Yes. Perhaps not quite so far as that even. Practically an elementary training in applied science, which happened to be agriculture.

17. *Mr. Pirani.*] Then we come to 7A, in regard to arithmetic: How would you define the alterations you would recommend in that particular? What particular standards do you think are overloaded, and how would you distribute the alterations?—The teachers are unanimous on the point that Standards II and V are overloaded—Standard II in so far as they have to show a knowledge of the four money rules; and Standard V for various reasons, chiefly on account of the time occupied in the teaching of vulgar fractions. All the class teachers who have any experience of these different standards agree that in these two standards the work cannot be overtaken without devoting an undue amount of time to the subject.

18. With regard to No. 8, do the Institute mean that they would be in favour of abolishing all payments or awards to scholarship-holders except the lodging-allowance—that they would abolish even an allowance for the purchase of books or the payment of fees?—I do not think that we should go so far as to object to a money grant for the purchase of books.

19. And fees in secondary institutions where there were not free places?—In respect to that, payment of the fees in such schools would be equivalent to granting a free place. We should have no objection to that. We simply mean that in the case of town children the granting of the free place or the free place and the cost of books ought to be sufficient considering the amount of money which would be available.

20. So that poor people in the towns would get no assistance at all except the free place according to your recommendation?—That certainly was not intended.

21. *Mr. Wells.*] As to No. 2B, it is the opinion of the Institute that the compliance is not very speedy, that sometimes there is undue waiting?—That is so; a number of teachers have complained repeatedly that in the case of schools both in the towns and the rapidly growing country districts a request has been made to the Board for a new school or for the enlargement of a school. The Inspectors have reported that an addition is required, and the Board has sent a request to the Department, and the Department has made the grant required; but a very long time seems to elapse between the first overcrowding of the school and the providing of the new school or the addition. In some cases the delay has been so long as ten or twelve months.

22. With regard to the granting of additional assistance where a school is growing, does the Institute consider that the assistance is given quickly enough?—No. In all the cases I know of where there have been rapid increases there has been some complaint from teachers that the school is left for a considerable time understaffed.

23. Is it not a fact that the difficulty is largely increased by the fact that the increase may be made in one portion of the school, but if the total roll-number is divided by the number of teachers the increase is not so great, while in actual practice it is found to press very hardly on

certain portions of the school?—That is so. The school may not be strictly overcrowded, but only overcrowded in the infants' department, while Standards IV, V, and VI may have plenty of room.

24. With regard to the examination of teachers, is there any difficulty in this district in getting teachers to go to the backblocks districts?—There is usually a great reluctance. Most people prefer to live in the towns or in the immediate vicinity of the towns. For distant places applications are not numerous.

25. Are not positions in backblocks schools largely filled by uncertificated teachers?—I presume so.

26. Will not an uncertificated teacher going into a backblocks school look to the obtaining of a certificate as a means of release from that position?—If he obtains a higher certificate he will certainly have a greater chance of removal.

27. Then, if it is made more difficult for him to obtain a certificate, will not the difficulty of getting teachers to take those positions be increased?—It will.

28. You can see no objection to allowing a teacher to take his D certificate in three sections?—None whatever.

29. Do you think that there would be a gain?—I do.

30. Can you tell us how the proposed regulations were received by the backblocks teachers in this district?—I can only say that the matter was discussed at a large meeting of teachers in which I presume backblocks teachers were represented, and the meeting was unanimous in its desire to get that particular regulation altered.

31. *Mr. Kirk.*] Will you define what "young children" means in recommendation 7B?—Children up to the age of fourteen.

32. At what age do children usually leave the primary schools?—Roughly, at about fourteen.

33. So that this recommendation means that mathematical geography should be entirely eliminated from the syllabus?—I believe so.

34. Will you give us your idea of what "mathematical geography" is?—I simply take the word "mathematical"—which may perhaps be loosely applied—from the syllabus. I refer to such matters as the approximately stable position of the earth's axis, in which the revolution of the earth round the sun is taught from observation of the stars.

35. Do you think that that should be eliminated?—I do.

36. Is not that a most fundamental principle of nature-study?—When the syllabus first appeared the teachers engaged in teaching this work in the Auckland District made a very systematic and earnest attempt to teach the different portions of B *in toto;* omitting nothing, and made an earnest attempt to teach all these matters such as were suggested in the syllabus—that is, not dogmatically, but from the observation of the stars. My own experience agrees with the experience of all other teachers I have conversed with, and our opinion is that the matter required from the children is too difficult for them.

37. But how can you teach nature-study well without teaching the effect the sun, moon, and stars have?—One of the difficulties that differentiates this subject from ordinary study is that practically the observation was to be made by the children when they were not in the presence of the teacher. It was to be done at night after sunset. We had no guarantee that the children were taking these observations except by questioning them on the following day as to what they observed. That I believe led to a certain amount of attempted deception.

38. Surely that could be readily ascertained?—It might be.

39. Was it not rather the fact that this mathematical geography should be taught from the primary standard right through the standards up to Standard VI, and that when the more difficult portions of mathematical geography came to be reached in Standard VI, it would be much more easily acquired by the children because of the teaching they had had in the primary standards?—It would be easier, undoubtedly.

40. Mathematical geography deals also with the drawing of maps, I suppose?—I do not know if you would call that mathematical geography. We have no objection to the drawing of maps.

41. Would you not call the drawing of maps part of mathematical geography?—Certainly not, so far as this regulation is concerned.

42. Do you think the drawing of maps should be eliminated from the syllabus?—I do not.

43. Does the Institute really lay great stress upon this? I have read this regulation through, and it seems to me that if it were eliminated, and if teaching of the subject were eliminated, there would be a most awful absence of teaching of fundamental principles?—If you take the matter of the cause of the seasons and wish to teach that it may appear a simple matter well within the scope of the intelligence of children of thirteen and fourteen years of age, but we do not find it so. A class might be taught in this way: that "the cause of the seasons is the revolution of the earth round the sun taken in connection with the slope of the axis," but there are so many things in that statement which a child must previously understand, and understand very clearly, or the answer is of no use whatever. The revolution of the earth round the sun he can understand. As to the slope of the axis, he must previously have learned what the axis is. The slope of the axis may be taught dogmatically to him, or he may be taught by observation. The slope of the axis is an extremely difficult thing to teach by observation. It slopes a certain way to a certain number of degrees. This is supposed to be taught experimentally by observation. He can be taught what the orbit is, but to teach what the plane of the orbit is is rather more difficult. When you have all these difficulties, they amount to a considerable difficulty to a child of fourteen.

44. But you and I have gone through it; you were taught mathematical geography as a child, were you not?—I can quite admit—taking any ordinary class in Standard VI—that we have a certain proportion of the scholars, but a minority, who can understand these things with ordinary intelligent teaching very well, but I am talking of the bulk of the class, and it is my experience, and the experience of the teachers I represent, that for the bulk of any ordinary Standard VI that particular lesson is too difficult.

45. Is it not because they may not have had the necessary preparation for it in the lower standards—that there has not been a gradual working-up to the higher branch of mathematical geography?—That may be. I cannot answer that definitely.

46. *The Chairman.*] Is your experience of the Standard V pupil sufficient to enable you to say that when he comes to Standard VI he is sufficiently grounded in the requirements of English, geography, grammar, and arithmetic to enable him to do justice to it?—I think, on the whole, I may say Yes to that.

47. *Mr. Poland.*] Is it not a two years' course?—Nominally it may be taught in Standards V and VI. Practically it is taught in Standard VI.

48. *Mr. Kirk.*] Is it not necessary that a boy turned out of school at fourteen should have this knowledge?—No. I think it might very well be left to the secondary course.

49. *Mr. Poland.*] In what respect do you suggest that the arithmetic teaching should be curtailed?—For example, the teaching of compound interest in Standard VI might be omitted. The more difficult portions of compound proportion might be omitted. Many of the questions that are put might be simplified even if the subject itself were left. Decimal fractions might fairly be left, but the requirements in decimal fractions might be lessened in the matter of examination.

50. You suggest that the course of instruction in arithmetic should be of a more practical nature than at present. You think that the omission of these subjects would have that effect?—Yes. Take the one example I have given of compound interest. That does not enter into the experience of most men, and might well be omitted. I may say that we do not complain very urgently that the syllabus in regard to arithmetic is very far from having a bearing on practical work. On the contrary, a great deal of it has, but if it can be made more practical we should like to see it done, and certainly it ought to be lessened in the total amount.

51. Parents have complained to me very often that a child leaving school after passing the Sixth Standard, and obtaining a certificate of proficiency, may be asked by his father to work out some simple arithmetical problem, and he knows nothing about it. Surely a child leaving school after passing the Sixth Standard should be able to do work of that nature?—One point on which all teachers that I know are agreed upon is that whatever is struck out, the one thing that is wanted and that we do not get is mechanical accuracy from the lowest standard to the highest. I should be very glad to see certain things struck out of the arithmetic syllabus in the upper standards, provided that we could in their place get mechanical accuracy.

52. *The Chairman.*] Would the striking-out of these things give time to ensure accuracy?—It would.

53. *Mr. Poland.*] Would it not give more time for the rural course, botany and zoology?—Mechanical accuracy in arithmetic is extremely desirable, and it should not be sacrificed to anything.

54. About how many hours are provided for arithmetic in the upper classes?—Five hours a week, as a usual thing. In Standards III, IV, and VI, five hours should be sufficient to teach them from this syllabus. In Standard V, if you want to cover the whole of the ground, you should give about seven hours to arithmetic to comply with the present syllabus.

55. Do you give Standards V and VI home work in arithmetic?—Not usually.

56. In any subjects?—Yes. The subjects usually given are such matters as preparation of reading and spelling for the next day, but very little written work.

57. *The Chairman.*] Ought there, under any conditions, to be any necessity for giving children home work in arithmetic?—I think not.

58. Why in arithmetic more than any other subject?—Because arithmetic ought to be done in school, whereas if you want a child to understand the reading-lesson you might fairly ask him to read it over the night before.

59. You do not think that the teaching of the principles of simple interest in school would be of advantage, and that the child should have a little practice in it at home?—I would prefer that he should have his practice in school. At home he can get his elder brother to work it for him. At school he must do the work himself or leave it undone.

60. *Mr. Thomson.*] The Institute are in favour of the centraliaztion of small country schools. I suppose you are aware that amongst country residents the proposition is not favoured?—I believe that there is some opposition.

61. I gather from the remit that you would make it mandatory?—Yes; I do not see how it can be of any value unless it were made mandatory.

62. Recognizing that there is opposition, do you not think we should work along optional lines—that the School Committees of the districts affected should have power to vote on the question amongst themselves? Would not that be more in harmony with public opinion, and preferable to making it mandatory?—I am afraid I could not say Yes to that. I should prefer to make it mandatory.

63. Do you not think that centralization could be carried out in some of our cities or towns? Do you know any town in the Auckland District where there are a number of schools some of which could be abolished and the children sent to a central school without impairing the efficiency of the instruction imparted?—At present I am not able to think of any such case.

64. At any rate, if centralization is good for the country it is also good for the cities, if it would save expense and improve the instruction imparted?—Quite so; with this difference: that in or near the cities you seldom have small schools which it would be advisable to close.

65. With respect to the question of putting all the Inspectors of the Dominion under a Central Department, can you say whether the Auckland Inspectors have signified their approval of that particular remit from the Conference?—No. They have had no opportunity of doing anything of the sort

66. I notice the Institute is of opinion that the cost of education should be provided for by general taxation, and that no portion should be raised by local rating. What is the principal reason for that proposal?—The only reason we have is this: that if a portion of the cost of education is to be thrown on local rates it would often happen that in scattered country districts, where the standard of education of the inhabitants is not high, and where a large amount of money is needed for roads and other works, the local rating would be stinted by comparison with more densely peopled districts of the Dominion.

67. What is your experience as a teacher with regard to the free school-books?—The experience generally of teachers is that the books provided are certainly of use in the schools, and are generally and fully used in the schools, but there is the drawback that those books cannot be taken home to be made use of at home. On the whole, the teachers would have preferred to see that money given for the purchase of school stationery, leaving the parents to buy the books that could and ought to be taken home.

68. *Mr. Wells.*] You mean the principal reader? That would not apply to the continuous readers that are supplied?—No. The continuous readers might very well be dealt with as they are now.

69. Do you consider that the syllabus generally is overloaded?—That is a very large question. If the syllabus is to be taken as I believe it was intended to be taken, as to a very large extent optional, and selections are to be made from it, I think the teachers I represent very strongly approve of the syllabus as a very marked improvement on the old one. The only objection to it is that occasionally we have found ourselves required by an Inspector to teach a large section without being able to make selections from that section.

70. But does that hold in this district?—No.

71. *Mr. Thomson.*] I would like details of that scheme. You say you make selections. Will you give us an illustration?—The best example I can give is on pages 30, 31, and 32 of the syllabus. In the middle of page 32 you have Course B in geography. There is no misunderstanding about that now, but there was at one time, and there may be still in some districts. Course B in geography on these pages contains a very long and very valuable list of subjects for the teaching of geography. If teachers are allowed to select what they please from that list, they have a very large amount of material from which to select. If they are required to teach all, they cannot do it. If they are required to teach an unduly large amount of it, the work becomes very difficult.

72. Are they required to teach too much of it?—In this district we are not. We are required practically to teach what we think sufficient.

73. Does that remark apply to other portions of the syllabus as well as to geography?—To some, but not to all.

74. *The Chairman.*] Will you specify the portions to which it does apply?—It would be more easy to specify the portions to which it does not. For example, portion of pages 20, 22, and 23. Here you have the requirements in arithmetic. On page 23 you have the Standard IV arithmetic. We are required to teach the whole of that paragraph. We do not object to it, but we have no choice; we may object or not, but the scholars are required to know that work.

75. *Mr. Thomson.*] Do you think a teacher should be allowed to exercise a choice in that subject?—No, I do not.

76. Do you think that that could be improved?—It might be improved chiefly in the way of curtailment.

77. By that, then, you admit that the syllabus is overloaded?—I do.

78. And if overloaded there it may be overloaded also in other parts?—I maintain that the arithmetic course as a whole is overloaded, not that the arithmetic course in Standard IV is overloaded.

79. Do you think it is a fact, as a result of the teaching in our primary schools, "that in a few short years after the admission of a bright, imaginative, and talkative child into the school he is converted into the irresponsive and circumscribed schoolboy we have to-day"?—I think that that is a very wild statement.

80. In regard to the study of mathematical geography, you believe it is beyond the comprehension of the child?—Beyond the comprehension of the average child.

81. Do you think it is possible to teach that subject by means of pictures?—No.

82. Not by a movable picture?—No. It would be distinctly better than a stationary picture, and the orrery itself would be distinctly better than a moving picture.

83. In giving evidence you said that it would be beyond the reasoning-powers of a child to understand the meaning of an axis?—Beyond the power of the bulk of the children attending the school.

84. That is the reason why you would eliminate that from the syllabus?—Yes.

85. As a practical teacher, do you think that instruction could be comprehended by the children by means of a movable picture?—It could be given and could be comprehended even without the aid of a movable picture; but we maintain that the effort on the part of the children is very great and very continuous before they understand that. It has to be repeated again and again and explained by all sorts of devices, and that finally you can get the children to answer these questions at the end of the year as if they understood them, and the answers in many of the cases are learned by heart simply because they have to be learned in some way. Now, we think that is not a satisfactory method of spending school time, and we should prefer to have a subject which demands so much abstract thinking eliminated from the syllabus altogether.

86. Do you think the movable picture could be made an adjunct to the school?—To a very moderate extent. I have not very much faith in the movable picture, owing to the difficulties surrounding the production of these movable pictures. If a movable picture could be placed

readily before a class where it was wanted, then it would be of great value, but if you have to darken the class-room for the movable pictures, then you want to show one picture after the other for not less than one hour. Now, a movable picture would be of great value if in the course of one given lesson the one movable picture you want is thrown on the screen, but if you have to show thirty or forty pictures the value is lost to a very great extent.

87. *Mr. Davidson.*] You are first assistant in the Mount Albert School?—Yes.

88. What is the average attendance in the school?—About six hundred.

89. And the average attendance in the class of which you have charge?—It is forty-one.

90. Have you noticed in the staffing of the schools that where the average attendance is 401 under the new scale there is a headmaster, with six assistants and four pupil-teachers? That same scale of staffs continues until you reach 481—that is to say, no additional assistance is given between 401 and 480?—I cannot answer that question as to the details. We have passed through that stage I know, and we left all the drawbacks of understaffing, and so on.

91. If I tell you it is a fact that no additional assistance is granted until an additional increase of eighty is made, do you think it is desirable that assistance should be given after an increase of fifty?—I do think it most desirable.

92. If there are only a small number of schools between 451 and 480, would it be desirable for the Department to allow the introduction of the new staffing at 451?—I presume it would be desirable, and there could be no serious objection to it on the ground of expense, as the number of schools affected is very small.

93. You were referring to the manual instruction, and you objected to the present capitation grants: would you be in favour of a fixed grant for the teaching of all manual subjects, apart say from woodwork, cookery, and agriculture, being made to the Education Boards?—I do not know. All I can say is that our objection is simply as a matter of principle. It simply relates to the excessive clerical labour demanded by the present system.

94. Then, if the Boards were granted a fixed sum for the purpose of teaching all these subjects of manual work with the exceptions I have just mentioned, that would do away entirely with this clerical work?—Not necessarily, because the Board may insist on the same system.

95. The Board would not be at all likely to insist, do you think?—Not likely, but it might.

96. You yourself stated that you would have certain branches of manual work taught in all schools: are you aware that in Southland 97 per cent. of the schools do take manual work?—I was not aware of that.

97. And that in Wanganui 93 per cent. of the schools do take manual work?—I knew the percentage was high in Wanganui, but I did not know what it was.

98. Can you account for the fact that in certain districts only 20 per cent. of the schools take manual work, while in another district 97 per cent. of them do—I am quoting from E.–5, page 2?—I cannot account for that.

99. What I want to get at is this: You object, and I know many teachers throughout the Dominion object, to this clerical work required in furnishing returns?—That is so.

100. And you want to suggest some method by which we can get rid of this—what we consider unnecessary work?—That is so.

101. Even if the Board's capitation grant was increased to 12s. 6d., and they were allowed to spend that money as they chose, but it were insisted upon that certain branches of manual work should be taught in all schools, would that not be a more satisfactory method of dealing with manual work?—It probably would, but, so far as the teachers are concerned, all they have really instructed me to put before this Commission is their objection to the amount of clerical labour demanded, feeling quite certain that it is within the powers of the Central Department to devise some other scheme if the present scheme is abandoned.

102. *The Chairman.*] By which the instruction could be given and the amount of clerical labour cast upon the teacher could be avoided at the same time?—That is so.

103. *Mr. Davidson.*] It would be interesting to the Commission if you were to give the nature of these returns required?—I cannot very well do that, because I have personally so little to do of it myself. I am speaking not for myself, but for the teachers.

104. Have you taught the subject of elementary physical measurements in your school?—No.

105. Do you know the capitation grant made for the teaching of that subject?—I do not remember it.

106. Do you think that elementary physical measurements might be taught in connection with drawing, geography, and arithmetic?—As a matter of fact, in arithmetic and in drawing we already do a good deal in the way of elementary physical measurements, but I do not know how much further we would have to go to comply with the regulation.

107. The total payment by the Department for manual subjects was about £19,000 a year. If a somewhat simpler method than the capitation-grant method were adopted, do you think that amount might be considerably reduced without impairing the efficiency of the instruction?—It seems to me that whatever the amount is the cost of distribution must be considered, as the labour of the teachers in sending in these returns has to be paid for in some way. The labour of the clerks employed by the director of the Technical College here must be reckoned in some way. A good deal of that labour, it seems to us, could be avoided, and a good deal of that cost could be saved, but I do not know how much.

108. And necessarily also a saving of the teacher's time?—Yes.

109. This manual work in Auckland is in charge of the Director of the Technical College?—All applications for materials are sent to him.

110. Do you know whether that is so in any other district in New Zealand?—I do not know.

111. Is not the technical school here under the absolute control of the Education Board?—Yes.

112. Speaking of free books, do the pupils in your class provide themselves with their own books?—Standard VI has just been reached by that system this year, and in my class the parents of the children provided the books in the ordinary way at the beginning of this year, and after these books had been provided by their parents a large consignment of free books of various kinds was delivered to us. Some of these, at all events, have simply been put into the cupboard, and stored away for next year's requirements. I cannot use all the books that the children have in their own possession and all the books provided by the Department, but next year the pupils will not be required to provide their own, but will be required to use those provided.

113. Is it not a fact that even in the classes below Standard VI, where books have been provided free for some years, that in the cupboards of these rooms will be found many books that are supplied for use, but are not used because the children buy their own books?—To my knowledge, I do not know of any such case.

114. It has been stated that as a result of the free-book system at least 85 per cent. of the children in the Dominion provided themselves with books prescribed for use, and that it simply means the booksellers and publishers are putting out nearly double the number of books?—I am not aware that the percentage is anything like that.

115. Take the arithmetic books, for instance: would you advise your pupils to purchase books of their own, so that they might study their work at home as well as in school?—I do not know that I should advise them to buy books if similar books have been provided by the Department, on the ground of putting them to needless expense, but I should very much prefer that the Department should not grant arithmetic-books, and that the children should provide their own.

116. As to the unnecessary multiplicity of small schools, how would you remedy the evil?—The only possible way that has occurred to us is that in districts where the scheme is practicable, some of these smaller schools, which are taught usually by a comparatively inefficient teacher, should be closed absolutely, and the children should be conveyed to some central school where there is, we will say, one efficient teacher and a duly qualified assistant, so that instead of having, say, three or four schools with an average attendance of twenty each, you would have one school with an average attendance of sixty or eighty, and where we may naturally expect the teaching would be much more efficient. The cost would be less, too.

117. Have you compared the percentage of sole-teacher schools in New Zealand with the percentage of such schools in the Australian States?—No, I do not know the comparison.

118. We find that 61 per cent. of the schools in New Zealand are sole-teacher schools: are you surprised at the number?—No, I am not surprised.

119. The advocates of the consolidation of the country schools claim that punctuality and regularity in attendance, the general health of the pupils, the moral tone of the pupils, and the efficiency of the teaching are improved: is that your opinion?—It is with respect to most of these matters you mention. I do not see how the health can be very much affected in either way, nor perhaps the moral tone.

120. In country districts children frequently have to travel far. They come to school in wintry weather very often in wet clothes, and if instead of having to walk this distance they were conveyed in vans, as they are in many parts of America, they would reach the school dry and comfortable: would that not improve their health?—I do not think so, necessarily. I think you are overstating the case. I am thinking of two schools three miles apart. One school is to be closed, and the vans must start from somewhere near where that small school stands. The children who originally attended that school would still have a considerable distance of country to cover through the rain or mud to that van centre before they could get into it, and they would be carried to the central school wet, and not dry.

121. *The Chairman.*] Is that a fair assumption? Is not rather the plan that the children are called for at their home, no matter where it is, within reason?—In the case I am thinking of they would have to walk, because they could not be reached by 'bus.

122. *Mr. Davidson.*] I am just now thinking of an instance in America where those who have studied the question give absolute proof that that was so as to the moral tone improving. Is it not likely that children going to and from school are more likely to be contaminated than if they were conveyed in fairly large numbers?—It would be the case, but I should not be disposed to lay very much stress upon that.

123. Regarding the present syllabus, head teachers have the right to make out their own programmes of work for every class in the school and in every subject: is not the present syllabus more suggestive than mandatory?—So we teachers understand it.

124. Then, the objections that have been raised in many parts of the Dominion are mainly on account of the interpretation by Inspectors of that syllabus?—That is so.

125. As to the new regulations for the examination and classification of teachers: have you read the requirements for the teachers' D certificate in elementary hygiene and first aid?—I do not think I have read all that in detail, but I know pretty well the work. I have gone through it.

126. It has been stated that there are no fewer than two hundred topics in that one subject?—I have heard that stated.

127. Do you consider the requirements in that particular subject excessive?—That, of course, must be taken in connection with the question of the importance of that one subject compared with the other subjects in which the candidate has to sit. Considered as a subject by itself, the requirements there may not be excessive, but the possible time required from the student might be excessive.

128. Have the difficulties been greatly increased by making that subject compulsory, and by also making the subject of elementary mathematics for men compulsory, as compared with the old requirements?—I have no doubt that it has had that effect. With respect to the elementary hygiene, first aid, and so on, if this is simply an addition to the previous requirements it undoubtedly has added very considerably to the work. I know roughly the amount of work required there, and it is very considerable.

129. Do you think it would be wise to allow any teacher sitting for the D certificate to receive credit for any one or more subjects in which he passes?—I do.

130. *The Chairman.*] I was going to call your attention to section 5 of your remit—the cost of education should be provided by general taxation, and no portion raised by local rates—can you indicate to the Commission what the mind of your Institute is upon the question as to what the cost of education is intended to cover?—We considered simply the whole cost of elementary education; we did not consider anything beyond primary education.

131. You are not taking into account the cost of technical education at all?—No, not in this.

132. *Mr. Wells.*] Do you know of any complaint in this district in regard to the clerical work required of teachers outside that required for the manual-work returns?—I do not know of any recent cases.

133. There is no grumbling about the amount of clerical work?—Not now.

134. Or in connection with the drilling?—Some years ago we had many complaints to make, but not recently.

135. *Mr. Davidson.*] You stated that your objection to local taxation for educational purposes was mainly on account of the sparsely populated districts being unable to provide the same facilities for education as the more densely populated parts can do. If the Government granted subsidies upon a sliding scale upon the amount raised by local taxation, would that not make provision for the education in these districts?—The difficulty might possibly be got over in that way.

NORMAN RODERICK MCKENZIE examined on oath. (No. 4.)

1. *The Chairman.*] What are your educational qualifications?—B1.

2. What are you?—Headmaster of the Mount Eden School, and President of the Headmasters' Association. I have seen the statement handed in by Mr. Campbell, and I wish to amplify that on behalf of the Headmasters' Association. In regard to some points, I have not consulted my own Association, and in this I will simply offer my own personal opinion.

3. Do you agree with the evidence of Mr. Campbell, or do you disagree with it?—My association agrees in general with this document.

4. You heard Mr. Campbell give his evidence: are there any points in it to which you take exception?—Nothing vital.

5. There is nothing of importance in the matters he touched on with which you differ from him?—Nothing of any importance.

6. We would like to hear your statement as the mouthpiece of the Headmasters' Association?—The first point has already been touched on. We strongly support the abolition of small Boards, and I shall deal with that more fully under clause 5. As to clause 2 of the order of reference, my association is strongly in favour of breaking up the class D into two or three sections. The reason is this: we get many pupil-teachers entering the service through the Boards' candidates' examination, which is very little in advance of Standard VI. They have to work from four to five hours, and I think, taking our district as a whole, even the first-year pupil-teachers have to work five hours—not in every school, but in many schools. The result is that they find it extremely difficult to deal with so many subjects at the time, and to deal with them satisfactorily. We consider there are far too many subjects in the first section. There are some fourteen subjects altogether, and the candidate has to attempt something like twelve, though not necessarily to pass them all. Several of these twelve subjects he may fail in, but we consider it is better to take fewer. With regard to the class B examination, we think that every candidate should pass in the subject of education up to the B.A. standard. Education is such a very important subject that we think it should be made a compulsory subject up to the B.A. standard. It is only compulsory now up to the class C standard. In the class C paper we consider that the B.A. subjects which they have to take should include education. To get B you must take at least three subjects to get to the B.A. standard. As to clause 3 of the order of reference, we strongly support the Dominion system of promotion of teachers, based on the principles advocated by the New Zealand Educational Institute. These are the clauses in the report of the Institute: "2. That the following principles are essential to any sound scheme of promotion: (*a.*) Efficiency of the service must be the first consideration in the appointment of any teacher. (*b.*) In the grading of teachers for promotion, efficiency of the teacher must be the first consideration, and literary or other qualifications, as well as length of service, must be subordinated to this. (*c.*) The efficiency of the teacher can be gauged only by experts. (*d.*) Provision must be made for appointment on merit. (*e.*) Provision must be made for the grading of classes in a few well-defined grades. (*f.*) Other things being considered equal, seniority of teacher should then be the determining factor. (*g.*) Each teacher's prospect of promotion should be shown as definitely as possible on a promotion list, which should be revised at periods not greater than one year. (*h.*) The necessity for a guarantee against reduction of salary (except on proof of loss of efficiency)." That has been provided for by recent regulations. We feel, also, that there should be some right of appeal. That is the weak spot in the Auckland scheme. In the Dominion system, of course, the pull would be to the Minister. I might explain that in Victoria a similar system is in force. The appeal there is to the Public Service Commissioner, and I notice in the *Gazette* that appeals are frequently successful. In every year there are several successful appeals.

7. *Mr. Poland.*] Are the appeals frequent?—Yes; I think the appeals are more frequent than the successes. As to clause 4 of the order of reference, that has been partly dealt with by Mr. Campbell, but we would suggest a Dominion scale of salaries for manual-training teachers and teachers in technical schools. We are of opinion that manual training should be a part of the ordinary curriculum in every school. As to clause 5 of the order of reference, I have mentioned the abolition of small Boards is advocated. We think about four Boards could manage

the educational affairs of the Dominion. The districts might well be the present University districts. We think that the election should be on a popular basis, instead of by School Committees. We think that these Boards might control primary, secondary, and technical education within their district, and that the qualified teachers may be moved from one kind of school to another if considered necessary—that is, from the primary to the secondary schools, or from the primary to the technical, and *vice versa*. The advantage of having the secondary schools as well as the primary under the control of one Board would be that it would give some unity to the scheme of education. At present it is more or less disjointed. It would also give the teachers a broader outlook. If a man passed through a primary school to a secondary, or from a secondary to a primary school, he would naturally have a wider outlook on educational problems. The abolition of the small districts, with their office staffs, and so on, would save money, and the formation of larger districts would give teachers some equality of opportunity for promotion—an equality that does not exist at the present time. We did not consider clause 6 of the order of reference in regard to overlapping and duplication. As to clause 7 of the order of reference, we would suggest a liberal subsidy to local voluntary contributions towards primary education such as now is given in the case of technical schools and district high schools. I might quote a case in point. In my district we collected £110 for the improvement of the schoolgrounds recently, and the Education Board were good enough to give us a grant of £1 for £1 up to £100, but they thought that they were treating us in a rather excessively liberal way. I think that if the Department encouraged local effort of that kind, it would result in a saving to the Department in the long-run, and it would also arouse local interest in the welfare of the school. As to clause 9 in regard to the syllabus, I have a good deal to say. First of all, we think that no subject has any right to a place in the syllabus unless it is of value both educationally and practically. I should like to make clear that by "practical" I do not mean "technical." We do not want to produce tradesmen in the primary school. By practical I mean the subject should have an intimate relation to the life of the child, and his future career, as well. I should like to add at this point to what Mr. Campbell said: that we in Auckland are strong believers in this syllabus. The faults with which it has been blamed are nearly always the faults of interpretation, but like every other human product it is capable of improvement. There are a few suggestions here. I quote now from the report of the New Zealand Educational Institute, 1910. This is a report of a committee of the Institute of which I happen to be the convener, dealing with matters connected with this syllabus. Under the heading of "English" there is a suggestion that in the subject of writing encouragement should be given to the acquirement of facility in conjunction with legibility. There is a feeling that much school writing at the present time is more drawing or engraving than writing. It is done so painfully slowly. We are not anxious to see poorer writing, but we wish quicker writing, and we think there should not be much difference between a child's writing test and the writing he does in his composition exercise, for instance. It would be better to have less perfect writing fixed and a more perfect specimen of penmanship in his ordinary written work.

8. Can you supply a few concrete illustrations of the work done under the syllabus in your school to show what is actually done?—Yes; as a matter of fact, I aim at this in my own school. In Standard VI, which I have just been examining lately, I can think of one child who wrote seven pages of paper of foolscap size in an hour and a quarter in a composition exercise, and it was all good, clear writing—not, of course, as good as the writing test, but as near to it as you could expect. That, of course, was the best in the class. I do not say the whole class could do that, or anything like it. We aim at getting speed as well as beauty of form. There has been a good deal of talk about the question of technical terms in connection with grammar. This is the finding of the committee I speak of: "That in examination tests there is no objection to the employment of the technical grammatical terms used in the present syllabus, provided that formal definitions of these be not required." Under the old system the examination in grammar consisted very largely in requiring definitions to be learned in the period, and that was often done without any real understanding of what was being done. We feel that when a child has an idea, for instance, of an adjective clause, it is a proper thing that the child should have a word to express that idea, but we do not think the child should be required to give a clear logical scientific definition of every word he uses. Now, the work in arithmetic we are all agreed requires readjustment. We have a fairly long report on this particular subject. It is very much on the lines of Mr. Hogben's own suggestions: "(*a.*) That the syllabus in arithmetic should be reduced, and also recast, so that the burden of work may be more equally distributed among the standards. In this connection attention is directed to the great amount of arithmetic demanded by the New Zealand syllabus as compared with the requirements of the English Board of Education, and is of opinion that education in the Dominion would gain considerably if a syllabus approximating to scheme B (England) were adopted. (*b.*) That the heavy arithmetic syllabus frequently interferes with the general progress of the pupils, as the work in other subjects is often retarded by the undue amount of attention given to arithmetic. (*c.*) That since it is not advisable to attempt to teach the whole subject in primary schools, technical schools, or individual effort outside of school. (*d.*) That since education should aim at adjusting individuals to their environment, arithmetical exercises should be drawn from the actual surroundings of the children, should be in the form used in daily life, should be taught practically, and should be suited to the age of the pupils. (*e.*) That the foundation of success in this subject is unremitting practice in mechanical operations connected with commercial and everyday life, especially mental work. (*f.*) That accuracy, speed, and neatness in mechanical work must be aimed at in all classes. (*g.*) That up to and including Standard VI, the greater part—say, 60 per cent.—of the examination should be mechancial, and should include concrete examples. Tables should be carefully and practically taught. (*h.*) That in Standards I and II only one principle should be introduced

into a problem. In Standards III and IV not more than two principles should be introduced. (*i.*) That the necessary apparatus to teach this subject—sets of accurate weights, measures, &c.—should be supplied by the Department to each school, so that the subject may be taught practically." In Geography this is the finding: "(*a.*) That, although the A and B courses are equally compulsory in the present arrangement of geography, whereby the B course may be treated in eighty hours, while the extent of the A course demands a very much greater allotment of time, there is a comparative neglect of political geography, and an undue emphasis of the mathematical and physical, and the subject generally, especially in the upper standards, is receiving too large a share of the school time. (*b.*) The Institute therefore suggests—(1) That there be only one course in geography, comprising all necessary topics; (2) that the teacher is required to draw up his scheme of work from these topics; (3) that sixty hours per year in the classes Standard III to Standard VI be suggested as sufficient time for this subject." That is, an hour and a half per week throughout these standards. The Institute also suggests that geography should be removed from the list of compulsory subjects from the Standard VI proficiency examination so far as the individual pass is concerned. The object of this is, of course, to give the teacher freedom of choice in the examination as set in Wellington or in the Board's office on the subject. Of course, the teacher's right of choice is interfered with. As to the subject of history, we think this should receive more attention. This is the suggestion: "That the subjects in history should be systematically grouped and arranged, and a concentric series of historical readers should be used"—of course, in addition to proper oral lessons on the subject. We do not advocate teaching history from books only. We think the use of books should follow on the giving of oral lessons by the teacher. As to the subject of drawing, girls taking a class in manual training need not be taught geometrical drawing, but they have to take it for scholarship examinations, and we recommend that geometrical drawing should not be required either to be taught to them, nor should they be examined in it. In this district our girls are handicapped fifty marks because they are not, as a rule, taught geometrical drawing in the schools on account of their going to the manual-training school. There is a suggestion about sewing. I am not an expert on the subject, and I leave that to the ladies to deal with. Finally, we suggest that the Department periodically issue a pamphlet similar to the suggestions for teachers issued by the English Board of Education on the general scope of the syllabus. In connection with that I might explain that we look upon the syllabus not as a fixed quantity at all, but as a sort of organism which must steadily grow, and that when the Department thinks that additions or alterations or omissions should be made they should issue this pamphlet, explaining the position, and also giving the teachers the latest ideas on the teaching of the various subjects. Now, physical training is a subject which has not at all received the attention it deserves in many of our schools in the past. I think this is a most essential subject, and that very great emphasis should be laid upon it. In this connection I should like to point out that the lessons in drill given to cadets seem to be unduly long. The boys have to drill for an hour at a time, and this is a violation of the principles of physical training. The modern idea is to have boys for a few minutes every day. I should compare the present system of giving an hour a week and having none in between to very like giving a boy a dinner once a week and letting him starve the rest of the time. The teaching of hygiene and the laws of health I think might be emphasized somewhat more, and in connection with that a resolution was passed at the annual meeting of the Institute in favour of teaching sexual physiology in the schools, both to boys and girls, but not by the teachers. The vote was absolutely unanimous on that point.

9. *The Chairman.*] Up to what standard?—Not until they were approaching the age of puberty. It would not do to teach these things too early, and of course the teaching would need to be done by experts who would handle the subject in a very tactful way. There was a general feeling that a very great deal of sexual immorality was the result of ignorance rather than of vice in the early stages, and that this could be corrected by proper instruction at the right time. In connection with physical training, the question of better play-grounds arises. The present condition of many of our large schools is an absolute scandal in this respect. There is one large school in Auckland not a mile from where we are now sitting where the children actually play in the streets; that is the play-ground for a great number of them.

10. The only play-ground?—They have a sort of play-ground about as big as an ordinary back yard, and so they have to play in the streets, and I think they drill there, too, although I would not be sure of that. The question of furniture is also inseparably connected with physical training. It is a well-recognized fact that if a child sits in a desk which is too low or too high he is subject to physical troubles. Adjustable desks are now obtainable. They are expensive, of course; that is a matter of pounds shillings and pence. Still, it is a vital question. If schools were provided with adjustable desks of the best pattern it would have a very great effect on the children. There are a couple of points I have not consulted my association about, so I had better leave them for the present. They are the question of domestic science and the extension of woodwork in our schools. I would like to give a personal statement on that subject. Some of the time saved in the reduction of work in arithmetic could well be used in reading, and especially reading of continuous matter—that is, standard authors suited to the age of the child. Teaching a certain quantity of knowledge should be discouraged in every way. This is largely a matter for the Inspectors, but there is often a tendency to try and get through a certain amount of work and get through it whether it is well taught or ill taught—whether properly assimilated or not. That should be discouraged in every possible way. That is connected with the question of examinations. It is a very difficult thing to get assistant teachers to believe that their future does not depend on examination-passes. If they could be persuaded that their promotion does not depend upon cramming in a certain quantity of knowledge in a given time this thing would go; but we cannot get rid of it until we get rid of very much of our examination work. In connection with the classification of children, it is advisable not merely to have standard classes, but to have these

classes arranged in groups within the standard—say, three or four groups, and each group containing children of about equal capacity. This, of course, can only be worked in the larger schools where there is a liberal staff. Now, I wish to emphasize once again the danger of confusing manual training and technical education. The complaints we hear made against the primary school more often than not arise from the fact that the public expect us to turn out tradesmen, clerks, and such-like. I find it also in connection with the cookery classes. A mother finds that her daughter has been attending a cookery class for a year or two, and still the mother can make a cake better than her daughter, or wash a floor better, or something else about the home, and then she at once condemns the system of instruction; so in introducing these subjects in the syllabus care must be taken to make it perfectly clear that no technical education is to intrude itself into the primary school. The Institute passed a resolution last January asking the Department to supply lantern-slides to schools having lanterns. It was suggested that these slides could be issued instead of the pictures now being issued by the Department—that is, to save expense. We have no objection to receiving pictures, but if we cannot have both slides and pictures we find the lantern-slides more useful where a lantern is procurable. I wish to submit to the Commission a letter which was sent by the Headmasters' Association to the Education Board through the Institute, and approved by each of those bodies and forwarded to the Department. It is as follows: "Auckland Headmasters' Association, Kohimarama, 2nd December, 1911. Sir,—I am directed to submit for the consideration of your Board the following statement *re* the scale of staffs for schools. During the past year my association has specially considered the various points of difficulty as they have been experienced by its members in the schools of the Auckland Province. As any weakness in staffing must be detrimental to the welfare of some of the pupils concerned, your Board is directly interested in this important matter, and is therefore urged to use its influence with the Minister of Education to obtain the necessary amendments. Notwithstanding the improvements in staffing which have been introduced in recent years, it is still possible under the present regulations for some schools to be so understaffed that the pupils are debarred from a proper education, and teachers are subjected to overstrain. The Minister's declared intention of replacing pupil-teachers by assistants encourages us to hope that the present difficulties will be partly removed in this way. It is very desirable that this plan should be given effect to at the earliest opportunity. The present regulations press unduly heavily on growing schools. In our district, where very many schools are steadily increasing their numbers, much hardship follows from the delay in increasing the staffing, this delay sometimes extending for more than a year. The trouble would be largely removed by the amendment of Table B under the Regulations for Staffs and Salaries in such a way that columns 3 and 4 should be deleted, and the numbers now given in column 2 should be retained under the heading 'Average Attendance Rises for One Quarter.' We regard the penalty of the increased numbers (36 to 40, 80 to 85, &c.) as quite sufficient. If such increase be maintained for one quarter, and the Inspector certifies to the probability of the increase being permanent, then it is absolutely desirable that the staff should be increased without delay. In comparing the treatment of schools of various grades my association notes the comparatively satisfactory treatment of the larger schools (Grade 10A upwards). Where structural difficulties in the buildings of these schools do not prevent suitable classification the children here are comparatively well provided for. In connection with the architectural difficulty, which so often is a bar to suitable division of classes, we suggest for the future a more extended use of 'McCabe hangers' instead of fixed partitions. Except as noted above in the case of growing schools, the staffing of small schools up to Grade 5 is fairly satisfactory, and the Minister's promise to replace the pupil-teacher of Grade 5 by an assistant will lead to a decided strengthening of staffs. In schools of intermediate grades (6, 7, 8, and 9) the staffing is much less satisfactory. Where, as frequently occurs in our province, these happen to be growing schools, the difficulties of organization are very real, and children and teachers suffer in consequence. My association considers that the substitution of assistants for some of the pupil-teachers in these grades is urgent. In Grades 9A and 9B a strange anomaly occurs. While Grade 9A receives the same staff as 8C, 9B gains both an assistant and a pupil-teacher. A better adjustment here seems easily possible. A somewhat similar adjustment between 9C and 10A also seems desirable. It should be noted that when epidemics occur the staffing is somewhat seriously affected, and as the reduction of staff takes effect not during the epidemic, but subsequently, when the attendance is again normal, the staffing is then insufficient for the work. Although regulations have been gazetted to minimize this difficulty, they do not sufficiently meet the case of the growing school. The substitution of a quarter of the preceding year for the quarter affected by the epidemic, while satisfactory in the case of a school with an approximately stable roll-number, is unsatisfactory in the fast-growing school. We suggest that clauses (*a*) and (*b*) of the regulations be amended so that the quarter affected may be entirely omitted from the calculation of the yearly average—*i.e.*, the averages of the three quarters unaffected by epidemic should be totalled, and this sum divided by three. In recommending your Board to urge the Minister to take these matters into serious consideration, my association cannot emphasize too strongly the special difficulty under the present regulations in the case of all growing schools. As these constitute a very considerable number in our district, the Auckland District is specially interested in an amendment to this regulation. It seems to be quite a common thing for a school to be working in a grade above that for which it is staffed.—I have, &c., D. CHADWICK BROWN, Hon. Sec. The Secretary, Education Board, Auckland." The following is a report on memorandum from the Headmasters' Association *re* staffing of public schools: "Several matters of the first importance are referred to in this report, the following being a brief summary of those most in deed of attention: (1.) Additions to or withdrawals from staff—The delay in increasing the staff in certain cases militates greatly against efficient work, and it would be a step in the right direction to hasten both the additions to and the withdrawals from the staff on the recommendation of an Inspector. If, in the Inspector's opinion, the increase in attendance is such as permanently to bring a school into a higher grade, or the decrease in attendance such as permanently to lower the grade in which

the school is placed, the increase to or withdrawal from the staff should at once be made. As has been pointed out, this is a matter which specially concerns this district, where there are so many growing schools. (2.) Substitution of Assistants for Pupil-teachers—The substitution of assistants for pupil-teachers in schools above Grade 6A is most desirable, implying, as it does, the abolition of all pupil-teachers. But it must be remembered that in this district, owing to phenomenal expansion, the difficulty of obtaining suitable assistants is becoming greater each year; so that it is questionable whether it would be in the interests of the service to advocate any further reduction of pupil-teachers just at present. To strengthen the staffs of the higher-grade schools by the withdrawal of pupil-teachers and the appointment of assistants would certainly tend to accentuate the difficulty of obtaining suitable applicants for our sole-charge schools, and would probably result in the appointment to low-grade schools (and these are in the majority in this district) of relatively inferior teachers. (3.) Anomalies in Staffing—The anomalies to which attention is drawn in the staffing in Grades 9A and 9B, as also in Grades 9C and 10A, seem to call for some amendment. (4.) The Effect of Epidemics on Staffing—The suggestions made under this head to meet the case of the growing school appear to have much to recommend them. I would recommend that copies of the memorandum from the Headmasters' Association, and of this report, be forwarded to the Education Department, Wellington, where it is to be hoped that steps may be taken to bring about such modification of regulation as will lead to improved staffing conditions.—E. K. MULGAN, Chief Inspector." I desire now to make some observations under clause 11, as to examinations. I would point out that some pupils in Standard VI are obliged to have three examinations one after the other at the end of the year—the periodical examination at the end of the year, the proficiency examination by the Inspector, and frequently the Free Place and Scholarship Examination by the Department. We consider that one of the examinations should be sufficient. I do not suggest which one, but that one examination would be ample for all requirements. With regard to the periodical examinations, we suggest that there should be two a year instead of three. We also suggest that it is quite unnecessary and undesirable, and a waste of time, to assign numerical marks to the work of every child in every subject. The Inspector's visit with notice is also open to objection. I think it should be abolished, because it leads to cramming, as under the old standard examination. What we ask for is less examination and more inspection. In this connection the question of records and returns is of great importance. The headmaster of a large school has an unduly great proportion of his time taken up in keeping records and holding examinations, and seeing that returns are made—time which would be far better spent in supervising the educational work of the school. There is a feeling that the time has arrived when kindergartens might very well be started in the more crowded centres, and that provision for the education of abnormal children—whether mentally or physically abnormal—should be made in the larger centres. With regard to superannuation, I would ask the Commissioners to regard particularly its bearing an inducing an old and infirm teacher, a man past his prime, to accept a position or to leave the service. When the Act came into operation many teachers did not come under its provisions. The result is that there is a temptation for those teachers to continue at work when they are really unfit for duty. I would suggest an amendment of the Act to allow them to come in. Another point is that we should like the superannuation to be calculated on the three years in which the man has received the highest salary rather than his last three years in the service. The reason is this: A person may have charge of a Grade 10 school, and may, by reason of infirmity, be unable to carry on his duties as he should. He would not care to give up that position because of the financial loss in the matter of superannuation. Not only that, but the Board would have some compassion upon him, and would probably not remove him. So that the service would benefit by inducing him to take some lighter employment in his later years without reducing his superannuation accordingly.

11. *Mr. Davidson.*] What is the average attendance at your school?—The average for last quarter was 926.

12. What, in your opinion, is the most desirable size of school?—My personal opinion is that a school of that size is the most easily conducted under the present scale of staffing. You can group your scholars within the standard. For instance, my Standard I is a class of 150 or 160, and Standard II numbers between 130 and 140. In each of those classes I have three separate groups, and there are three teachers—two assistants and a junior—attached to each class. In my opinion, those two are the most satisfactory classes I have had to do with in my whole experience. At the same time, I must admit that the bulk of the teachers favour a smaller school, and then there would be more headmasterships available.

13. Does not the time that must be taken up by the headmaster of such a school in examining the children and tabulating the numerical marks encroach very considerably upon the time he, as headmaster, could give to the supervision and instruction of the weaker teachers?—It does. I get over it by delegating the clerical work to assistants.

14. If your school were reduced in average attendance, would your salary be affected?—Not in the least.

15. What, then, do you think was the object of the Department in limiting the salary, or providing the maximum salary for a school of 600?—I presume it thinks a school of 600 is large enough for any one to manage. I may say that for the month of February our average attendance was 942.

16. Do you think it would be an advantage to teachers, particularly to inexperienced teachers, if the Department in New Zealand were to issue something on the lines of the "Aids to the Course of Study," issued monthly in Victoria? Those aids are compiled by a committee of experienced and successful teachers?—I think that would be a great help to inexperienced teachers, but it would be very undesirable to have such a scheme made compulsory. An experienced teacher will work much better under his own scheme than under any scheme prepared by any one else. I get the "Aids" every month, and they are very helpful to an inexperienced teacher.

17. You will notice that very great emphasis has been placed upon phonics and voice-production: what is your opinion upon that?—I quite agree with it. As a matter of fact, in my school we teach reading by means of phonics. It is a system that should be insisted upon in every school.

18. Do you not find that there are great differences between the children in any class from Standard I upwards in regard to reading, some reading with the greatest ease from a book when it is first placed in their hands? Do you not think it desirable that at least one period a week, and probably two, should be devoted to silent reading by those children who are very proficient?—I think more than once or twice a week. My instructions to my teachers are that those pupils whom we know to be capable of carrying out that work satisfactorily are to be given every possible opportunity of reading silently. That sets the teacher free to devote his attention to those who require help. I have practised that for years, and I am well satisfied with the result.

19. What arrangements have you made in the direction of supplying school libraries?—We have a library of 1,700 books, in seven divisions, one for the infant department and one for each standard class, specially selected to meet the requirements of the class, as far as we could get it. Each teacher is in charge of the books belonging to his own room.

20. *Mr. Poland.*] Do you consider that the four Boards of Education that you consider would be sufficient for New Zealand should be elected on the electoral franchise?—Yes.

21. You do not quite agree with the recommendation of the Teachers' Institute that all payments for the cost of education should be made out of the general taxation. You say there should be a liberal subsidy upon local contributions. I suppose you mean contributions for the improvement of schoolgrounds?—I think all contributions should be voluntary. I am at one with the Institute on that point. The Institute objects to compulsory local taxation for educational purposes.

22. The subsidy is merely to encourage voluntary contributions?—As a matter of fact, under the Manual and Technical Schools Act Borough Councils are empowered to levy taxes for technical education. At Whangarei, where I had charge of the technical school, both the Borough Council and the County Council contributed towards the cost of the technical classes. They were allowed by law, though it was not compulsory.

23. *The Chairman.*] Are these the grants that you consider should be supplemented by the State?—I am speaking now specially of voluntary contributions, such as we had at Mount Eden lately.

24. What was it called?—Improvement of the schoolgrounds. We have now £210 available for it, and we have a landscape gardener directing the work. In the course of a few years we hope to have the place laid out almost as a park as regards the portion that can be spared for playground purposes.

25. *Mr. Poland.*] You spoke of the scandalous conditions obtaining at some of the Auckland city schools with regard to play-grounds: how would you overcome a difficulty such as that at Newton East?—I am afraid the only plan is to dip pretty deeply into the public purse, and buy up some of the surrounding shanties, and pull them down. In Auckland we have no municipal trams.

26. We have left the play-ground question too late?—Yes. It is a matter of very great expense, but the thing is worth while. The production of citizens is more important than any other kind of production, and I think the public ought to face it rather than allow children to grow up in such insanitary surroundings.

27. You cannot suggest any way of purchasing land?—If it were near the railway, or we had municipal trams, the children might be moved out, but that is not practicable in Auckland.

28. Are the free school-books a success, in your opinion?—They are a qualified success. When the grant was first given it was not wanted; at least, that is my experience.

29. *The Chairman.*] Do you mean that it was not asked for?—It was neither asked for nor really wanted by the parents in my district, but since so many continuous readers have been supplied, that portion of it is a success. In my own school nearly every child has bought a principal reader in addition to the one supplied by the Department, so that the free book is practically wasted. The children use one book at home and the other at school.

30. Would it be wasted if it could be taken home?—It might be wasted by being lost. Objection is raised by some parents to their children inheriting a dirty book from some one else's children. Some of them have bought arithmetic-books rather than allow the children to use second-hand books.

31. *Mr. Kirk.*] Speaking of the standard libraries, do you find that the children make use of the opportunities provided?—Yes; they use them very freely.

32. And you can speak well of the introduction of such standard libraries as far as other schools are concerned?—Yes. I would recommend them strongly to any school.

33. Is there any danger of these standard books becoming a source of danger, just as the free school-books are or may be?—Not more so than the books in a public library of any other kind. I have never had occasion to suspect the spread of disease from school-books.

34. Do you find that the children handle the books with care, as an elderly person would?—Yes; if they do not they are fined 1d., and they may have to replace the book if it is seriously damaged.

35. From the teachers' point of view, if the charge of a secondary school were placed under the control of the Education Board, would you still be in favour of the retention of the High School Governors?—They might take the position of a School Committee. I think it is advisable to have local control in that way—that of people who would take an interest in the building and such matters, in the same way that a School Committee does. I think the functions of the Committee are very important, so long as they are not allowed to appoint teachers.

36. The secondary schools have that at present, have they not?—Yes.

37. You believe in taking that power out of their hands even so far as secondary schools are concerned?—Yes, if the larger Boards were formed. The smaller the body making the appointment the narrower is likely to be the outlook, and the more room there is for favouritism.

38. It is your opinion that no technical education should be introduced into the primary schools?—That is a thing to be guarded against. Nothing of the kind, as far as I know, exists at present; but there is a danger that misguided people not connected with education might force this thing upon the school. That is what made me speak so strongly against it. For instance, a farmer is apt to expect us to produce a full-blown farmer from the primary schools; the builder thinks that if a boy does good work it is as good as an apprenticeship. That is a phase that I think we must guard against.

39. You spoke of sexual immorality in the schools, and said that it was the result of ignorance rather than vice: now, what does this sexual immorality amount to?—My personal experience has not shown me that there is anything of that kind to any marked extent in our schools. In fact, I have never personally come across a case.

40. But does it exist to a certain extent in the schools?—I am told so, but I cannot say so from personal experience, because, as I have said, I have never known of a case.

41. You do not agree that the teachers should teach sexual physiology?—No. I think it requires an expert, and a very tactful one at that.

42. *The Chairman.*] You would not limit it to one teacher of this subject? There would have to be teachers of both sexes?—The girls would need to receive separate instruction from a qualified woman.

43. *Mr. Kirk.*] A suggestion has been thrown out that the Government might appoint dentists to inspect the children's teeth, and doctors to examine the children, more especially as to their liability to contract consumption: do you think that those persons could have duties cast upon them in this direction?—Not necessarily. They might have the medical and scientific knowledge, but not the necessary tact or skill to approach a boy or girl in the way they ought to be approached on such a delicate subject.

44. Have you any suggestion to offer as to the way of dealing with the matter?—The suggestion made by the Institute is the only one that occurs to me—that the Department should select a suitable man and a suitable woman to pass through all parts of the Dominion and deal with this matter in their respective sexes. It is not necessary that this matter should be constantly before the children. Once in a lifetime might be sufficient for one particular child.

45. Does it not really come to this: that it is the fatherly instinct rather than the teacher's instinct that is required in the person who undertakes such an office?—The fatherly instinct, coupled with a reasonable amount of scientific knowledge.

46. *Mr. Wells.*] This morning's *Herald* devotes the leading article to our education system, in which it states that in the system we are spreading our efforts over too many subjects—that we should concentrate more: what is your opinion on that point?—I do not agree with that. If any teacher does spread his effort out he does it from a wrong conception not only of the syllabus, but of the principles of education. The spirit of the syllabus and the spirit of modern education is that subjects nominally separate should be correlated so that they form one undivided whole. There is no spreading if that is done. I think the Commission might give some special attention to the question of the correlation of the work. Nominally there are a great many subjects in the syllabus, but they are so interrelated that they can be brought together so as to form practically one subject. If that is done, and Inspectors and teachers guard against quantative teaching, there is no spreading out of effort at all.

47. Auckland is the largest education district in the Dominion. Do you, as a representative teacher, know of any drawback resulting from the large size of the district?—Only that mentioned by Mr. Mulgan yesterday—that the Chief Inspector does not know all the teachers; and I do not think that it is a serious drawback. I do not think it is necessary he should know them personally. He has an able staff, and he and they between them know all the teachers, and his skill is sufficient to judge a teacher from the report of his colleagues.

48. The Institute is anxious to see a Dominion promotion scheme in operation: do you think it would be possible to have a Dominion scheme with the present number of Boards?—It might be possible, but it would be far better to reduce the number. The question of Inspectors would come in. There are too many districts with one Inspector in the district.

49. The question of movable pictures has been mentioned as a means of teaching: what is your opinion of the value of the movable picture as against the magic-lantern in the school with an abundant supply of slides?—I am experimenting on that subject now. I have arranged with the owners of a theatre near my school to give a matinee once a month, at which they will show three or four films selected by me some time beforehand, in order that we may give lessons on the subject. We propose to take the children to see these films exhibited after they have a sufficient stock of ideas on the subject. I hope the result will be good, but, of course, the matter is in the experimental stage at present.

50. Have you had any experience of being handicapped in practice through the school growing faster than your assistance?—A great deal of experience. For about nine years I was in schools that were constantly growing, and I can speak very definitely on the subject.

51. That the assistance does not come quickly enough?—Exactly. I will quote some cases from memory, and I do not think I shall be far out. About the beginning of 1904 I took charge of a Whangarei school which had an average attendance of about 121. The staff consisted of one assistant teacher, two pupil-teachers, and myself—four altogether. To get the next assistant under the regulations in force at that time—and they are not very much modified now in that direction—we had to get an attendance of 180 for the quarter—that is, approximately sixty above

what we were staffed for. We kept on growing for a number of years, until in the middle of the year the school reached an attendance of 220. Just before that stage we had been staffed for 151, so that we got to be about seventy ahead of what we were staffed for. At a later stage things were not quite so bad, because the staff was stronger. I was there for six years, and it was not until the last few months that we were fully staffed. Then I came to the Mount Eden School. At the present time we are staffed for 851, and in more than one week we had an average of 958, or 107 above what we are staffed for. Our monthly average for February last was 942, and it dropped only because of an epidemic down to 926, just three below the number required to get another assistant with one quarter's work. Now we will go on for six months, and I am afraid that that epidemic will bring our average just below 920, so we may have to go on for three quarters with this number in excess of what we have staffed for. Those are cases in my own experience.

52. *The Chairman.*] In your own school, do you draw off from neighbouring schools to an appreciable degree?—No. I do not admit any child from outside my own district. In point of fact, I cannot admit all those from the district who apply. Sometimes I have 100 on the list waiting for admission.

53. *Mr. Wells.*] Do you know of any instance of overlapping or duplication in our education system?—There is a certain necessary amount between the technical schools and the high schools. I had charge of the technical school at Whangarei, and it was doing work somewhat similar to what was done in the high school, only that we did it in the evening and they did it in the day-time.

54. You spoke about the power to raise money locally for school purposes: would you be in favour of giving the Committee power to levy a local rate?—Not unless they were elected in a different way from the present method.

55. Do you think it would be possible to improve our play-grounds as part of the town-planning scheme?—Yes. It certainly is an essential part of any good town-planning. I think the play-ground might very well become public park.

56. You spoke of allowing a teacher who was getting beyond his best work on account of age to retire from a school where his duties were heavy and take up lighter work without his superannuation suffering. Take another case—that of a young teacher placed in a rapidly growing district: do you think the Board should have power to remove that teacher if the school increases beyond his deserts?—I do not think any teacher should be removed from a position so long as he is able to do the work efficiently, but the moment he is unfitted to do the work I think he should be removed.

57. Take the case of a young man from the training college who goes to a school of the size twenty-five to thirty. Owing to the increase of settlement the school reaches an attendance of one hundred or more—a school which many an older teacher would be glad to get. Do you think the Board should have power to move that teacher, and advertise the position?—Yes, if the thing were made general. It is a matter that has been under very warm discussion in the Auckland District recently—not in regard to such a case as you state, but in regard to assistants who were in a school before its grade went up and another assistant became appointed. For instance, a certain lady held a position of second assistant in a school when it was in Grade 9. The school got into Grade 10, and she was displaced by a man. She suffered nothing in salary; but it is a question whether by this process she was not virtually transferred from the position of sceond assistant to that of third assistant. Unless the thing were made perfectly general, I would approach that question with very great caution; but if it were understood that a teacher was definitely appointed to a definite position, and that when the conditions changed he was to seek some other sphere suitable to his attainments, I think it would be fair to give the Board the power. My point is that an efficient teacher should be left in his position, and an inefficient teacher should not be tolerated for a moment.

58. *Mr. Pirani.*] In regard to the last question, do you not see that your opinion strikes at the very root of a Dominion system of promotion?—Not necessarily. A Dominion system of promotion does not necessarily mean changing everybody when the grade of a school changes. In other words, a person is appointed only when there is a vacancy.

59. Surely a Dominion system of promotion is based upon the merits of the teachers. Surely, if there is a teacher more fitted to take charge of a certain school than the teacher in it, then under a Dominion system the teacher in it should give place to a better teacher, and should take a lower place?—Within limits. Suppose a man occupies a certain position, and has 75 per cent. of marks for efficiency, I am not prepared to say that as soon as some one is found with 76 per cent. of marks he should replace the 75-per-cent. man.

60. But the case put to you was that of a teacher recently from the training college, who could not possibly have 75 per cent. Yet you say that if the school jumps even from fifty to a thousand, so long as that teacher was efficient, and had marks for efficiency, he should stay?—I did not speak of the marks. I spoke of his being able to carry on the work efficiently for the good of the public.

61. Who is to be the judge?—The Inspector.

62. Would you give the teacher the right to appeal against the Inspector?—I would give every man the right of appeal.

63. To the Appeal Court?—No. I thought you spoke of appeal from the Inspector's marking.

64. I am talking of the appeal against the teacher being transferred to a reduced position because the Inspector did not think he was up to the work?—You should not refuse the theoretical right of appeal to any one, but in a case of that kind it is surely improbable that any one would take up his case for him.

65. You do not know much about the recent history of appeals, or the cost of appeals?—Oh, yes, I do.

66. The question I want you to answer is this: If the Inspectors and the Board consider that that teacher should be transferred to a lower grade of school, would you give that teacher the right of appeal to the Appeal Court?—Not against the Inspector. At least, I, as a member of the Institute, would not be any party to the man appealing if the Inspector thought he was unfit for the position.

67. That is in the case of a transfer?—Either of a dismissal or a transfer. We invariably carry out that practice in Auckland. If a man cannot show that the Inspector's report upon his work is sufficiently good, we do not back his appeal.

68. With regard to the supply of stationery for the schools, do you make any levy upon the pupils?—No. The stationery is paid for out of the Board's grant.

69. Do you think that section (*i*) of clause 55 of the Education Act, where it prevents an assistant in a school being appointed headmaster of the same school, is a proper provision?—He is not prevented from being appointed, he is prevented from being transferred. As I understand the Act, if the position is advertised he has a perfect right to apply for it and to get it.

70. Then, how would he come out under a Dominion promotion list? Would his classification as an assistant put him ahead of the classification of headmaster in another school of somewhat smaller size?—In Auckland head teachers are classified on separate lists. The name of a man who has classified fairly well as head teacher of a country school may have no classification as an assistant. He may be on one list, but not on the other.

71. But some are on both?—Some on both and some on one only.

72. Are any of the assistants classified on the head teacher's list who are not head teachers at present?—Yes.

73. Do you think it desirable that there should be any limitation of the choice in the appointment of a head teacher?—I think any assistant who is qualified ought to be eligible for appointment to any school. In the public interest, the best man available should be appointed.

74. You state that the recent regulations have provided against the reduction of a teacher's salary except in the case of inefficiency: is that so in regard to all teachers?—Within certain limits. For instance, in the case of falling attendance a man's salary cannot be reduced for—I think it is three years.

75. You do not know that that does not apply to all teachers in the one school?—No, I thought it was a general rule.

76. You would be surprised to know that a teacher might lose his position altogether in a school, and be thrown out without anything to do?—That is so, but it is very unusual.

77. Do you not think that, if owing to a reduction in attendance a school goes down in grade, some provision ought to be made for the teacher?—It seems only just. The question is whether the public can afford to pay for teachers who have nothing to do. As a teacher, I would like to see the public pay a pension to any one who lost his position in that way, but as a citizen I do not see how the thing could be done except by transferring that teacher to another school.

78. In regard to decrease of the classification list, or sectional classification list, you said there ought to be some right of appeal. Is there any right of appeal under your system?—Not that I would call an appeal. The person has a right to come to the Board. I do not know how the Board deals with the matter, but there is nothing in our scheme to say that any man has a right to be retried, as it were.

79. Is not the appeal to the Board the same as in Victoria? You appeal to the controlling Board there?—No. In Victoria a meeting of the Committee of Classification is called, and the man's record is fully gone into, and the thing begun *de novo*. I have never known a case where it was done here until the end of the period of two years.

80. With regard to your idea of having four education districts in New Zealand, do you not know that it would be utterly impossible to work Southern Westland in with Taranaki in one education district?—I would not attempt to put it in with Taranaki.

81. But it is with Taranaki in the Middle University district?—Then I am wrong in my idea of the boundaries of that district.

82. Do you think it is possible to get the work of the primary, technical, and secondary schools done by an unpaid Board for each of the four districts?—It is a thing I have not thought about. It would certainly involve a great loss of time to the members of the Board, and they ought to have some recompense.

83. Do you not think that if that happened your idea of a big saving by the abolition of the small clerical staff would amount to nothing?—They would not need to get princely revenues.

84. Neither do the staffs of the small education districts?—The Board must have its Secretary and its office, and I suppose its truant officers. One truant officer does for the whole of Auckland, and one Secretary for the whole of Auckland. A cadet in the office added to the staff of an office like this would be sufficient to do the extra work imposed by the inclusion of the small district.

85. You must remember that in some cases the Inspector and Secretary is one man?—Yes, but only in a few cases.

86. Do you think the Inspectors now are so underworked that they would be unable to do the additional work of the smaller district without increase of staff?—They would simply absorb some of the present Inspectors. One man could do more than inspect the Grey District. I think that there are nearly as many children in my school as in the whole of the Grey District.

87. You talk about abolishing the Inspector's notice visits: do you call that an examination?—Too often it resolves itself into an examination. It is not so much any favour on the part of the Inspector as the overanxiety of the assistants to take all sorts of precautions that they shall not be found weak in any subject. I find it very difficult to restrain my staff from keeping children after hours—for instance, about this time of the year.

88. Is not your idea more applicable to the large schools than to the small ones, where you have a responsible man at the head of the school?—I think it is even more so at the small schools. If a man does not know when an Inspector will appear in his school he is more likely to keep his daily work up to the mark than if he knew he was to be tested at a stated period, and could cramp up to suit the case.

89. Does it not strike you that as soon as an Inspector has visited a school the master may know that he will not be round again for a while, and so he can slacken off?—If I were an Inspector I would not let him get that idea. I would appear again without notice.

90. How many Inspectors would you require for Auckland if they were to turn up occasionally every month?—It would not be necessary to turn up so often as that. The examination of the big schools takes two men. At my own school last year one Inspector was inspecting for not quite four days. Two came a little later, and spent three days. That is ten days of Inspectors' time taken up. A great deal of it was unnecessary, because the two men who spent three days examining found out no more about the school than the one man found in inspecting it. They would have been better in the backblocks helping some teacher who needed assistance. My idea of the Inspector's work is that he should go to the help of teachers in the small schools—be a guide rather than a critic.

91. *The Chairman.*] There should be less inspection and more instruction?—That is my idea.

92. *Mr. Pirani.*] Do you think the majority of the teachers are capable enough to be judges of the work in their own schools?—If they were not capable of doing that I would not let them teach.

93. Then would it not be a good idea to abolish the Inspectors altogether?—No, because the Inspector is a very highly skilled man. A man may be capable of teaching and classifying, and yet not be a man at the head of his profession as an Inspector is.

94. What test would you say an Inspector ought to make as to the efficiency of a school?—A man who knows his business would in a very short time satisfy himself after he had seen the teacher at work, observed the tone of the school, and seen the work done in the copy-books and exercise-books. I would undertake to form a fairly sound judgment upon a teacher without examining any of his pupils.

95. Do not the regulations allow that now?—Yes, but they are not always carried out.

96. Then, you complain of the interpretation of the regulations rather than the regulations themselves?—Nine-tenths of the criticism of the syllabus should be levelled at the interpretation of the syllabus.

97. In regard to the election of these new educational bodies, does it not strike you that you want to put the power into the hands of the residents in the cities? Take Auckland for instance?—We have wards. It would be absurd to have people at Lake Taupo voting for a man who lived at the North Cape.

98. Then, you would not elect the Board on the popular basis?—Yes, but for wards. Members of Parliament are elected on the popular basis, but the whole Dominion does not elect any one man.

99. They are elected on a popular basis, but there is a handicap against the cities of 28 per cent.?—There is no reason why that should not apply to these elections; I said on a popular basis, not a population basis—on a democratic basis, if you like to put it that way.

100. *Mr. Kirk.*] Is it possible in New Zealand for any teacher to be reduced in salary or to lose his position in a school?—Quite possible. That is the case Mr. Pirani was quoting.

101. Even in view of the great outcry there is for teachers?—In view of the present circumstances, it is practically impossible for a competent person to be unemployed, but supposing the supply were to be in excess of the demand it would be possible.

102. But that does not exist at the present time?—No.

103. *The Chairman.*] Is there any means by which a Board can dispose of this man's services?—I do not know of any case that has come under my notice in Auckland where a man has been out of a place. Our Board has been very paternal in this respect, and generally finds such a man a position as relieving teacher.

104. But he relieves only until a proper position is found for him?—Just so.

105. *Mr. Hogben.*] You speak of twelve or thirteen subjects being required for the first section of the D examination?—I said there were about fourteen in the whole examination, and about twelve in the first section. I speak subject to correction. I have not counted them carefully.

106. Take English language, composition, history, and civics: would you call those four subjects as they are classified here?—Yes, they require separate study, and in the case of a pupil-teacher who is tired after his day's work it is a serious business to undertake that study.

107. Drawing used to be called one subject. It is now three, for the sake of division: would you reckon those as three subjects?—I did in speaking of them.

108. Have you considered the question of graded desks instead of adjustable desks?—The difficulty is to know the exact proportion required. It is difficult to say how many children you have of a given size. With that proviso graded desks would be very well. We have them here to some extent, as a matter of fact.

109. You said in one portion of your evidence that with a staff for 151 you had to go on with a range of seventy: is it quite correct to call that the staff for 151? Was it not the staff for the number from 151 to 200?—Yes.

110. Could you not equally well say it was staffed for 200 in all grades?—When you are near the top of a grade the classes are very difficult to manage. They are unwieldy.

111. But did not 151 rather overstate it. Was it not well staffed for the minimum attendance?—I quoted the minimum in each case.

112. Would it not be fairer to call it a staff for 175—half-way between the two?—That would be fairer; it would leave a good margin.

EUPHEMIA SIMPSON examined on oath. (No. 5.)

1. *The Chairman.*] What are your position and qualifications?—I hold a C1 certificate, and I am in charge of Standard IV in the Newton East School, Auckland. I am President of the Women's Branch of the Auckland District Educational Institute, and I speak on behalf of the lady teachers in the primary schools. The Women's Branch of the Auckland District Educational Institute desires to ask this Commission to consider the question of improving the status of women in our schools. We are, and have been for some time, in communication with representative women in other districts, and there is no doubt whatever that a very deep and growing feeling of unrest and dissatisfaction prevails among the women in the education service throughout New Zealand—the southern women are indeed preparing a petition to Government on the subject—but particularly in Auckland and Otago, where the local Boards have persistently refused to admit the claims of women to any of the higher assistantships in schools of Grades 9 and 10, and have practically excluded them from the charge of schools of Grade 4. It is hardly necessary to point out that the widespread existence of deep discontent occasioned by these inequalities must militate against the efficiency of a large body of teachers—no group of men or women can do the best work while smarting under a keen sense of injustice. It is against human nature to expect it, and our schools must suffer as long as this feeling exists. It is not suggested that the work of the women in the schools is inferior to that of the men. They are required to take the same certificate and to work the same number of hours in any part of the school that the headmaster chooses, and yet, in spite of their ability and faithful service, able and experienced women have to suffer the humiliation of seeing young and comparatively incompetent men placed in positions above them, to the serious detriment of the schools for which they have worked so hard. The injustice does not cease when they retire, for they do so on a pension much less than that of the men who have only done equal work with them throughout their teaching career. Some of our women are leaving the service to take up other work, and, owing to the prevailing unrest and dissatisfaction, there is not the slightest doubt that others will do the same. It is becoming increasingly difficult to get teachers. A few years ago our local Board advertised in the daily papers requesting married women teachers to re-enter the service. The position has evidently not improved at all, for married teachers who have been out of the Board's employment for years have quite recently been invited to take up the work again, and uncertificated teachers have been sent to many schools, simply because no others were available. It is growing more and more difficult to recruit the ranks from girls of the right type, for the finest girls of to-day are not going to enter a profession where, no matter how talented they may be, they see nothing ahead but a hopeless blind alley as far as promotion is concerned. If they are to be kept in subordinate positions they prefer some less arduous occupation—one that does not make so many demands upon them, or entail so much self-sacrifice and brain-weariness. And, besides, there are other fields of industry where women of outstanding ability may earn very much more than they can ever hope to do at teaching, so that the inducements to enter this profession are becoming less and less. Then, again, owing to the fact that all the highest positions are held by men, the girls' side of the schools is becoming more and more neglected, and surely their training is at least as important as that of the boys. In some of our largest schools the Fifth and Sixth girls are taught entirely by men, while in most the Sixth class is in charge of a man. It can hardly be expected that many of the underpaid junior woman assistants will in the future qualify themselves to do such important and difficult work when they know it will bring no corresponding increase of salary; and yet the Sixth girls in every school should be under the constant charge and supervision of a competent woman. They are just entering into womanhood, and, from the very nature of things, no man is capable of controlling and directing their energies as wisely as a woman can. He can teach them square root and the use of the globes, but he can never have that sympathetic understanding of them which is such a vital factor in their education. It sounds incredible, I know, but there are men who actually cane the senior girls—not many, but some. It is a good thing I believe for men to take these girls' classes at regular intervals, for the man's influence helps to round out their character in other directions; they are the better for both influences, but the woman's should predominate, and under the present system it is almost completely absent. Again, as long as all the responsible positions in the schools are held by men, it seems obvious that the domestic training of girls can never take the important place it should occupy in our educational system. This matter vitally affects the general efficiency of our schools, for no system of education can be called efficient that has not some more or less direct bearing on the future career of the children. For all these reasons we consider that the efficiency of our education system would be greatly increased by giving women more responsible positions than they hold in our schools at the present time—that the principal woman assistant in the higher-grade schools should hold at least equal rank at equal salary with the second male assistant.

2. *Mr. Davidson.*] Have you ever considered the advisability of classifying male and female teachers separately, as is done in many other countries?—They are graded separately in Auckland.

3. I am not speaking of Auckland particularly, but a general grading for the whole Dominion?—You mean by that that the schools would ultimately become separated into boys' and girls' schools.

4. No, if you look at the scale of staffing and salaries you will find no distinction of sex whatever exists there?—That is so.

5. We will take the Victorian system. Under the scale of staffing and under the scale of salaries there is a separate classification of the sexes, and the positions and salaries of the first male assistant and first female assistant can be readily compared. Would it not be in the interests of the women if they could compare the salaries under such a system as that?—I do not exactly understand what you mean. The women in Victoria are not satisfied. They are agitating over

there—I have a paper from one of them—for equal pay for equal work, and that women should be eligible for all positions in the service as well as men in our mixed schools, unless you separate the boys from the girls.

6. It is not a question of separating the classes in schools; it is simply a question of classifying the male and female teachers so far as salaries are concerned. I will take such a school as Mr. McKenzie represents. The first female assistant in such a school in Victoria receives a much larger salary than the first female assistant in that school in New Zealand. She occupies in Mr. McKenzie's school, I take it, the position of third assistant?—Yes.

7. Well, instead of being third assistant, if you had separate classification she would be styled first female assistant, and her salary would be very much better. Under such a system would you not then be able to state your case more readily, and let the public see the position more easily?—It is a subject I have given no thought to; I will have to think it over.

8. If you were in a school of over 600 in average attendance, would you prefer to be called first female assistant or third assistant?—I would not care very much what I was called, so long as I received a salary proportionate to the position and proportionate to the work I was called upon to perform.

9. If there was a separate classification, and you were first female assistant, and received a salary at least equal to the second man, you would be satisfied?—That is all we ask for at present—simply that we should receive a salary equal to the second man. Of course, what we might do in the future, or what we wish in the future, is another matter.

10. If the scale of salaries in New Zealand were altered in such a way as to give the first female assistant a salary equal to that received by the second male, would you be satisfied?—Yes, for the present. That is all we are asking.

11. You said something about the question of superannuation. I suppose you know that women may retire after thirty years' service?—Yes.

12. And are you aware that women have retired already at the age of forty-two?—I did not know of any case at the age of forty-two. I have heard of several at the age of forty-five.

13. Would you be surprised to know that at least one lady has retired on half her salary at the age of forty-two?—That will be a very exceptional case, I think.

14. That is exceptional, but it is not at all an unusual thing to have begun teaching at the age of fifteen or sixteen as pupil-teachers, and all these women may retire at the age of forty-five or forty-six. Do you not see, then, that women are placed in a very advantageous position in regard to superannuation as compared with men?—Yes, they are; but, of course, if a woman retired after thirty years' service she retires on thirty sixtieths of her salary, and when a man goes on he retires on forty sixtieths. Again, the women have had very small salaries, and the pensions are relatively very small. Of course, it may be half her salary, but her salary was very small to begin with.

15. We will suppose that a woman has reached the highest salary that can be reached in Otago, taking the district that you have specified as excluding women from the position of second assistant—women in Otago may receive a salary of £210 per annum, and taking a particular case I have in my mind at the present time, we will suppose she started at fifteen years of age. By the time she is fifty she will have served for thirty-five years, and she will then retire on thirty-five sixtieths of £210, which is a very fair annuity indeed. No man can retire until at least ten years later. Is that not so?—Five years later. The minimum retiring age is sixty, or after forty years' service.

16. So that a woman may receive an annuity ten years before a man, and, of course, a man has a much shorter period in which to enjoy his annuity?—Yes. The women certainly have an advantage in the superannuation, but I think if we were placed on exactly the same footing in regard to salaries we would not mind being placed on the same footing in regard to superannuation.

17. Do you think it is a question of what the women prefer, or is it a question of what is best in the interests of the children?—You think women are incapacitated sooner than men?

18. Do you not know that educational authorities consider that when a woman has reached the age of fifty-five, and probably has taught for forty years, it would be in the interests of education that she should retire?—I think it depends altogether on the woman. The Chief Superintendent of Schools of Chicago is a woman, and she was appointed to that position when over the age of sixty years, at a salary of $10,000 a year.

19. That is an exceptional case?—It is exceptional.

20. Coming back to this question of assistants, what women really ask for is not that the position of second assistant in a school should be closed against women, but simply that the first woman on the staff should receive a salary equal to the second man?—That is what they have asked for. They have no desire to curtail the salaries of the men in the slightest. All they want is to secure fair and reasonable salaries for themselves.

21. Then you refer to the exclusion of women from schools of Grade 4: can you give a specific case?—I can only quote the figures. In schools of Grade 4 in Auckland only seven women have been appointed, and I could not find one in Otago, so I say they are practically excluded.

22. Do you know of any women in Otago who had been teaching for, say, twenty-five years in a third-grade school, and who, because that school increased to over thirty-six in average attendance, was practically dismissed from the service?—I knew of that case; it was mentioned at the Timaru Conference.

23. Do you know her classification?—She was a degree woman, I believe.

24. I understand that what you desire is that in schools of Grade 4 the head-teachership should be open to all competent women?—I think so.

25. Would you carry that further? Suppose a school of Grade 4 rose to Grade 5, would you allow her to remain?—I see no reason why she should not.

26. To carry that to a logical conclusion, it does not matter what size that school grew to, you think she should still remain as head teacher?—I think so. I do not see any reason why women should be excluded from any position at all in the service.

27. What about the control of the boys in our schools, and military drill?—At present, as far as military drill is concerned, if the men drill the boys the women give physical drill to the girls, and they also take an extra subject in sewing, which men cannot take, and that goes against the cadet work which the men do. I think in a school of that kind a junior male teacher should be quite competent to take the cadet work just as a junior female teacher will take sewing.

28. In Mr. McKenzie's school there is an average attendance of 926: do you think that a woman should have the right to be head teacher of that school?—I see no reason whatever why a very competent woman should not have it.

29. *Mr. Thomson.*] Do you know of any reason why the Boards in Otago and Auckland exclude female teachers from the position of second assistant in schools of Grades 9 and 10?—One reason that has been offered to us is that we cannot take cadet work.

30. That is the only reason you are aware of?—I do not know of any other reason that has been brought forward.

31. You never heard it advanced that a woman could not carry on a school as efficiently as a male teacher?—I have not heard it from the Board as an official announcement.

32. You do not know whether these Boards have ever expressed that opinion?—I have not been in a position to know what opinion the Board has on that matter. Of course, the Board is entirely composed of men, and they would be apt to have one-sided opinions.

33. You consider a female teacher is equally as capable as a male teacher of conducting any class of school in primary work?—I think so. In American schools I think a good deal of that is done by women, and we have one notable instance where a woman has done that. I will take the Mount Eden School. A woman there is in charge of a very large department of over three hundred children, and she organizes and manages that department with perfect satisfaction. If that number were doubled or trebled, I do not see why she should not do it as well. Of course, the women in New Zealand do not get the opportunity to try to manage these big schools, so I cannot give you any certain information as to whether they could or could not do so, but I see no reason whatever why they should not be capable of it. Sometimes we are asked how we would deal with the big boys in case of difficulty. Well, my experience has been that big boys are easier to manage than girls. I find that with tact and discretion you can go a long way, and many women manage them admirably. There is only one last resort women cannot take, and that is the cane, and if the final ground of preference between men and women is the ability to use the cane, then the best way to obviate the difficulty would be to have well-regulated whipping-machines in the schools.

34. Do you think it would improve matters if women were eligible for seats on the Board?—I think they are eligible now, but it would improve matters considerably if they had seats on the Board.

35. *Mr. Kirk.*] Is there a real danger of the lady teachers resigning from the service if this scale of salaries is not revised?—I think so. We compiled a list—I have not got it with me—of women who have resigned during the last few years, and taken up other occupations. Some of them were very good teachers indeed. They did not resign to be married, but to take up other work.

36. Do you know the nature of the other work?—Yes; I know in two cases the women have gone into journalism, and in another case I think the woman is a typiste, but whether her salary has increased or not I cannot say; but she probably prefers a low salary there to the low salary in teaching, where the work is so very arduous.

37. You do not think it is to some extent matter of preference of employment, and that now these other avenues are open it is merely preference of employment that has taken the ladies in these directions?—Of course, there may be something in that. In days gone by there was only one respectable occupation for women, and that was teaching. Nowadays there are many.

38. Do you think that the increasing status would be the desideratum after all?—It would largely tend to keep women in the profession. Dissatisfaction is rife throughout the whole of the Dominion now. We are in a position to know. The women are actually getting up a petition on the subject.

39. Apart from your evidence-in-chief, can you help us so far as your observations are concerned as to any improvements in the methods of teaching, or as to any improvements in the educational system from a woman's point of view?—Yes, we have recommendations to make, but another member of the executive is going to speak about them; she is prepared to answer any question on that topic.

40. *Mr. Wells.*] Did I understand you to say that the girls now coming forward are not equal to those who came forward in the past?—I did not positively say they were not, but I think it is more difficult to induce girls of that type to do so. I am speaking from personal experience, because I have tried to get two or three girls of my acquaintance to enter the profession, but they are all looking ahead, and they are looking so far ahead that they do not like it.

41. You are aware, I suppose, that a far greater number of girls offer than boys?—Yes, I know there are. You will always get women in your schools; there is absolutely no doubt about that.

42. You know it is a difficult matter to get a supply of males?—I know it is difficult to get either.

43. And you also know the Legislature actually protects women, inasmuch as it says that there must be a certain number—that at least one of the first three assistants shall be a woman?—I do not think that is meant to protect the interests of the women; I think it is to protect the interests of the Boards.

44. There is absolutely nothing to protect women holding any position?—Nothing except the practice of the local Boards.

45. Are women prepared to have the whole thing thrown open to competition, and allow the question of efficiency and the welfare of the school to be the determining factor?—We have been satisfied with that so long, and you see the result. You see the case I quoted a little while ago, where a woman, according to the Board's own reading, was more competent than the man, and yet she did not get it. We feel now that there must be some security.

46. I do not know whether you remember the case of a woman in charge of a school in town who took charge when the school was quite small, and remained in charge while it grew, until there were between two and three hundred in attendance, and then the residents petitioned for a male teacher?—Yes, but do the people always understand this thing?

47. Do you know that the discipline was so bad that the residents petitioned for a male teacher?—I cannot understand that, because I taught as a pupil-teacher with that lady, and she was an extremely competent woman, and quite capable of managing her school whilst I was there.

48. You referred to the question of the Boards being composed of men. You do not mean to insinuate that a Board composed of men will not give justice to a woman?—I do not mean to insinuate anything. I only mean to state the plain fact that they have not done so.

49. But have they not to consider the question of the efficiency and welfare of the school, apart from sex altogether?—They may think they are doing so, but I think the question of efficiency has not been considered by them, or they would give women better positions.

50. You referred to America, and the positions women hold there, but do you also consider that in some of the American States as much as 90 per cent. of the teaching profession consists of women, and there is no choice of men for these positions?—Well, the American system of education is supposed to be a very good one.

51. Except that it does not offer any inducements to men?—Well, the schools seem to be run very well by the women; the education there seems to be pretty efficient.

52. But the salaries offered are so low that men will not enter the teaching profession there?—It does not seem to have lowered to such a terrible degree the efficiency of the schools there. Of course I think there should be both.

53. I suppose you would admit that more men go into the teaching profession to make a life work of it than women?—Yes.

54. Do you not think that should be taken into consideration?—I do not think that has any real bearing on the question—that because some women leave the profession those who choose to remain in it are penalized. A fairly large number of men give up teaching for other work, and yet we never hear the question raised of penalizing those who remain in the profession to the slightest degree, and if these women do marry and go out of the service the State is really not losing them, because each one sets up a little home school, and that is best of all.

55. You mean when a trained woman teacher marries, her work is still going on for the benefit of the whole State?—Yes.

56. You mention the question of sewing and drill: have you also considered the fact that outside the teaching of drill, which may fairly be set against the teaching of sewing as special subjects for men and women, there comes in the question of outside parades, and the claims the cadet work makes on men outside the ordinary school-work that is required of women?—I have thought of that, and made a calculation about it. If I am wrong you will correct me. I have calculated that these men cannot actually take, outside school hours, more than twenty-four hours' extra work in the year when the women are at home. If you calculate a man at £250 a year his time is worth 4s. an hour, and even if you double that it will be 8s. an hour. Well, a bonus of £10 per year for extra cadet work will amply cover all the work he does.

57. You are assuming that it does not take more than twenty-four hours, and you are perhaps losing sight of the fact that he has to give up holidays?—These holidays are often special holidays. I think they had a parade for General Godley, and that was not one of the usual holidays. I think the women are perfectly willing to give up these holidays as well, and take the girls for first-aid work on them. The women do not ask for these holidays.

58. Do you not think that the one question is the efficiency of the school, and that it does not matter whether the teacher is really a man or woman?—That is the question, and we contend the efficiency is being interfered with by the absence of women from these high positions.

59. You would be quite content to see all positions thrown open to applicants so long as you are sure all would be fairly treated?—Yes.

60. *Mr Pirani.*] In regard to Education Boards, are you aware there have been Education Boards in the Dominion with women on them?—I was not aware of it

61. There was one in Taranaki and one at Hawke's Bay, and I believe there was one in Canterbury at one time. Do you know if the condition of women in Taranaki and Hawke's Bay is any better than in Auckland?—One woman on a Board would not be likely to have much influence.

62. It depends on the woman. I believe you know that one man often runs the whole Board?—When it came to a vote one woman would only have one vote on the subject, and she would not be able to do much. I think there have not been enough women on the Boards to counterbalance the prejudice of the men.

63. Do you know if any woman has stood for the Education Board in the Auckland District and has been rejected?—No; but I could quite imagine they would be rejected.

64. Do you not think it would be a good idea if your association put forward a candidate or two, and showed the metal of the women, because your complaint seems to be not against the Department, but purely against the administration of the Boards?—Yes, largely.

65. Has your association done anything to counterbalance the bad effect of having men on the Boards?—Our association has only been in existence a very short time, and we have not done anything in that respect as yet.

66. Is it not a matter of fact that of late years the position of women in the educational system has vastly improved?—Yes, but only relatively. It is improved on what it used to be, but not in comparison with the position of men.

67. Is not the salary women get nowadays very much better than it was twenty years ago?—Yes, but by reason of the increased cost of living the extra salary is relatively small.

68. The cost of living depends on the individual: some people are content to live on 6d. a day?—Women do not want to be the ones to be content to live on 6d. a day.

69. Do you not think it would be a very much fairer thing to classify the men and women in the same classification scheme, and let them take their chance for promotion?—The Auckland Educational Institute approached the Board requesting that that be done—that all teachers be put on one graded list and all positions thrown open. That has not been accorded, and I do not think our Board, from what I understood at the time, is in favour of it.

70. Do you know whether there is any reluctance on the part of the women to take sole charge of schools?—Some women would not feel themselves competent to do so, but a great number of women would feel themselves competent. Some of the men are not competent to do it.

71. But the men do it if they are told?—The fact of the matter is that women never have a chance to do these things in Auckland and Otago.

72. In regard to women going out from teaching to other occupations, are they young teachers, or teachers who have been years in the service?—The cases I have in my mind were women of a little over twenty years' experience—some may be less.

73. And do you think, as a typiste, that a woman would get anything like what she gets in a school after twenty years' experience?—Possibly not, but then she would not have anything like the arduous work.

74. Do you not think she would have longer hours?—Longer hours do not matter so very much. We have long hours. We do not work just five hours a day, because we have a good deal of work outside the actual school hours. Some women would rather take less salary and take less arduous work if they cannot hope to have these good positions.

75. Do you not think that the question of study and examinations has something to do with the women leaving the service—that they would prefer not to face that?—I do not think so. I think women are just as hard working in the matter of examination-work as the men, but women have found for so many years that it is no use qualifying, as it did not bring them any advantage.

76. The women in the Auckland District?—And in Otago; and these are two of the biggest districts; and even in Canterbury.

77. Do you think that a reduction in the size of the districts might favour the claims of women, then?—I have not considered the question, but the small districts are proportionately just as bad. In Wanganui no woman holds that position.

78. Do you know we have four women teaching fourth-grade schools in our small district?—That is at a salary of £190.

79. Do you know we have two women in other schools getting £260 and house-allowance? Do you think your association would be satisfied with such a promotion list as we have—that is, that the women and men should be put on an equal footing in the promotion list, and should get an equal chance to have an appointment, from the headmaster right downwards?—I do not think we can give up our present position for that, because we have been so long kept out of these positions that we have no confidence in the Boards to give them.

80. What is being advocated is a Dominion system of promotion for the whole of New Zealand, and on that list every teacher would be classified according to that teacher's attainments and efficiency. If there was a Dominion system, do you think your association would be satisfied to be put on an equal footing in all respects with men in regard to promotion and salary?—That requires thought. I think we would like first to have women Inspectors as well as men Inspectors.

81. We have teachers here who practically advocate the abolition of Inspectors?—If there are to be Inspectors at all, let there be women Inspectors as well as men.

82. Before you would be prepared to go on a promotion list on on equality with men you think there should be women Inspectors?—Yes, to safeguard our interests. Of course, I am speaking personally. That is a question that has not been discussed by the association.

83. How are the women teachers in this district satisfied with their positions on the promotion list—with the estimate of their ability?—That is a question I cannot answer. Our positions are not known on the graded list. We know what marks are awarded.

84. Have you ever heard any dissatisfaction expressed with the maximum marks awarded to women by Inspectors?—No, I cannot say I have, but I think if people were graded low and were dissatisfied with their markings they would not be likely to speak about the matter.

85. Would they not have the right to appeal?—They have the right to appeal, but they would not care to have the matter generally known. I know one lady who is exceedingly dissatisfied with her marks, but she would not let it be known except to a few intimate friends who were not supposed to tell anybody. That is the only case I can give you from personal knowledge.

86. So you have no absolute reason to be dissatisfied with the marking by the Inspectors on the promotion list except that theoretically you think a man would not be fair to women?—We are only judging by past experience. In the particular case I have mentioned the woman was

graded higher on her list than the man on his list, and yet the man got the position, while the woman whose headmaster speaks of her in these eulogistic terms was debarred from applying for the position because of the terms of the advertisement.

87. But on an ideal list there would be no such thing as an application; they would take the list as it stood and award promotion from that list: do you not think that would be a fair system?—Yes, it would be fair if the sexes were represented equally on the Inspectorate, or the body who assessed the marks. In the meantime we want something practical.

88. *Mr. Hogben.*] Will you look at the salary of Grade 9A. The first assistant has a salary of Grade 6—namely, £240 to £270; and the second assistant has a salary of Grade 4—namely, £180 to £210; and the third assistant has a salary of Grade 3—namely, £150 to £180: is the effect of your proposal to substitute a salary of £180 to £210 instead of the salary of £150 to £180?—That is it.

89. Now, I will ask you in regard to a little practical difficulty, but a difficulty all the same. Supposing you had a Board that would sufficiently recognize the merits of deserving women to appoint a woman first assistant: would you in a case like that raise the salary of the two men whom we will assume to be in the second and third positions before?—I do not know really. Why should we not take the salary as it is and let the men come next in order? Suppose a woman is appointed first assistant, why should not a man be appointed second assistant, and take second place, and not change the salary at all?

90. Then, if a woman got a third position, you would give her a salary of Grade 4—namely, £180 to £210; but you would have to make a proviso that a man only got a salary of £150 to £180: is not that what it would come to?—There are actual difficulties in the way.

91. Have you thought of that difficulty?—No, I have not thought of it. There are dual positions in the school. There is a dual position lower down.

92. Would you get over the difficulty by making the second and third salaries the same in all cases?—Yes; then there would be fifty-five positions involved if we did that, because in some of these cases a man would have to come up and in some the woman would have to come up. There are some men now holding second-assistantships in these schools. For instance, in Canterbury there are a number of men holding third-assistantships, and if we bring these up there are, according to my counting, fifty-five positions involved.

93. In a Dominion scale you would bring up that third position everywhere, would you not?—It would have to be.

94. Would you alter it by changing the schedule?—I think I would leave that to the experts. I have really no practical suggestion to offer. We only simply ask for the measure to be done. We have not thought as to how it should be done.

95. *Mr. Davidson.*] Have you any idea as to the number of women teachers retiring before the age of forty or forty-two, we will say?—No, I have not the statistics.

96. Then you do not know that 81 per cent. of the women retire from the teaching service—mainly, of course, to be married—before reaching the age of forty-two?—I did not know the percentage. I knew there was a very large number.

97. That means only nineteen of every hundred women trained by the State remain any considerable length of time in the service?—They go out into the service in another way.

98. *The Chairman.*] On economic grounds, is it not a fair position to take up that a woman who goes out of the service as a well-trained teacher, becomes a mother, and fulfils her duties in the household has done the State quite as much service as a man who goes out into the world from the teaching profession into other walks of life?—That was my contention.

99. You complained just now that the women do not get that amount of representation on Boards or Committees that their potential interests entitle them to, in your judgment. Supposing it was a fact, as has been suggested, that additional responsibility should be put upon Education Boards to control the education not only of primary schools, but of secondary and technical schools, would you favour any proposition by which women under an altered franchise could become eligible for seats thereon, or would you adopt what is known in other countries as the co-option principle, by which women, without having to go through the fatigue, &c., of an election, can, by reason of their attainments and knowledge of the theory and practice of education, find seats on these Boards?—I would certainly favour that system.

100. Your contention is that if a woman be capable of efficient teaching in any grade of a public school she should be entitled to the salary attached to that position, irrespective of sex?—Yes.

MARGARET SLINGSBY NEWMAN examined on oath. (No. 6.)

1. *The Chairman.*] What are your qualifications?—I am a teacher in the Normal School. I have a D certificate.

2. How long have you been employed teaching there?—Six years.

3. I understand you appear before the Commission as a representative of the women teachers in this provincial district?—Yes. I have three matters to speak about. I think I shall speak about kindergarten first. I do not think I need advocate the kindergarten. I think it is recognized even in New Zealand. It is supported by the Government, and acknowledged by them in one sense. What I am here to suggest is that the kindergarten be incorporated with the public system of education. The kindergarten has always been rather a separate thing. That probably is because of the manner of its inauguration, but in most countries it has been found advisable to place it in its logical position as part of the educational system of the country. I will give my reasons for this. First, because the kindergarten has had a greater influence in reshaping educational ideals than almost anything else. Its theory is accepted and practised in every department of education, but it cannot be effective unless the teachers of the kinder-

garten have the right understanding of their work. This is a very big question, because many people undertake the teaching of kindergartens who are not properly trained for the work. The responsibility ought to rest, and can only rest, with those who have control of them. Nothing has done more harm, not only in the kindergarten in Auckland but in other places, than to have falsely called kindergartens. In Victoria a free kindergarten association was established, and a kindergarten was also established in connection with the training college, and the free kindergarten finally gave up its functions to the Government, because they found that the work could be done better by the Government authorities. The problem is not the only one we have. In every country where they have had kindergartens the fact that kindergartens falsely so called have been established has not only exercised a bad influence, but has given a false impression of the kindergarten. Another reason is that the kindergarten forms the link between the home and school life. We all know that the life of the child at the school has hitherto been separated from the life of the child at home. Also, the kindergarten has a great influence on the home. It tends to create higher standards and make the parents feel their responsibility more. Some people say it takes the responsibility from the parents by taking the children away at an earlier age, but in practice that is not so. The influence of the kindergarten is just in the other direction. The parents find the children can be trained in different ways, and they find that it makes a great difference to them. Now, the children of the towns have kindergartens, but they have them as a charity, and I think they should have them as their right, and not as a charity. I might say I asked the head of the kindergarten in Auckland what she thought about it—whether she thought it would be better—and she said decidedly it would be very much better to work in an organized way under the Government. Again, people always talk about the expense of things. Training colleges are already equipped to train kindergarteners, and should easily do the work, so that there need be no trouble in that way. Another matter I would like to bring forward is about schools for children whose development is not normal. Of course, this does not refer to children whose development is such that they will never be able to take part in social life. Proper schools are provided for them. The schools I mean are those for children whose development is such that if they were attended to they could do some work and become somewhat socially efficient. In every large school there are many children of this type. Besides retarding the progress of other children they themselves must be very much discouraged: they must lose hope, and also self-respect. Again, children of this type are very often so pitied that they are spoilt. People do not expect them to put forth any effort or to do anything for themselves, so really while they are perhaps especially cared for they are made less efficient than they might be, and what has been done in kindness to them really hinders their advancement. Many teachers have these children in their schools, and they feel sure that if special schools were established with the object of helping these children to a better development, and perhaps drafting them into the ordinary schools later on, they could give them special training to make them efficient. Of course, a school like that would have to be very carefully named, because if this were not done it might constitute a reproach later on to these children. The teacher, of course, would have to be specially trained in special courses of study. Emphasis would be laid on manual arts. In speaking of this I am thinking of something like the open-air schools they have in London. Of course, the cost would be considerable, but the money would be well spent, and it would be spent in forming instead of reforming. At present we know very little of what happens to these children after they leave the school, but we know from what they are like when they leave school that they must become members of society that hinder instead of helping progress. Perhaps the most important thing I have to speak about is the training of girls in domestic work. I need not labour the question as to the necessity for this. I heard somebody say that it was almost impossible to overestimate the difference it would make in the efficiency of a nation if its women were trained in the scientific principles that underlie the daily tasks of the house. There was a theory that young girls should be given a good general education, and that common-sense would teach them the rest; but this has been wholly disproved. We forget sometimes in thinking of the girls' education that the schools were really established for boys only in the beginning. Girls were not admitted very much, and then when it was realized that girls had to be educated they were sent to the schools whose curriculum had been established for boys. That is a broad statement, and practically what was done. Many efforts have been made to readjust boys' education to suit new social adjustments, but very little has been done to help the girls. The first effort to grapple with this problem was made through the kindergarten schools established for training girls. If we say the girls are to be trained, the question arises for us, does part of the training belong to the primary school. I think it does. All life, but especially domestic life, demands resource in meeting situations and dealing with problems, and you cannot learn this in a three-months continuation course—in a short laundry course or cooking course. It must be a habit of life and the result of training. If you watch a class at work in any school—say, Standard III or Standard II—you will see that at the end of the day very little has been done to help the children in this direction. They have had plenty of training in docility and obedience in carrying out the teacher's will and wishes, but there has been no initiative to meet and solve problems. It is quite a common thing for teachers to say that the best-trained children are the monitors, and many teachers I know try to have as many children as possible in their class monitors, so as to give them the benefit of this kind of training. Then, a less demand was made on girls formerly than now by school life. Now girls are obliged to go to school and do a great deal of work, and they have very little chance of learning anything at home, so their home training gives them very little of this work. Another thing is that the girl's estimate of this work will be that of her school. In other branches of science, such as engineering, efforts were made to give these branches in the Universities such an honour that degrees could be conferred, and it is in the same sense that I refer to the girls' work at school—they should be given a sense of the dignity of housework. It should be considered

quite something worth doing, and unless we have that attitude encouraged at school I am afraid they will not get it afterwards. Whatever our school life does, it gives our pupils a tendency in certain directions, and if the tendency be not in the direction of any work of that kind we cannot make it up to the girls afterwards. If you think for a moment of the school life of a girl you will realize how little she hears about the textures of material, about food and mixtures, and about the implements in common use in the home. There are occasional references to these, but no systematic reference. I hold that housewifery of any description can only be learned by doing. It cannot be learned by any other means. No teacher standing up and wisely talking to the girls can help them much in this direction, and so it must be a taught subject. Then, again, the home is utterly divorced from the school at present. I hold that a child who really belongs to both should work in the closest connection with both, and I can see no way in which a child can work in this close connection except in this way. There are three fundamental principles of education as we know it to-day—namely, the conditions of health, social efficiency—that is the first consideration and almost includes the other—and intellectual efficiency. These three things must be considered. I think our syllabus allows scope for a good deal of training in these three departments, but I cannot help feeling that the teacher's work in this direction is almost wholly measured by the examination that finishes the school course. The teachers say they cannot take account of these other things because they have not the time. The teacher feels that the examination at the close of the school has nothing to do with the health of the pupils; has nothing to do with the social efficiency of the pupils; takes nothing into consideration but the mental ability of the pupils. Now, if the children's mental ability is made the sole criterion of success in school, then the teachers must give that direction to their work whatever syllabus they have. I am not going to condemn examinations *per se;* they have their right place, but I am showing their influence on the education of girls in our school. The only special work girls have is sewing, and that part of the syllabus is arranged with less reference to the educational ideals of the present day than any other part. The girls do some work in cooking and laundry, but it is dissociated with school life. They have to go away for it, and they have a different teacher, and it is set apart in their minds. The girls are very interested in cooking. The reason girls like cooking and sewing is that they have a chance for once to do something. That is the side of education that is neglected. I think that everywhere but in New Zealand an attempt has been made to give this training in schools. While it is so necessary in the primary schools I think it should be taken up also in the secondary schools. The secondary schools are in more danger of becoming places where girls are given a store of information and crammed than in the primary schools, and therefore it is more important that this side of the girl's education should be attended to. In thinking how this subject could be dealt with I started with the kindergartens. In the kindergarten the connection with the home is very strong. The children are taught to do little home duties, and if that attitude of sympathy with the home could be kept up through the schools it would mean a great deal of difference in the efficiency of the girls. In the lower classes, such as Standards I, II, and III, sewing is taught; still, there is not sufficient connection with the home life. I think that is a flaw in our system altogether. Kindergarten children attend to the cleanliness and orderliness of the room. They lay the table for lunch and they clear it up afterwards. They talk about the farmer and the autumn, and then they visit the mill, and in this way things are related to each other in the right way. They care for the dolls and the dolls' house and the dolls' bed, and they are actually allowed to do a little cooking. Then when the children leave the kindergarten they go into quite a different atmosphere. All these things are disconnected, and form no part in the school life. I think whatever work is undertaken in this respect should be undertaken by the class teacher. It should not be considered something quite outside the other lessons. There would be a room needed. That certainly would be a great help to children, because they would work better when they went back to their desks if they had a little more freedom when dealing with these special subjects. I am not an advocate for women being in very public positions, but I must say after what has been done in the past it seems almost as if women were needed to assist in organizing the schools, seeing that the girls' education has been so absolutely neglected in this respect. I have not said much about the sewing syllabus. Sewing should be done in connection with this domestic work: it should not be taught as a sort of manual work. I may say that in many places the work is done in the school by the class teacher, and of course in many places, such as London, it is done in a separate class under separate teachers, but in many schools in America and even in England I saw very good work done in this direction. I hope something will be done to put girls in our schools on a better footing in this matter.

4. *Mr. Pirani.*] You did not say at what age you would take the children in the kindergarten?—Under five years—three and four years of age.

5. And you would keep them how long?—Until they are five, to go into the primary school.

6. Do you know of any obstacle now in the way of an Education Board establishing kindergarten schools in connection with their other schools?—We have one in connection with the normal schools at the four centres.

7. Are you aware whether there is any kindergarten here subsidized by the Government?—Yes.

8. Then, considering the Government subsidizes free kindergartens outside the primary schools, can you see any obstacle in the way of the Government subsidizing them in connection with the Government schools?—I think it would be a very simple matter to adjust the latter so that it could be done, and I think it would be a great advantage to both.

9. *Mr. Kirk.*] You are aware that there are schools privately conducted for girls alone?—Yes.

10. Have you had any opportunity of judging the result of the finished education at such schools with the result of the finished education at the mixed public schools?—Only by general experience; I have not compared the girls individually.

11. Which gives the better result so far as correlation between school duties and life duties is concerned?—I am positively of opinion that the mixed school for young children is better.

12. Does that not seem to imply that the teaching of boys and girls together has very little wrong with it?—No, I do not think so. I think boys can learn a great deal of this work I have been suggesting as well as girls, and I think it will do them a great deal of good. There is the same fault in connection with boys' education—I would say there was too little initiative.

13. Dealing with the open-air schools in big cities, do you think a fair comparison can be made with such schools so far as a small Dominion like ours is concerned?—Directly we have the number of children, I think so. We have the same class of children. I think we only need one school in each centre for these children.

14. Have we even sufficient for that yet?—I think so.

15. Have you any statistics to bear you out?—Only that I know that I have made inquiries, and in every large school there are several teachers who have given me lists of the children in their school. I may say this was suggested by a teacher in a large school in Auckland to go south as a remit.

16. You know there are schools for the normal children and schools for the mentally deficient; but you think there is a sufficient number between these classes for whom separate schools should be established?—Yes.

17. You think there is a sufficient number of backward children to justify the establishment of separate schools in each of the four large centres?—Yes.

18. However idealistic our feelings may be, I suppose you will admit that we cannot give expression to them at once, but must go along slowly and in accordance with our means?—Yes.

19. *Mr. Thomson.*] On what do you base your opinion?—I say there are sufficient in the Dominion to have schools in the four centres on the witness of teachers who have these children in their schools.

20. Can you get any teachers to give definite evidence on this matter?—Yes.

21. In regard to kindergartens, do you think they could be established in the country districts, or are you speaking of them only in connection with cities?—I think at first they would only be established in the cities, and in the districts where the people live in crowded places, and where mothers have not the time and do not look after their children properly.

22. I suppose the objection to country kindergartens would be the travelling by such young children over long distances?—Yes.

23. I suppose it would be a very good thing for country children, owing to their isolated conditions, if they had these kindergartens?—That is right. Country children are barred from all social intercourse.

24. *Mr. Davidson.*] I understand that you are in favour of the establishment of kindergartens in connection with the primary schools in New Zealand?—Yes.

25. Have you considered the cost of such a reform?—Yes. I think, so far as training teachers is concerned, we have the training colleges established now. Then there would have to be a supervisor or head teacher for the city. Then I think the students who had been trained could take separate kindergartens under her supervision. I would hardly like to make an estimate of their salaries, but as kindergarten teachers get less than £100, then I think £100 would cover that.

26. How many pupils would you allow to each teacher?—Not more than thirty.

27. And you think that each teacher should have at least £100 a year?—No, I said less than £100.

28. Well, just now the women teachers of New Zealand are crying out for higher salaries, and you surely would not ask any teacher who had spent years of training to teach for less than £100 a year?—I will take £100 a year, and I will say thirty children to each teacher.

29. At the very lowest estimate, then—at thirty children for each teacher and £90 a year for each teacher—that would mean £3 per child?—Yes.

30. You said you would have them enter the school at three years of age: have you considered the number of children in New Zealand between three and five years of age?—Yes; I tried to reckon up the cost a little bit. I know it means a great deal, but I think it has compensations, and I think it would curtail a great deal of the money spent afterwards in reforming children, and so on.

31. Do you think that the people of the Dominion would stand this extra expense which I have reckoned to come to between £120,000 and £150,000 a year, and particularly in view of the fact that you said in reply to a Commissioner that this extra money would be spent mainly in the four cities?—I do not think they would, because they do not realize at present what it means; but I think they would if they knew.

32. Would you confine this good work just to the four centres?—It is like this: I know things have to be begun; you cannot do them straight off. One thing I said was that I would advocate the establishment of kindergartens because of their influence. I think it would be well for the Department to have them in connection with their system of education. There will be kindergartens whatever we do, and I think they are worth having, whatever they cost.

33. If you cannot get these real kindergartens introduced in connection with the whole of our education system, would you not introduce kindergarten methods into the teaching of all the subjects at present taught in our schools as a beginning?—That is my object. It seems to me that unless people try to understand the kindergarten itself, they do not realize the spirit of the principles of the kindergarten; but if they once are interested in the kindergarten, it is wonderful how quickly its influence makes itself felt. An instance came to my knowledge in Auckland just recently. Some Sunday schools started a kindergarten, and it has resulted in very many of the Sunday-school teachers in Auckland taking a greater interest in teaching on right lines. That is proof of the influence of the kindergarten.

34. You spoke of Victoria, and what is being done there: how many training colleges are there in Victoria?—I know of only one in Melbourne.

35. How many students at the training college in Auckland?—100.

36. And there is an equal number in each of the other three in New Zealand?—Yes.

37. So we have 400 students in training in New Zealand?—Yes.

38. How many do you think are being trained in the whole of Victoria?—I do not know, but I know a good many more kindergarten students are being trained. That is the part I take the greatest interest in.

39. You said just now that kindergarten teaching was being given at the training college here?—Yes.

40. It is also being given at the training college at Dunedin?—Yes.

41. And I suppose these schools are attached to the training colleges in the two other centres?—Yes.

42. Then, there must be a great many more students receiving kindergarten instruction in New Zealand than in Victoria?—All the better for New Zealand.

43. *Mr. Hogben.*] Looking forward some years, are you aware how many teachers would be required, supposing we make kindergarten instruction universal in our schools?—We would need a great many; of course, looking forward a great number of years. I think probably if kindergarten principles and home training became what they should, kindergartens would not be so much needed. I am looking at the kindergarten as an influence. Perhaps what you establish now would be sufficient for later on.

44. With regard to domestic science, have you seen the new regulations for elementary home science in connection with the Junior Civil Service Examinations?—I have not.

45. *The Chairman.*] I presume you know, as one who has travelled and read, that no progressive educational country in the world, not even Japan, has failed to recognize the value of the kindergarten as an initial step in the system of State education: do you not think the time has arrived when New Zealand should make that departure?—I do.

46. Will you be surprised to know that it is twenty-eight years since an Education Committee in New Zealand considered this question with a view to its adoption, and that nothing has been done?—I had not heard of that.

47. Is it not a fact, too, that the kindergarten system is admitted on all hands to be the best system known to-day of teaching the young how to use the hand and eye industrially?—Yes.

48. Such being the case, is it a correct or incorrect thing to say that the kindergarten system is the true basis of industrial education?—I think that is quite true.

49. Agreeing in that statement, you think the time has arrived when the kindergarten should form part of the educational system of this Dominion?—Yes.

50. Can you give us any idea of the number of children who would be likely to enter classes in the four centres, assuming it were grafted on to the State system of education to-morrow, between the ages of three and six?—No, but the number would be very large, and the expense very great; but I think it would be worth it.

51. But would not the primary-schools expenditure be reduced proportionately by taking into the kindergarten the children now admitted at five?—Yes, if the same expenditure were made to cover both things.

52. Would it surprise you to hear that the testimony of those best qualified to judge is that all children who go through a systematic course in a kindergarten are able to go through the standards of the primary schools much better and to better appreciate the education given there, and are in every way a better product, than the ordinary primary-school course produces?—I think that is quite true, from what I have seen of children myself that have been in kindergartens. They have been absolutely more fit to receive education in the school.

53. And I am safe in saying that the establishment of kindergarten courses in each of the training colleges presumes that the Education Department had some idea of establishing kindergartens as well as the training of kindergarteners?—It shows their appreciation of the kindergarten and its influence on the students.

54. You would indorse the statement that the primary-school system would be better for the incorporation of the kindergarten system right through the course?—A professor in one of the biggest Universities in America said that no professor in a University could afford to be without a knowledge of the kindergarten. I quite agree with you that it is necessary in all work. Its influence would be very great.

FRANCIS HAMILTON BROWN examined on oath. (No. 7.)

1. *The Chairman.*] What are you?—I am first assistant in the Newton East School, and President of the Assistant Masters' Association. My qualification is C1.

2. Will you kindly state what you have to say on behalf of your organization?—I wish to emphasize the urgent necessity for more ample play-grounds. Cadet officers, of whom I am one, feel this necessity perhaps more than any other branch of the profession. We have to take the cadets into the road for physical drilling. We agree that the number of examinations at present in vogue is excessive and unnecessary. The principal question that I came to urge was the abolition of clauses (*c*) and (*d*) of the Second Schedule of the Act of 1908. Clause (*c*) says, "At least one of the first three assistants in any school shall be a woman," clause (*d*), "At least three of the first six assistants in a school must be women." We hold that all the positions should be thrown open in the Dominion—headmasterships, assistantships, or sole charges. We hold that this will be fairer to the whole body of teachers. If they are to be graded on the same list, and a lady is found to be the most efficient on that graded list as established

by the Inspectors, then, if she applies, that lady, in our opinion, should get the position; but if a male is highest on the graded list, and consequently more efficient, he should get it. There should be none of this dispute as to whether a man or woman should get the position. It should simply be a question of the greatest efficiency. This, we maintain, will tend to the greatest efficiency of the school, inasmuch as the highest-grade teacher and the most efficient will get the position in each case. The present system as laid down in this Act is, to a certain extent, a system of preference, and that, we hold, is not equitable. We hold that there should be equal pay for equal work, and that we must have equal advantages and equal opportunities for every branch of the profession.

3. *Mr. Kirk.*] Do you agree with the evidence of Miss Simpson?—To a very great extent. Parts of it I do not agree with, particularly that in reference to the want of sympathy shown by male teachers to the girls.

4. I mean, do you agree with the evidence of Miss Simpson on the main points?—So far as throwing open all the best positions, I do. Miss Simpson was not very strong on that point, and I am.

5. Then, you disagree with her?—Yes, so far as closing the appointment to any particular person.

6. *Mr. Davidson.*] I understand you to say you object to the ear-marking of any position in the service for either a man or woman?—I do.

7. Miss Simpson really wished that certain positions should be ear-marked for women?—I understood her so.

8. *The Chairman.*] Do you not think that women have a constitutional method of stating their alleged grievances and wrongs?—Yes.

9. And that they will use it?—Yes.

AUCKLAND, THURSDAY, 6TH JUNE, 1912.

HAROLD JAMES DEL MONTE MAHON examined on oath. (No. 8.)

1. *The Chairman.*] What are your position and qualifications?—I am a B.A. of the New Zealand University, and chief English master at the Auckland Grammar School, and I appear here as representative of the assistant masters of the Auckland Grammar School.

2. On what subjects do you wish to speak?—The first point I wish to make is that the grant for secondary education is not sufficient for rational and efficient education, and I wish to maintain my position by means of a few statistics. Dr. Garnett, who is director of education for the London County Council, in an appendix to the report of the consultative committee on higher elementary schools in England, says that the minimum amount for efficient secondary education is £15 a year per pupil. In estimating such grants we should take into consideration the difference in the cost of living between New Zealand and England. I think that on a very reasonable basis the cost of living is at least 30 per cent. more here than in England, so if we take Dr. Garnett's basis the amount that should be granted for efficient and rational education in New Zealand is from £19 to £20 per pupil. In Prussia, which is not one of the best paid of the German States, the cost of secondary education per head is £16. The cost of living is very much cheaper in Prussia than in New Zealand. That would make at least £20 per head necessary in New Zealand. If we look at the cost of secondary education in New Zealand we find from the last report issued that the amount available per head was £13·06 in 1909 and £13·04 in £1910, but the amount spent per head in 1909 was £11·24 and in 1910 £11·52. The average salary in 1910 for male assistants was £195 9s. 9d.; for female assistants, £159 2s. 1d.; and for all teachers in secondary schools, £176 14s. 2d. From the present statistics I infer that we must have one or two conditions—either that the schools are understaffed and the teachers overworked, or that where the schools are of reasonable size the teachers are underpaid. I think that point might be brought out by a comparison between the conditions prevailing in the Auckland Grammar School and those in the Wellington College. In 1910 the number of pupils in the Auckland Grammar School was 456 and the number of assistants was thirteen, and the average per assistant works out at £260. In Wellington the number of pupils is 345; there are eighteen assistants; and the average is only £215 per assistant. The consequence of this is that teachers, especially married men, have to seek other means of remuneration. I understand that in Wellington a large number of teachers are engaged in evening work at the Technical College, and in our schools some teachers who are getting £200 were coaching till this year. The headmaster saw that that was not in the best interests of the school, and he prevailed on the Board to increase their salaries, and made it a condition that they should take no outside work. This condition of things has a number of unfortunate results. The prospects are so limited in secondary schools that a large number of teachers merely use secondary education as a stepping-stone to some other profession. A number who are attracted by the fairly good salaries at the outset enter for a couple of years merely to gain some money to pay the expenses of equipping themselves for another profession. I can instance several cases. In our own school in recent years one teacher after a few years' experience abandoned secondary education to go in for medicine, another to go in for electrical engineering, and another for surveying and civil engineering, and another took a position on the Geological Survey. This state of things is unfair to the pupils. When these teachers enter they are, as a rule, inexperienced in teaching, and it is not likely when they intend to relinquish the work in a few years that they will take any rational or scientific interest in their work. The pupils must suffer accordingly. Again, the prospects are limited, and we find men who have done good work in the service abandoning it after twenty years for another profession that offers better remunera-

tion. Notable cases are those of Mr. W. F. Ward, of Wellington College; Mr. Alpers, of Christchurch; and Mr. Macalister, of Invercargill; and there are many others. As to the qualifications of a teacher in a secondary school, he must be a man of refinement and ability, a man capable of exercising a good influence on the pupils, he must put his whole soul into his work, and he must by reading keep himself up to date in knowledge of educational methods. It seems to me that those qualifications ought to demand better remuneration. Professor Michael Sadler, one of the best-known English educationists, has recently asserted that the minimum salary of a secondary-school teacher in his prime should be £300 a year. When we take the cost of living into consideration, that would mean £400 in New Zealand. I might bring out this point by referring to the better prospects of teachers in Germany, for example. There has recently been published by the Secondary School Teachers' Association in England a report giving an account of the conditions of employment in England and abroad. The report gives tables showing the prospects of teachers in the various German States. To take Prussia for example: The initial salary is £135, and it rises by yearly increments until in his twenty-second year of service the assistant in a secondary school receives £360 per annum plus a rent-allowance varying from £60 to £28, thus making the total a least £388. If you take the cost of living into consideration it would mean that in New Zealand we should look forward to the prospect of at least £500 to be on an equal footing with them. In Hamburg the initial salary is £200, and it rises by regular increments to £450, the maximum being reached after twenty-one years' service. Not only is it better in the amount of actual remuneration, but the pension conditions are on a much more liberal scale. I will take the same States, but the conditions in most of the other States are very similar. In Prussia the maximum pension is 75 per cent., which is reached after forty years' service. The allowance to the widow is 40 per cent. of the salary.

3. *Mr. Davidson.*] Average salary or retiring salary?—It does not say.

Mr. Hogben: It means average salary.

Witness: The allowance to orphans who have lost one parent is 20 per cent., together with the widow's allowance. In the case of orphans who have lost both parents, the allowance is 30 per cent. of the salary. But the allowance to widows and orphans together must not exceed what would be the father's pension. I think that when we take those facts into consideration it is clear that the status of the New Zealand secondary-school teacher is not nearly as good as that of the teacher in Germany. The next point I would like to emphasize is the size of the classes in the secondary school. In the German school—and the same conditions obtain in most of the English schools—the number of pupils in a class averages from twenty to twenty-five. The teachers in secondary schools work from eighteen to twenty-four hours a week. A master whose work is oral, and of a trying character, seldom works more than eighteen hours a week, and as the school is open for six days in the week he averages from three to three and one-third hours per day. Perhaps a better idea will be obtained from a specific example. In a school of 300 there will be twelve classes with an average of twenty-five to a class. Each class works about twelve hours a week. For the twelve classes there will be 360 hours of instruction. That was the principle explained to me of the staffing of a German school, and I have recent reports bearing out that statement. I noticed when I was in England in 1906 that in some of the higher elementary schools the staffing was on a liberal scale. In Hornsey School, one of the higher elementary schools, there were 278 pupils. The staff consisted of the headmaster and fourteen assistants, and each of the assistants taught from twenty to twenty-two hours a week. The next point I wish to dwell upon is the curriculum in secondary schools. It seems to me from my experience that there should be a differentiation in the syllabus—that, for example, all pupils should not be required to take Latin. My experience is that only the very best boys that come to the secondary schools profit by the study of Latin. It is not likely to be of much intellectual value or of much value from the point of view of culture unless the boy at the end of his career can read the Latin classics as he would read the English classics. The number of boys who can do that is comparatively small. It seems to me that, in the case of the pupils who come merely on a certificate of proficiency, the time would be better spent in teaching only one modern language—say, French—and that the time devoted to Latin should be devoted to gaining a higher standard of proficiency in the mother-tongue and to manual work taught on a rational basis so as to co-ordinate it in a great measure with the other subjects in the school. When I was at Hornsey I was impressed by the way in which manual work was taught. It was explained to me by Mr. J. C. Hudson, a man of great culture and great enthusiasm for his work. He maintained in conversation with me that only such work should be undertaken in wood and metal as would develop the originality and appeal to the emotions of the pupils, and at the same time co-ordinate with the other subjects in the work of the school. He made it clear to me that at the earlier stages the children were encouraged to modify their own designs. He showed a number of designs of knife and blouse boards that had been modified by the pupils. They had made models to illustrate the way in which the school was ventilated, and others to illustrate the history of locomotion. Another set of models dealt with cave, tent, and lake dwellings; and a model of the Pantheon at Rome gave the pupils a conception of the forms of architecture. In this way woodwork and metal work can be co-ordinated with history and drawing and science. They may be made a real medium of culture, and have more than the benefits claimed for them as second-school subjects by Professor William James, who says, "Laboratory-work and shop-work engender a habit of observation and a knowledge of the difference between accuracy and vagueness and an insight into nature's complexity and into the inadequacy of all abstract verbal accounts of real phenomena, which, once brought into the mind, remain there as lifelong possessions. They give honesty, for when you express yourself by making things and not by using words it becomes impossible to dissimulate your vagueness or ignorance by ambiguity. They beget a habit of self-reliance; they keep the interest and attention always cheerfully engaged, and reduce the teacher's disciplinary functions to a minimum." If for a very large number such

a programme were insisted upon in our secondary schools we should be sending into the world youths with a broader and more liberal education, with better aptitudes for both mental and manual work, and with higher ideals than those of mere getting and spending. With regard to the manual work in secondary schools, Mr. Heaton, the science master at the Grammar School, maintains that any system of science that is worthy of the name must be accompanied by some course of manual work, including glass-blowing, but thinks that at the present time the teaching of science is hampered by the short time which is given to it. He says in reference to this, speaking of his experience of the Wyggestin School, one of the best of the modern secondary schools in England, "The boys enter at the age of thirteen, and at the end of three years complete a course that extends over five years in New Zealand. The last two years are devoted to special work, and at the end of his five-years course he could pass the M.A. examination of the New Zealand University in science, and gain first-class honours. I attribute the higher standard of work in a school like Wyggestin to the fact that the classes are small. The conditions are very different in New Zealand, and the teachers cannot be expected to work miracles." With regard to the courses in secondary schools, the report of the consultative committee of the English Board of Education upon higher elementary schools said, "'The committee considered that the years spent at the secondary school furnish the only opportunity that a pupil may have to acquire a broad and humanizing training. The diversity of occupations that the pupils take up after leaving the school is so great that in most cases it is difficult to say what would be useful; and it is undesirable to sacrifice any part of their general education for the sake of a subject that would be of very little real use to them.' The evidence, on the whole, was decidedly against imparting any particular knowledge or dexterity that might be learnt, and would naturally be learnt, during the period of apprenticeship. An engineering witness said, 'I do not advocate including in the school curriculum any of those things which a boy will afterwards have a better opportunity of learning in his handicraft or employment.' The representative of the Scotch Department said, 'I should say that to attempt to introduce anything definitely technical into a day-school is somewhat hazardous. Technical instruction comes better after a pupil has taken up some line of life and knows what he wants.' Another witness summed up thus the case against book-keeping as a school subject: 'It is quite absurd to try to teach from a text-book—perhaps by the agency of a man who has never been inside an office—the details of the procedure of a large office with which the boy is quite unacquainted, which are absolutely unreal to him, and which will lead to the most mechanical form of work; and probably when you have finished you will have taught him a system of book-keeping which he will have to unlearn in the first office he goes into.' Another witness said, 'What I feel strongly is that in the attempt to introduce these subjects into the curriculum we are sacrificing the development of a more important thing—the habits of mind which will be important in commerce.' My own experience agrees with the report of the committee on the question of including shorthand in the school curriculum. There is not time enough to teach it efficiently. It has little or no educational value, while the majority of those who take it up never make any further use of it. The report was equally decisive against the inclusion of typewriting: 'Even in the case of women we should be opposed to it, not only on general grounds, but because we understand that employers require in typists a much higher standard of general education than can be expected from girls who leave school at the age of fifteen; nor should we desire to see encouraged the tendency to increase the number of poorly-paid women clerks when preferable careers are open to women in other professions.'" I may mention that the experience of German educationalists agrees with this report, but in Germany there is an intermediate secondary school called "realschule." In these schools all the subjects are such as are taught in a secondary school, great importance, however, being given to mathematics, science, the mother-tongue, and modern languages. Classical languages are rigidly excluded. In those schools there is nothing whatever of a technical nature, and a three-years course at these schools is insisted upon in most cases before a youth can enter an engineering school, a marine school, or a school of commerce. The opinions of these educationists is that the best preparation for life is a broad general education, where application and habits of thought are cultivated. At the present time there are two other defects in our secondary system—first, that the examination system is overdone; and secondly, the fact that a number of youths come to school and merely put in one year, leaving without doing any good at the school to themselves or any one else. Many others keep one eye on the examination, and put in the minimum amount of time and work needed for their examination. Whether the subject will be of any benefit does not concern them. Mr. Heaton informed me that he lately reproved a boy in one of his classes for the small amount of progress he was making. The boy came to him afterwards, and asked permission to give up heat and read mechanics alone, because he was going to be an engineer, and heat did not come into his examination. We want in our education to see that boys are taught to value knowledge for its own sake; otherwise the education grants are being largely wasted. The remedy lies in increasing the grant in order that we may have smaller classes. Then the teaching will be more rational, and the influence of the teacher upon his pupils much more marked. A second reform is in the direction of fewer examinations. It has been already urged by the Inspector-General that a satisfactory four-years course at a secondary school should be considered a qualification for entrance to the University. Personally, I maintain that that is an ideal method; but in New Zealand there are practical difficulties in the way. In Germany, where education is well organized and the teachers take a scientific interest in their work, there are absolutely no examinations in girls' secondary schools. In boys' secondary schools there are two examinations during the year, but they are of a very minor character—not nearly so exhaustive as in our secondary schools, but merely examinations to test the progress of the pupils; and then there is the final leaving examination, which is the qualification for admission to the University, and which is conducted almost entirely by the teachers responsible for the subject and the headmaster, an official of the Educa-

tion Department being sometimes present to see that everything is satisfactory. The high conception that German teachers have of their work is such that they are practically given a free hand, and they allow none to go forth to the University who are not in every way efficient and qualified to do good work there. If such a system could be introduced in New Zealand it would be the ideal system. Personally, I should fail a number of pupils who now pass matriculation. But the difficulty is that all our secondary schools have not the same standard. It has been suggested that in the smaller districts pressure might be brought to bear upon the teachers. Of course, the teachers would need a lot of backbone to resist the influence of parents in a country where the people are not so highly disciplined as in some of the European countries. This, for the time being, at all events, would prove an obstacle to the introduction of what seems to me the ideal method. Another point upon which I should like to speak relates to scholarships. I notice that in a recent interview Mr. Mulgan, Chief Inspector of Schools in Auckland, stated that in some cases scholarships are held at a district high school, and that if a pupil living within reasonable distance of the district high school wishes to go to a larger town to hold his scholarship no boarding-allowance will be granted. Personally, I think that that is a great mistake. The education a boy receives at a secondary school does not consist merely of the information acquired to enable him to pass examinations. A most valuable part of his education there is association with other boys. It comes from the school life—the taking part in sports and debates, and what may be called in general terms the life of the school. If that rule is insisted upon a very great injustice is done to a number of country boys. To take merely the case of my own school—I may point out that a boy from a remote country district, K. Sisam, who came from Whakatane, and another, Marshall, from Warkworth, passed through the school and gained Rhodes Scholarships. I think that is a good argument for allowing boys to come to a good school, where there is a sound and healthy school life. Another point that needs reform in connection with secondary-school work relates to the training of the teachers. A very large number of the teachers come to us fresh from the University, and they are put in authority over fairly large classes. I do not think that that is in the interests of either the teachers or the pupils. I have also been asked to emphasize the matter of superannuation. The secondary-school teachers agree with the primary-school teachers in asking that in estimating superannuation any three years of the teacher's service should be taken into consideration, and not merely the last three years. I admit that in most cases a teacher will be receiving his best salary in the last years of his career, but there are exceptional cases where a teacher, through ill health, is compelled to take a lesser position. In such cases it is unfair that his retiring-allowance should be estimated merely upon the unfortunate last years. I think, too, that in the case of secondary teachers they should be allowed to retire after thirty-five years' service. They begin their career later than the primary-school teachers. Very few start before they are twenty-two or twenty-three years of age, and if they have to wait for forty years for superannuation I am afraid that very few years would be left to them to enjoy it. Another matter that has occurred to me relates to district high schools. Looking through the list, I notice that, for example, there is a district high school at Paeroa, another at Te Aroha, another at Waihi, and a high school at the Thames. At the Paeroa School there are forty-one pupils, at Te Aroha nineteen, at Waihi thirty-six. The cost of educating at those schools ninety-six pupils is £906 10s. At the high school at the Thames there are seventy-five pupils, the cost being £1,822 18s. 10d. The total cost of the 171 pupils at the four schools is £2,729 8s. 10d. There would be a great gain in efficiency if a central school could be established for such a district. Paeroa is the centre of the district, within easy railway-communication of Waihi, Te Aroha, and Thames; and it seems to me there would be a much better classification, and consequently increased efficiency, if there were one central secondary school instead of those four institutions. With regard to private schools, it seems to me that it is the duty of the State to see that efficient education by skilled teachers is given in all schools, whether Government or private. With that end in view I think that all private schools, whether primary or secondary, should be under Government inspection. In order to bring that about, I think some scheme of registration of teachers should be instituted in New Zealand. There is such a scheme in Victoria, for instance; no teacher is allowed to teach in any private school there unless he is on the teachers list, and has such qualifications as the State thinks essential for successful work. These are the main points that I wish to bring before the Commission.

4. *Mr. Pirani.*] How would you narrow the examination so as to ensure that it would not be overdone?—In the first place, I would have only two examinations a year in a secondary school. Examination entails upon the master a considerable amount of work. He has first to think out his paper, and get it printed. Then there is the arduous work of examining and estimating the work of the pupils, and there are the various returns in connection with the schools. I think two examinations a year would be sufficient, instead of one at the end of each term. Some pupils undergo perhaps five or six examinations in their last year—the three term examinations, and perhaps the Civil Service Examination, and the Matriculation Examination. That is in the higher classes. In the middle forms there will be the term examinations and the Senior Free Place and Scholarship Examinations. I think some effort should be made by co-operation between the Education Department and the University Senate to have one representative examination for secondary schools to serve for Senior Free Place, Junior Civil Service, and Matriculation Examinations.

5. Is it not your custom, where pupils are going up for other examinations at the end of the year, to omit the school examinations?—No.

6. Do you not think it would be advisable to do so?—No. There are prizes offered, for which the pupils would not forego their chances.

7. Would it not be desirable to have all the secondary schools in a district placed under one control—say, the Education Board or some other authority to take the place of the Board?—I think it might tend to greater efficiency.

8. *Mr. Wells.*] What is the size of the classes at the Grammar School?—The first-year classes vary from forty to forty-five; the second-year classes are in some cases over forty; and this year the third-year class, the matriculation class, began with forty, and has fallen to thirty-five during the year. The B class in the fifth form is about the same size. The C class is somewhat smaller. The lower sixth numbers about twenty-seven, and the upper sixth about sixteen.

9. Then, except in the very highest classes, the numbers are practically double what they are in the best German and English secondary schools?—Yes.

10. Has attention ever been called to this fact?—I think the Inspector-General of Schools has reported upon it on two occasions lately. The Board has made some provision for increases of staff, but there has been such a large accession of new pupils that we have not benefited much. I do not know what will happen next year unless we get a new school-building.

11. Have you not been a primary-school teacher?—Yes, for two years.

12. What is your opinion as to the benefit of training in a primary school for a secondary-school teacher?—Personally, I attach very great value to it. I think I derived a great deal of benefit from it.

13. If all the schools in a district—primary, secondary, and technical—were under one authority, would it not provide the secondary schools with better-trained teachers, and at the same time give a far better outlook in the way of promotion?—I think it would. At present one of the disadvantages of secondary work is that the outlook is so very limited. Positions worth more than £300 a year are very few indeed; and, moreover, secondary teachers are practically debarred from all appointments outside secondary work. They have little chance of becoming Inspectors. I think the secondary teachers would welcome any chance of becoming headmasters of primary schools.

14. Would not the accrediting system have a stimulating effect, in this way: that presumably only schools in a thoroughly good condition should be allowed to accredit?—I think that should be made a condition. I think it would have a stimulating effect if the pupils knew that the masters would only allow those to go forward who did really honest work throughout their career.

15. Suppose it were understood that the privilege of accrediting would be withdrawn if unsatisfactory pupils were sent on?—I think that would have a good effect.

16. Do you see any objection to the accrediting system in the primary schools for free places—from good schools?—I see none. There is a great difference in the quality of the pupils that come to us at the beginning of the year. As a rule, those who have passed the Junior National Scholarships Examination are much superior to those who have merely gained the proficiency certificate. Great discretion would be required from the teachers to see that only those truly qualified should come up. I may mention that some time ago I noticed in one of the journals a report on the Northumberland system of scholarships. The headmasters of the schools were asked to send in the names of the pupils they thought qualified for admission to the secondary schools. All those who were put on the list were given a written examination on the essential subjects, and then a *viva voce* examination. If that could be managed, it is an ideal way of making the selection. We have then the opinion of the headmasters, we have the written examination, and—much more important—we have the *viva voce* examination.

17. Do you find that there are many free-place pupils who are not likely to be worth their places?—Not a large percentage.

18. Is there not a fair percentage who would have done better work at a technical school?—A small percentage.

19. Would there be any advantage in having a consultation with the headmaster as to which course they should take up?—I do not think many boys know what career they are going in for when first they come to a secondary school.

20. Would it not be worth while to have a consultation between the parents and the teacher as to whether pupils should go to the Technical School or the Grammar School?—I think that the day course at the Technical School coincides to a large extent with ours. A modification of the curriculum would overcome that difficulty.

21. Are you aware of any overlapping between the Technical School and the Grammar School?—I think that in a number of classes the work is very much the same, except that they go in for definite commercial work at the Technical School. As far as I know, there is no great amount of overlapping, but I think that the teaching either at the Technical School or a secondary school of shorthand and typewriting is a great mistake. I think it should come only in the third year, when the pupils have a broad foundation to go upon. Business men have complained to me that a large number of the typists they employ cannot spell properly. That is because they are not taught properly before they specialize.

22. Is any instruction as to the duties of citizenship given at your school?—Personally I try to bring that out in my teaching of literature. Moreover, in the higher classes we have debates, and I choose subjects that are likely to stimulate the interest of the students on public questions. The boys take great interest in these matters, and I am very well pleased with the progress they make. There is no definite course in civics, but it is taught indirectly.

23. *The Chairman.*] Do you think it would be better to have definite teaching in civics?—Certainly, the boys should know something about the questions that are exercising the public mind, and their duties as citizens. It should form part of every scheme of education.

24. *Mr. Kirk.*] How can the training of teachers for secondary schools be best assured?—In Germany teachers who are going in for secondary teaching have to undergo what are called two probationary years. They are appointed as probationers for two years, and during that time

they take some part in the teaching. They give model lessons, under the supervision of the headmaster. They have to study the science of education, and at the end of two years to pass an examination, both practical and theoretical, before they are definitely accredited as teachers in secondary schools. I think some such method ought to be introduced in New Zealand.

25. Do you think it would be sufficient to make it a condition precedent that the teachers should have a certificate, or qualify through a training college?—That would be an improvement.

26. Would it be sufficient?—Provided the academic qualifications were satisfactory.

27. Is that as far as you would go?—Personally, I think it would be very much better if we had a system somewhat similar to that of the two years' probation that obtains in Germany. I admit that it would be difficult here, because teachers of twenty-two or twenty-three years of age would not like to be put under probation for two years unless higher inducements were held out.

28. When you spoke of the Prussian system, especially with regard to the cost, from what authority were you quoting?—From an article in the *School World*.

29. In view of the fact that some pupils whom the headmasters do not consider fit for free places nevertheless sit for and pass the examinations for Junior Scholarships, is there any danger of such pupils being prejudiced under an accrediting system?—In the case of a properly introduced accrediting system the examinations should be abolished. At present we have the accrediting system to some extent. At our school numbers of pupils are accredited for senior free places. Those who are not accredited may go up for examination, and they generally pass.

30. Assuming that there were no examination, and that the accrediting system alone were in vogue, is there any danger of really bright pupils being prejudiced?—I do not think so. If the classes were of reasonable size there would be absolutely no danger of that.

31. *Mr. Poland.*] How do the scholarship and free-place holders of to-day compare with the boys who attended the Grammar School, say, ten or fifteen years ago?—I do not think their attainments in general subjects are very much higher. I think that is the general opinion of our staff. In fact, some of them think that in recent years there has been a falling-off in the qualifications. Mr. Heaton is under the impression that the classes in the primary schools are too large for individual attention. There are too many subjects, and insufficient stress is laid upon the essentials of education.

32. Is it your experience that the essentials of education, as taught in the primary schools, are equal to what they have been in the past?—The general impression of our staff is that there has been a falling-off in recent years.

33. *The Chairman.*] Would you be prepared to indorse Mr. Heaton's estimate?—Yes.

34. *Mr. Poland.*] As the teacher of English, what have you to say as to the equipment of the scholars who come from the primary schools?—The great fault I find with them is that they cannot state a simple thing in a simple way. There is too much straining after effect in the composition. In their first two terms I have a difficult task in making the boys express themselves simply. That is the case with the best of the boys, and it is more pronounced in the lower classes.

35. Do you think that doing away with the teaching of formal grammar in the primary schools is in any way responsible for the falling-off in the quality of the English?—I do not think very much formal grammar should be taught in the primary schools. The only formal grammar that should be taught is what is essential to the writing of correct English. In the old days too much formal grammar was taught. I think English grammar can be best illustrated from an inflected language like Latin.

36. Is there any difficulty in obtaining qualified teachers for the Auckland Grammar School at the present time under the salaries and conditions offered?—There are not as many applications as there used to be, and, as I have already pointed out, a very large number of those who enter the service leave it after a few years for other careers.

37. You think much better work could be done if the staff were strengthened and the general outlook were improved?—Certainly.

38. *The Chairman.*] And if the pupils came to you from the primary schools better grounded than they are now?—That is the general opinion of the staff—that the essentials are not taught as well as they used to be. The science master, for example, says that in his department the only preliminaries required are arithmetic and composition, and he complains bitterly of the weakness of the scholars in arithmetic.

39. And you personally find fault with the weakness of their composition?—Yes.

40. *Mr. Davidson.*] You say you think considerable waste of money takes place in admitting children into our secondary schools who will remain for only one year?—Yes. I think there ought to be an undertaking on the part of the parents that their children shall remain for at least two years.

41. There would be a considerable saving to the State if those who would not remain for at least two years were excluded?—Yes.

42. Do you think an average of twenty-five pupils in a class too many for a single teacher?—No. I think that is about what it should be. In the lower forms one could teach advantageously something over thirty, and not more than thirty in the middle forms; but in the matriculation classes we certainly should not have more than twenty-five, nor in the highest class more than fifteen to twenty.

43. Does not the State really provide for an average of thirty—£375 per class?—That is for the lower classes.

44. I notice in the departmental report that the average per class in 1910 was 20·9 for the whole of New Zealand. If that is so, what means would you suggest for reducing the number in the large classes?—What is necessary is to increase the grant sufficiently to pay decent salaries to the teachers, and to have classes of reasonable size. Otherwise you cannot have efficient education with big classes. I think I made it clear that we cannot hope to have secondary education such as obtains in Germany on £12 10s. a head. The £12 10s. is spent not merely on the staff, but also in the maintenance of buildings and making provision for extra buildings.

45. Would you favour local rating for the purpose of providing to some extent for the building and upkeep of the schools?—It prevails in other countries—in England and Germany. There is a threefold source of revenue—the pupils pay fees, the Municipality exacts a school-rate, and the State makes a grant.

46. Do you think it would tend to increase the efficiency of the system if local rating were brought into operation?—It depends entirely upon the amount of the rating.

47. Would it not increase the interest taken in secondary education by the people themselves if they had to provide for it directly?—It does in other countries, and it should here.

48. And are you in favour of subsidizing the amounts raised locally?—I think that ultimately it must come to that in New Zealand. That is my personal opinion, but I have not gone into the matter from the statistical point of view.

49. *The Chairman.*] Have you done so from the economic point of view?—I cannot say I have. I know that the general feeling is against local rating.

50. *Mr. Davidson.*] Do you think that is because it is not thoroughly understood?—I think it would have to be made clear, if there is to be local rating, that the ratepayers will have a *quid pro quo* in the reduction of general taxation. I think they will have to understand that.

51. Do you favour the co-ordination of the primary and secondary systems—that is to say, placing them under one local body?—Provided that the secondary teachers would have a much wider outlook than they have now—that they would be eligible for inspectorships, for headmasterships of primary schools, positions in the training colleges, and higher positions generally.

52. Do you not think that that result would follow?—It should follow. The system should be one organic whole, if possible.

53. Would not that also lead to the primary and secondary teachers being brought more into touch with one another?—Yes. I think that one of the unfortunate drawbacks at present is the want of that touch.

54. At present the Superannuation Act provides annuities for both primary and secondary school teachers?—Yes.

55. Is it not probable that the primary and secondary teachers of New Zealand would form one association, such as the New Zealand Educational Institute, if the co-ordination were brought about?—That would be the natural result, I think.

56. *Mr. Hogben.*] In speaking of the cost of secondary education in England and Germany, did you not take Dr. Garnett's figures?—Yes.

57. Do they not include interest on the money borrowed for buildings?—I could not say. The figures are given in the appendix to the report I have quoted from.

58. Is that included in your £15?—There is another heading, "Cost of Maintenance." It is not clear from the report.

59. Did you take the New Zealand figures from Table K, in Parliamentary Paper E.–6, 1911, net income from endowments and cost per head, page 17?—The figures I gave were the amounts spent in 1910.

60. Do those figures include the cost of buildings?—I do not know that that is clear from the report.

61. What is the heading of the table?—I understand that the figures I gave were the expenditure on salaries and maintenance.

62. *The Chairman.*] Would you dispute Mr. Hogben's suggestion that they do not include buildings?—The figures I gave provide merely for the payment of teachers and office expenditure.

63. *Mr. Hogben.*] Do you know the definition of "net annual endowment"?—I do not. I find it very difficult to get a clear idea from the returns, owing to the extent to which technicalities are used.

64. Do you know that in Prussia the figures include building, and the interest on the loans for buildings?—No.

65. When you give Professor Sadler's opinion as to the average salary you quote from his Essex report, I believe. You say that the salary should be £300?—His statement is that the minimum salary of a secondary-school teacher in his prime should be £300.

66. Do you remember what he says is the actual salary?—I know it is very much less.

67. Is it as good as that in New Zealand?—Taking the actual money payment, I do not think there is very much difference. Taking the cost of living, I think there has been an improvement in recent years.

68. Have you any figures to show what the salaries are?—No.

69. You say that in Germany there is an average of from twenty to twenty-five pupils per teacher?—Yes.

70. What secondary schools have you taken?—I will give you several secondary schools.

71. Are you counting every teacher as teaching the whole time?—I am taking full-time teachers only.

72. Is there one teacher to twenty pupils?—Yes.

73. Dividing the number of pupils by the number of full-time teachers?—Yes.

74. Is that a fair way? Would it not be fairer to take the number of teachers available at one time, and divide by them?—I do not think so. Here is the case of the Realgymnasium at Weimar.

75. Is not the average time of that school thirty-two hours per week?—Yes.

76. What is the average time for which the teachers teach?—One teacher, the director, eleven to twelve hours a week; the teachers of classics, twenty hours per week; class teachers, twenty, twenty-one, twenty-two, twenty-two, twenty-three, twenty-one, twenty-two, twenty-three, twenty-three, twenty-one; the drawing teacher, twenty-four; the gymnastics teacher, twenty-four.

77. If you take most of those teachers it would be fair to say that they teach twenty-one hours out of thirty-two a week, or about two-thirds of the school time?—Yes.

78. What is the average number of teachers available at any one time?—It would work out at about ten

79. What is the average number in a class if there are 300 scholars and ten teachers are available?—Of course, it would be thirty.

80. Do not most of the secondary teachers in New Zealand teach the whole of their time?—Yes. The point I want to make is that the German schools have much larger staffs, and the individual teachers teach fewer hours per week.

81. Were you in the Musterschulen at Frankfort, or the Erste Realschule in Berlin?—No; they were in vacation when I was there.

82. Did you see classes in secondary schools?—Yes, in several places.

83. Are all the secondary schools in Germany as well staffed as the Dresden one?—In some of the schools, where the classes got up towards forty, they were divided into two sections for certain subjects, and given to two teachers.

84. Is not the Wyggeston School a very highly endowed school?—I could not say.

85. Do you know how many realschulen there are in Germany compared with gymnasien?—They were tending to increase when I was in Germany—both the realschulen and the oberrealschulen.

86. Are they anything like as numerous as the gymnasien?—They were not when I was in Germany.

87. Take the leaving examination in Germany: is it not a fact that one of the officials of the Department is present?—Yes.

88. What would correspond to that official in New Zealand?—The Inspector of the Department.

89. Is it not a fact that in our intermediate examinations, at which senior free places are awarded, the teachers, the headmasters, and the officials of the Department co-operate in making the awards?—Yes.

90. Is there any practical difficulty in that?—Absolutely none.

91. Do you think there would be any more practical difficulty about giving a leaving certificate?—There should not be.

92. I want to ask you very definitely about one point, because I shall probably suggest to the Commission that there should be further evidence about it: You say that in recent years there has been a falling-off in the general qualifications of the boys who come from the primary schools. Your own experience refers more particularly to composition. Have you kept any models of the composition of twenty or thirty years ago?—I was teaching it for some years, and I have a pretty good idea what it was like.

93. You rather think the composition now is not as good as it used to be?—During the last three or four years I have noticed a falling-off. The chief fault is that the expression of thought is not simple enough. There is too much straining after effect.

94. But go back a little more than that. That is a fault of style. Take the question of matter, and the power of expressing thought, without reference to style?—I think the matter is very fair. It is chiefly the style I complain of.

95. Then, excepting for the style, is there a falling-off?—I think not. Of course, the style is the great essential in composition.

96. But is the style at the age of thirteen or fourteen a thing that cannot be corrected?—Of course, it can. I notice a great improvement after one term.

97. *The Chairman.*] You say that on account of this weakness in composition, when the children come to you from the primary school, you have to devote a considerable portion of your time to work that should have been done in the lower school?—I think that is a fault.

98. If they came to you properly prepared, would not a better opportunity be given them for specializing later? Is specialization retarded? Would it not be jeopardized under existing conditions? Assuming that shorthand-writing and typewriting are required in the secondary schools, you would not commence them till the third year. Can they take on that extra subject under present conditions?—I think if we devoted more time to the mother-tongue and mathematics, or to a modern language, during the first two years, we might reduce the hours on those subjects, and teach shorthand and typewriting in one year, giving at least an hour a day.

99. Would you go so far as to say that it is preferable to devote more time to secondary subjects than to shorthand and typewriting at all?—Yes.

100. *Mr. Davidson.*] Is it not a fact that you are getting a different class of pupil into the secondary schools now from those who were entering a few years ago—that formerly you got only the cream of the primary school, in the shape of scholarship-winners, whereas now you get the free-place pupils, and many who have simply qualified by means of the proficiency certificate? Would not that account for the lowering of the standard of composition?—It might to some extent.

101. Would it not account for it to a considerable extent?—It might do so.

Henry William Cleary examined on oath. (No. 9.)

1. *The Chairman.*] Will you state your position, and the matter you desire to bring before the Commission?—I am Roman Catholic Bishop of the Diocese of Auckland, and a Doctor of Divinity. I am here to-day because I know that your Commission is willing to receive any criticism or suggestion that is likely to be helpful in improving our school system. I fully recognize how generally meritorious that system is in its methods of instruction, and how fortunate in its *personnel.* My criticism of it gets back to what, in common with many others, I regard as it fundamental defect. I think I may fairly be taken as representing in this connection the views of a large section of the people of this Dominion, and, among them, of many who

are skilled in the principles and methods of education. But first I desire to point out two surface anomalies in the system, in so far as it affects non-State secondary schools: (1.) Maori children are allowed to take out scholarships in private secondary schools under Government inspection. This reasonable and proper right has not yet been generally extended to the children of white parents. (2.) Section 67 (2) of the amended Education Act of 1908 reads, in regard to Board and Private Scholarships: "The holder of any such scholarship shall receive the amount of his scholarship only so long as he prosecutes his studies to the satisfaction of the Board at a secondary school, or its equivalent approved by the Board." I am advised that the "equivalent" school here referred to may be interpreted to mean any secondary school, public or private, of an educational standing approved for this purpose by the Board. I am, furthermore, informed that this subsection of the Act is, in practice, so interpreted in the case of two large private secondary schools in this Dominion—one at Wanganui, the other at Christchurch. Thus far we have been unable to secure the application of this interpretation, under any conditions, to any one of the many excellent secondary schools conducted by Catholics in New Zealand. However, if the term "equivalent" in this connection should be deemed to be ambiguous, or if it should not fairly bear the meaning alleged to be attached to it in two particular cases, I suggest that this and the corresponding sections of the Act should be so amended as to make scholarships available, as a matter of course and right, at all secondary schools that are open to Government inspection, and, educationally, up to the Government programme. This remark also applies, *mutatis mutandis*, to free places. The suggested amendment of the Act would bring New Zealand into line with New South Wales, Victoria, and Queensland, where both the Government schools and the private schools have mutually benefited by a healthy and generous competition. I now refer more particularly to primary schools. It is a sound principle of statecraft that taxes which are levied from all should, in some shape or other, be used for the benefit of all. In the matter of public instruction we in New Zealand do not follow that golden rule. Our Catholic schools and many other religious schools long formed a part of the State system. We did not withdraw from that system. We were excluded from it by Act of Parliament in 1877. To many of the legislators of the time that measure was a well-intentioned effort to secure what is an absolute impossibility in any system of education—namely neutrality in regard to religious faith. Now, I wish to direct the particular attention of the Commission to the most serious and radical defect in the public-school system. The religious schools were not alone excluded by Act of Parliament from their previous standing as public schools, but they were excluded on what is, in effect, a dogmatic religious test. This test is supplied by sundry views of religion—by sundry religious dogmas—which constitute the foundation of the secular phase of our Education Act. I will here mention only two of these underlying dogmas. The first is this: that religion has no necessary or useful place in school training. The second dogma is this: that a political majority has the moral right to exclude religion from the place which it has occupied from immemorial ages in education. Take away these dogmas and you sweep aside the foundation on which the secular phase of our Education Act is based. I will not take up the time of the Commission by pointing out certain other dogmatic views of religion which are also implied in our secular-school system. But we have here what is tantamount to a State creed—a creed of not many articles, but a creed which, within its limits, is as dogmatic as the agnostic creed or the Nicene creed or the Westminster Confession of Faith. Moreover, our Education Act has, in the schools, established these dogmatic views of religion, and endowed them at the common expense of all. It has extended no such privilege to the many who cannot in conscience accept these dogmas. In view of the compulsory clauses of the Act, and in the absence, over wide areas, of an alternative system, the only alternative for dissidents are the following: they must either do violence to their conscientious convictions or they must pay for the educational system which their conscience demands, and at the same time pay in taxation for the system which their conscience rejects. Here we have in practical working what I have already described—a system that, in effect, allots educational taxation on what is, fundamentally, a dogmatic religious test. We respect the motive of those legislators who desired to establish a course of public instruction uncoloured by religious views, so far as that motive may have been dictated by respect for the religious susceptibilities of pupils. But the legislators have obviously failed to establish a system objectively neutral in all that concerns religion. In fact, objective neutrality in this connection is as much an impossibility as a square circle. This impossibility (as I have shown in recent publications) arises out of the very nature of the case; it is evidenced by the declarations of many leading educationists, and by the frank admissions of the standard-bearers of the purely secular system in the country in which it took its rise. So true it is that if you throw one set of dogmas regarding religion out by the school door, another set will immediately come in by the window. On the part of a large section of taxpayers, I would press upon this Commission the need of according the same general educational treatment to the consciences that cannot as to the consciences that can accept those views of religion upon which our Education Act is based. A very considerable body of people in this Dominion hold the following views of the place of religion in education: They hold to the old and more generally accepted doctrine that religion is an essential part of all education properly so called. They believe that education is a vital and continuous process, proceeding on essentially uniform principles both in the home and in the school, which is merely an extension of the home. They believe that it is a grave educational error to expose the child to opposite educational influences in the school and in the well-regulated home, as, for instance, by treating his moral and intellectual faculties as if they were so many watertight compartments. They hold that the State is not above or beyond the reach of the moral law, that it has not a radically different aim from that of the individual, and that the child's high capacity for religious and moral growth is, when duly developed, of enormous value as a national asset. It therefore seems to us that, even from the patriotic viewpoint, it would be a calamity for any school system

to leave, by however indirect a manner, upon the mind of the child the idea that religion is a matter only for the home and the church, or that it is a matter of secondary importance to arithmetic as a preparation for life, or that sufficient codes of personal conduct can be formed apart from the inspiration and the sustaining power of religion. I do not ask the members of this Commission to share these views of religion in education. I merely ask them to recognize the fact that these views are widely held in this Dominion. For us Catholics these teachings are as the very marrow of our lives. The case between the State school and the unaided private school is, in its last resort, a case of dogma against dogma. The fairest and most statesmanlike way is for the State to recognize in a proper and practical way that there are other views of religion in education besides those for which our present Act provides. We ask only for equal treatment of consciences in education. I know that this would present certain difficulties; but the difficulties are superficial; New Zealand statemanship has met and conquered greater; and Canada, Germany, Belgium, Scandinavia, and many other lands show that, given good-will, we also may arrive at a just settlement of this radical defect in our education system.

HERBERT ALBERT EDWARD MILNES examined on oath. (No. 10.)

1. *The Chairman.*] Will you state your qualifications, and the points you desire to bring before the Commission?—I am a Bachelor of Science of London University, and Principal of the Auckland Training College. Before entering upon the question of the training of teachers, I should like to say, as a taxpayer, that I came from England six years ago, and I have now lived in New Zealand long enough to understand its system of education, and I say emphatically that I think the public are getting their money's worth, particularly in regard to primary education. I think the primary education given in this country compares very favourably indeed with what I have been accustomed to at Home. I should not like to say anything which would give a wrong impression, but I do not think there is very much to find fault with. I think, as a taxpayer, apart from my position as a teacher, that things are very satisfactory indeed. The only thing upon which education experts agree is to disagree. One finds all variety of views. One man holds that Latin is absolutely essential to education; another is equally emphatic that Latin is waste of time. But there is one thing that all agree upon, and that is that the teacher is the pivot of the system. If you can get capable teachers—men of good character, and exercising good influence over the scholars—your syllabus can take a very secondary position. Get good teachers, and the rest can almost be left alone. There have been all sorts of systems in England. Most of them are forgotten, but we remember men like Arnold and Thring. Here in Auckland I was struck by the fact that there was once a master, Mr. Worthington, at the school in Wellesley Street. He was evidently a man of character, and he left his mark on the city in many ways. That only emphasizes the fact that after all it is the teacher that matters. That being so, is it not important that we should see in training our teachers that the students have the best models placed before them? The Auckland Normal School is a school of about 450 or 500 scholars, and it exists for the purpose of enabling the students at the Training College to get practice in teaching. That being so, is it not necessary that every teacher in the school should be a picked teacher to act as a model to the students—the best teacher you can get in the province? Have we the best teachers in the Auckland Normal School? I do not wish to say anything derogatory to the teachers who are now in the Normal School, but any one who knows the position will agree that there are many good teachers in the province who are not in the Normal School. Why not? Because they find the salaries offered too small. For instance, in the scheme for salaries the teachers in the Normal School receive from £90 to £420 a year. The veriest tyro who begins as a teacher in a backblocks school can get £90 a year without any qualifications whatever. Yet we are supposed to place before the students teachers at £90 a year, who are to be models to those students in their practical work. Similarly, there are teachers receiving £120 and £130 a year. There, again, although I have no fault to find with the salaries for ordinary purposes, I say that to give these salaries to teachers who are to act as models to the students seems to me unwise. You are expecting too much from the teachers for the money. It is like spoiling a suit of clothes for the sake of a few buttons. If means could be found to provide a little extra remuneration to the members of the lower grades of the staff the system would be vastly improved. The next question is whether one normal school is big enough to provide training for 100 students. The colleges, according to the regulations, may hold 100. Our school has, roughly, from 450 to 500 scholars to provide 100 students with the means of practical training—that is to say, one student has five scholars to deal with. That seems to me insufficient. I think it would be far better if, at any rate, one more normal school were established. Or would it not be better still to formally recognize what I might term the Auckland system? The Auckland Board adopted a scheme of this sort: the Chief Inspector recommended the names of picked teachers in the city schools. These were all seen at work and approved by the Principal of the Training College, and they were asked if they would be willing to allow one or two students to observe them at work. The assistant teachers who were asked and the headmasters of their schools very kindly agreed to do that without any remuneration, and it is greatly to their credit that for the last two years those teachers have been willing to take in each case two of our students and have them in their class-rooms, allowing them to watch the work, and exercising supervision over them. It seems to me that that is an excellent scheme. It is in practical working-order, and I may say that Mr. Wells, who is a member of the Commission, is headmaster of one of the schools in which it is in operation. If a little money could be provided for the remuneration of these assistant teachers it would put the matter on a proper basis, and more could be expected from them than is expected now. It would not involve much more expense, and it would mean much better provision for the training of teachers

than is available under the official system. The two points I wish to make are—(1) that the salaries of the junior teachers in the normal schools should be increased, and (2) that latitude should be given to the Boards in the matter of providing practice for the students. The next point, which is partly connected with these, is that there are a great number of uncertificated and incompetent teachers in the small backblocks schools. It has been brought under my notice in this way: a student has applied to enter the Training College, and has failed in his Matriculation or partial D Examination, which had he passed would have allowed him to enter the college. Having failed in that examination he is unable to enter a training college, and yet so short of teachers is the Board that he can get an appointment as a teacher of a backblocks school or as assistant in a town school at £90 a year. It seems to me that is an unfortunate position. I am not blaming anybody; it is simply because there are not enough teachers to take up these positions. I would suggest that it might be a good thing to see if something could not be done in the way of importing English teachers. Last year a number of the training colleges were overstocked in England, and many of the students could not find appointments in schools, so many of them had to go into offices and do ordinary work. These were trained teachers of good qualifications, and I am quite sure that if their fares were paid many of them would be willing to come out here for the experience and wider outlook which the visit would give them. They need not stay permanently; they need only stay until such time as teachers could be trained in sufficient numbers in the Dominion to supply the vacancies. The next point is that secondary teachers should be trained. That is brought home to me particularly at times by the students. All our students come from the secondary schools, and their criticism of the secondary schools, speaking generally, is that the teachers hear the lessons, particularly the home lessons; but that they do not teach. The students of the secondary schools are very largely left to themselves, but they are set home lessons in great quantity, and the teachers' work is chiefly to test this work, and not so much to teach. Of course, I do not know if that is a fair criticism, but that was told to me by students recently. I would suggest, if that be so, that home lessons, instead of taking the form they do now of preparing work that is set and should be done in school, should take the form of reading standard English authors. I will tell you why. I have 100 students, and the other day in a lecture I had occasion to use the name "Dominie Sampson," and in the course of the talk I asked the students the book in which that name occurs, and out of my 100 students, nearly all of whom matriculated, only three had ever read the book in which that name occurs. It seems to me unfortunate, to say the least of it, that that condition prevails now. The only suggestion I can make is that more time should be given by these secondary-school pupils to reading at night. If they have home work they have no time to read, and I think they should have their nights for reading standard English works. If they have not read these works they really cannot appreciate a newspaper. I mean to say that if the great majority of my 100 students had seen Dominie Sampson referred to in a newspaper they could not have appreciated the reference at all. So I think if secondary-school teachers were trained and therefore were able to teach more in school, the evenings of the children could be set free to do reading, which seems to me absolutely essential for the proper understanding of ordinary life. Mr. Mahon agreed with the need for the training of secondary-school teachers. The scheme is a good one; with the allowances that are given to students they may enter a training college and have experience there. The only thing that seems to be necessary is that the Boards of Governors should begin to demand trained teachers. No extra machinery is required so far as I can see if the Boards of Governors would say, "We must have trained teachers." Then those students at the University who have graduated and wish to teach in the secondary schools would have to enter the training college for a year. I would like to say a word or two about one or two points that have particularly struck me. First of all, in the primary schools I think that physical culture requires more attention. I do not know that I am exaggerating the position, but in Auckland City, at any rate, I think there is no scheme of physical culture. There is a scheme in the syllabus of course, and in every school physical culture is taught, but I do not think the teachers really know what they are teaching. There are a few enthusiasts here and there who understand something about it, and, of course, are doing good work, as enthusiasts always do wherever they are; but, speaking generally, the teachers in Auckland know little or nothing about physical culture, and little or no attention is given to physical culture. The time is put in, but not in an understanding sort of way. I was talking to the first assistant of a city school not long ago, and explaining something about physical culture, and I said that in training he should teach the boys to hold each nostril alternately while he inhaled deeply to make sure that adenoids did not block the passages. He replied, "What rubbish. I would no more allow my boys to make fools of themselves like that than I would fly." I do not know whether the Commission is aware of it, but latterly a great amount of attention has been paid to this matter in England. A Commission was appointed some years ago to draw up a scheme of physical culture. This can be obtained in pamphlet form at a cost of 9d. This Commission drew up a careful syllabus which is self-explanatory, and diagrams are given of the exercises required. If that were introduced into New Zealand any teacher of ordinary intelligence, with a little help from a supervisor who could go round and organize the teachers and give them talks on the work, would have a fixed scheme of physical culture, which has been agreed upon by people in England, almost as good as you could wish to get. It seems to me that two organizers would be required—a man and a woman, who should have expert knowledge of the subject. I think they should first of all be teachers. The great trouble with physical-culture experts is that they are usually just gymnasts or military men, and the first essential, it seems to me, is to have a teacher who understands child-life; he should be a man of University education. The fault of the physical-culture teaching in the past has been that it has been given by a man with just a big chest or muscle, and he has been allowed to run riot with the children. I think more attention should be paid to the physical side of children's education generally.

Supposing there were two classes of efficiency, A and B. Those children who showed good chest-capacity, and had showed attention to health and had gone in for swimming and life-saving, should get a certificate of proficiency of Grade A; and those who had not passed the physical test, but had merely passed a mental test, should only get one of Grade B. It seems to me that would be an excellent thing to lift up the attitude of the people at large towards physical culture. Everybody should be healthy, and very few are, speaking generally; and I think if people paid more attention to this work in schools they would be doing valuable service, because it would react so much on the mental side. Of course, healthy people are those who always do the best mental work. Another thing I would like to mention is the question of bursaries for travelling. So far as I know, there is no definite scheme here for young teachers who are anxious to improve their outlook to go abroad. There has been some talk at various Conferences with regard to an exchange of teachers, and I think it might be a good thing if specially selected students who have been through the training college and been teaching in a school for several years, could have their fares paid to England or to some other country. They could teach while over there, because that is the best way to find out what is going on in educational work, so that no maintenance would be required while they were away. I would suggest that they should sign a bond to come back to New Zealand and teach here, so that our children may have the benefit of their wider experience. It seems to me that would be an additional incentive to teachers. At the present time the conditions are not so attractive that good men will stay in the profession, and if an inducement of this sort were held out to them I think they would work more willingly. I have one other suggestion, and it is in connection with nomenclature. I would like to see used, instead of the word "Inspector," the word "Adviser." I think "Adviser-General" would sound just as well as "Inspector-General." When I first came here I was struck with the way the word Inspector was used—Inspector of Police, Inspector of Noxious Weeds, and Inspector of so-and-so. Inspector implies looking for something wrong, and I do not think that is just the spirit we should have in connection with education. An Inspector does not go to a school to ferret out faults there, but rather to advise the teacher, and help him in every way. I think if the word "Adviser" were used it would create a better feeling, and would be more in accordance with the modern attitude of Inspectors towards the teachers of schools. Of course, you cannot compel people to use the word "Adviser," but it might be used exclusively in official documents. Similarly, the indiscriminate use of the words "school" and "college" leads to much misunderstanding. When I first came here I was particularly struck with the class of children in the Normal School. I found there the children of doctors and lawyers and professional men generally, and I was very favourably impressed by the fact that the people as a whole were quite willing to use the primary schools for the education of their children; but it seems to me that there has since been a deterioration in this respect. Class feeling has sprung up, and private secondary schools and colleges so-called, such as King's College, have grown very largely since I have been here, which seems to indicate that people prefer to send their children to these private class schools. I think it is unfortunate it should be so. I think our primary schools should give the best education, and that everybody in the community should be willing to send their children to them. The word "college," it seems to me, is misused altogether. These private schools usually call themselves colleges, and the ordinary parent who does not understand thinks that the college, so-called, is a better institution than a school. I think it would be far better if in official documents all schools should be called plainly schools, and that the term "college" should be reserved only for the four University Colleges. The training college, I think, is wrongly named. I think it should be a school of teaching, just as one talks about a school of mines. I think confusion would be avoided if this system of nomenclature were adopted in all official documents.

2. *Mr. Davidson.*] You stated you had 100 students: is that the number in the other three training colleges?—I think so.

3. Do you know if your plan of providing practice in teaching is that adopted in the other centres?—No; the plan of having a normal school, of course, is, but not the plan of having picked assistants.

4. In your opinion, the providing of one normal school in each centre at which students may get practice in teaching is insufficient?—Well, insufficient as it stands by itself; but if the plan we have in Auckland of using these other assistants were adopted, it may be sufficient.

5. You spoke about the advisability of providing bursaries for sending New Zealand teachers to other countries, and you mentioned England particularly, and suggested that these teachers might be employed there in teaching in different schools and receive salaries. Seeing that there is an oversupply of teachers in England at the present time, do you think it would be possible to do that?—Quite possible, because just now there is a strong feeling in favour of New Zealand, and I think the people at Home would be willing to do anything to favour New Zealand people. I am quite sure, if the New Zealand authorities took action in the matter, it might be arranged. Of course, it might lead to an exchange of teachers.

6. You spoke of English teachers being imported to supply the deficiency at present existing in New Zealand: do you think that if these teachers were sent to out-of-the-way schools they would be likely to be contented?—I think if the whole thing were properly explained to them before they came out, and they knew exactly the conditions under which they would work, they would not be discontented. I have had to do with two English teachers who wrote to me on this point. I told them very plainly what the facts were, and I put the case to them as badly as I could; however, they came out here, and they went to backblocks schools, and they like the work very much; in fact, they are delighted with it. If that has happened in two cases, I do not see why it should not happen in others. All that is necessary is that the position should be properly explained to them before they leave.

7. You spoke of physical instruction, and of its neglect in Auckland?—I did not say there was any neglect. What I referred to was the want of training in the teachers who are giving the instruction.

8. Are these breathing-exercises not being generally done in the schools in Auckland?—I think they are, but I do not think they are understood by the teachers to a large extent.

9. Have they instructors in physical education?—No; no particular instructor. There is no systematic scheme of instruction at all. Of course, the Inspectors look after the matter, and do what they can, but I think it is advisable to have a definite man. In Edinburgh there is a Director of Physical Instruction, and he has ten assistants, who do nothing else.

10. Are you aware that in some districts in New Zealand this systematic instruction is given?—Yes.

11. And such a system ought easily to be possible in such a very large district as Auckland?—Yes.

12. You have a large number of your students who sit for the C certificate at the end of the year?—All of them.

13. Have you anything to say in regard to the new regulations for the examination and classification of teachers?—No; except, of course, that I partly indorse them. I think they are on right lines. There are great difficulties in the way of teachers—not in the city—who cannot get practical science. The syllabus aims at making the work practical, and that, I think, is right.

14. Do you think it is possible to give eighty hours a year to the training for this?—We have arranged to give it; it is quite possible.

15. Without neglecting other work?—Well, if you did not give eighty hours, you would be giving more attention to something else. You can do anything you have to do.

16. What do you say if the principals of other training colleges assert that this is an impossible condition?—I would advise them to come to Auckland, and I will show them how we do it.

17. Did you see these regulations before they were issued?—No.

18. When did they first come into your hands?—We did not get them until the beginning of March.

19. After you had drawn up your scheme of work?—Yes; we were working on the scheme of work of last year until they came out.

20. Do you think it would be advisable, before issuing regulations of this kind, that the principals of the training colleges should have an opportunity of seeing them?—I would very much appreciate the opportunity of talking them over. Personally, I give up my life to my work; it is a hobby with me as much as work; and if that is only recognized, and people are willing to consult me, I will work all the harder. But if I am simply used as a tool, and told to do this and that, I do not like it.

21. *Mr. Kirk.*] Are there physical-training exercises apart from the junior-cadet work in the schools?—Yes.

22. So you have a distinct part of the week set apart for physical exercises?—Yes, which are limited in most of the schools to a quarter of an hour in the beginning of the day.

23. Is not the junior-cadet work largely physical exercises?—As far as I can make out, the chief work done by junior cadets is to dress up and walk about. Personally, I do not think they do much good. It is well to have them organized, and nice to see them marching and holding reviews; but I think there is far too much walking in line and forming fours. What is the use of all this marching? It is so unintelligent; and the students who have been through the course all think the same thing. They soon learn how to stand and form fours, and they want to learn something else.

24. Is that the highest form of drill they get?—They do some fixed definite exercises in addition as part of the cadet work.

25. What are these exercises?—They have been trained by military men, who do not know anything about children, and they are not good exercises.

26. There is a system of physical exercises, then, included with junior-cadet work, which system you condemn?—Yes.

27. On the grounds that it is not in accordance with scientific principles of physical training?—Very largely. It has been drawn up by military men, who do not understand child-life; that is my personal opinion, after looking into the position very closely, and giving it careful consideration.

28. The physical exercises given by the instructors to the junior cadets, then, are really harmful in your opinion?—Well, perhaps that is expressing it rather strongly; I would agree it is partially harmful

29. And ought to be revised?—I think so.

30. With regard to what you suggest as to the A and B Grade certificates, you have in your school, I suppose, brainy boys and girls who yet are to a certain extent handicapped by reason of ill health?—Yes, because they have not paid attention to physical culture.

31. Or because of their environment and heredity?—If they are properly trained in the school you can overcome that to a certain extent. If a boy takes a pride in his carriage, and wants to have a big chest, he very soon begins to improve.

32. But, assuming all you have said to be the case, is it not a fact that you would still have briny boys and girls who are physically deficient, notwithstanding all their efforts to make themselves right?—Perhaps I had better explain that I do not want to get a big burly boy. All I want to imply is that a boy should make the most of what he has, and not neglect what he has. You can go round the schools of Auckland, and see dozens of boys sitting hunched up over their desks, with pinched faces. If they were told to sit up, with their chests out, and were made to sit up, and

the furniture of the schools made them sit up, and their parents made them walk with an erect carriage, it seems to me we would build up a different race altogether. Carriage is neglected altogether now, except by a few odd teachers here and there.

33. In the case of those children who with the best of intentions cannot reach to this state of physical fitness, would not the introduction of the B Grade certificates rather discourage the John Ruskins of the future, for instance?—I think John Ruskin would have been far better if he has been able to swim as a boy instead of writing such a lot of rubbish as he did in his later years.

34. In respect to these children who are bright and brainy, and yet nevertheless are not up to the physical standard, would it not have the effect rather of discouraging them?—I will not admit they would not be up to the physical standard I would set. All I want is that every boy should have a body. He has a brain, and he should pay as much attention to his body as to his brain.

35. *Mr. Wells.*] I gather from your replies you would consider the individual's efforts to improve his body rather than the ultimate result reached?—Decidedly.

36. I think the students at the training college may be divided into two classes—those who have had experience of teaching, and those who have not?—Yes.

37. What is your opinion of taking into the training college students without experience in the method of teaching? Do you think it is wise?—Speaking generally, I think it would be far better if the students who come to the training college had some little experience in schools—say, two years as probationers. I think that would give them a chance to look round and find out if they are really likely to make teachers. On the other hand, I do not think the rule should be too rigid. I think the present scheme is a very good one, because certain people only find out late in life that they have any call to be teachers. I have had actual experience of men who have taken up teaching late in life after having done other work, and without having had any previous training at all, and the two men I have in my mind are doing as excellent work to-day as men who have had previous training. I personally would like to see the present system continued.

38. There are some pupil-teachers who fail to get admission to the training college through failure to get a certificate or pass matriculation: do you not think it would be better to allow them a chance rather than take any people without previous experience?—Well, if it came to the question, I suppose it would in fairness, provided they had an aptitude for teaching. I do not hold that a teacher should be a prodigy. I find in experience that some of the best teachers are dull, and their dulness makes them sympathize with the children.

39. You would not shut out a pupil-teacher who had done good work for a number of years because he had failed to pass the examination?—No, I would like to see them included in some way.

40. With regard to the practical work, you find that at the Normal School there is not sufficient scope for practical work. Do you consider that the pupils of the school suffer through the large amount of practising that the students have to do through being confined to practice-work at that school?—Of course, one does not like to admit that one's own institution is not the best, and I do not know that I am prepared to say that the normal-school children suffer in any way from the presence of the students, because what they lose in one direction they gain in another, because there is so much striving on the part of the students to give good lessons that the pupils get very much better teaching probably than they get anywhere else.

41. Continuity of teaching is an important factor?—Undoubtedly, and that is disturbed.

42. You were speaking of the importance of reading, and you were suggesting reading instead of home work in the secondary schools: what steps would you take to see that the reading was done?—I would set it as definite home work. I would get editions of standard authors, and would get the pupils to prepare a *précis* of whatever work they had read, and thus find out if they had read it and understood it.

43. You were speaking of bursaries for young teachers, to enable them to travel: do you not think it would be a good plan if it were a recognized principle that Inspectors should get a year off for travel?—I think it would be a very good thing; that is the custom in many countries.

44. You think that might well be recommended here?—Very well indeed.

45. On account of the way in which Inspectors are brought into touch with large numbers of schools, you think what they gained through travel would be made specially valuable?—Very valuable indeed. Of course, doubtless if bursaries were put into practice for young teachers they would in time become Inspectors, being picked students.

46. In your opinion, will these new regulations make it much more difficult for backblock teachers to advance themselves?—I should think it would make it impossible for them. They cannot do eighty hours practical work in the backblocks. This will cut them out of the service so far as I can see.

47. Will it make it much more difficult to get teachers to go into the backblocks?—I should think so.

48. Can you offer any suggestions at all for improvements in the present training-college course other than you have made?—I do not know that I can. It is an excellent scheme as far as I can see, and compares very favourably indeed with anything I have been able to read about or to come across.

49. *Mr. Pirani.*] You outlined to us a method adopted in Auckland in regard to training assistants: is anything done outside the training college but in connection with the training college for training teachers of small schools?—No; we are so fully occupied with the 100 students we have that we cannot do much more.

50. Is it not possible to have a system of special small schools selected by the Inspectors as what you might call observation schools, at which students, or teachers even, could attend on certain days or certain weeks in the year, and so get experience in regard to sole-teacher schools?—It would be possible, but not, in my opinion, advisable. I think a teacher should be trained.

51. I am talking about your students: would it not be possible to have "one-teacher" schools which are in charge of specially good teachers who would be recommended by the Inspectors as teachers under whom you could place for a certain portion of the year any of your students to get trained in the work of sole-teacher schools?—That exists already; that is part of the Normal School.

52. I am not talking about the Normal School now. For instance, there are parts of this district where the teachers cannot possibly come to the Normal School, and would it not be possible to devise some scheme by which under the government of the Normal School such schools could be utilized for training sole-teacher schools?—Do you not think that implies training as well as teachers? How long do you propose they should be there? I cannot see how you can train a teacher under at least two years. You might give a sort of veneer, but that is all. We can barely give a finish in two years.

53. Do you not know that there are hundreds of teachers in New Zealand who go into sole-teacher schools without a single hour's preliminary training?—I do, and I think it lamentable.

54. Do you not think a system such as I suggest would improve that sort of thing to some extent?—It would be better, but I do not recommend it. I think it would be better to have a properly trained teacher. If we cannot get a properly trained teacher, I admit your scheme is better than nothing.

55. In regard to importing teachers from Home, what would you do in this case—I might say it is our case: Suppose you import three teachers from Home, and two marry within twelve months?—I should not import them unless I had them under a bond. I did not go fully into the details, but I naturally imply a bond would be necessary, as in our own case.

56. Is there any process of law by which you could recover under a bond from a married woman?—No.

57. So the bond would have no value except a moral value?—Moral, of course. If a person knew that, they would not wish to break the bond.

58. You think it advisable, then, if anything is done in the way of importing teachers, that a bond should be entered into by them to put in a certain period of service?—I think so, decidedly.

59. *Mr. Hogben.*] In regard to new regulations for teachers, were not many of the things in the new regulations discussed at the last Training College Conference in 1910?—There was no mention made of eighty hours in practical science. They were discussed in a general way, just as we discussed the question that normal-school teachers in the lower grade should have higher salaries. That was carried twice by two Conferences, but nothing has yet been done.

60. That is a matter of money?—Yes.

61. It is true that the staff has been increased since the Training College Conference?—Yes, but, unfortunately, in the wrong way, to a certain extent. The assistants getting sufficient salary have got an increase, and the ones at the lower end have not been increased. This is only another instance of the fact that if we were taken into the Department's confidence probably we would prevent this sort of thing.

62. Do you think the regulations make it impossible for backblock teachers if the Boards had money enough to form special classes and to bring these teachers to the centres?—It would be quite possible then.

63. You think that would be necessary?—Absolutely.

64. *The Chairman.*] There are thirteen hundred schools in the Dominion at which there are more or less untrained and uncertificated teachers. You have told the Commission that you cannot give them the full measure of instruction. The new syllabus for teachers makes certain demands upon them, and you say it is impossible for them to fulfil these demands under existing conditions. How is this state of things to be remedied?—Only, so far as I can see, by increasing the number of training colleges. I do not think there is sufficient to supply the need. There are only four, which are turning out, on an average, two hundred teachers a year, and I do not think two hundred are sufficient to supply the schools.

65. In regard to the plan you pursue in the Auckland Training College of giving your probationers and pupil-teachers a chance of seeing what is being done outside, are you aware that in some parts of the Dominion the training colleges have had attached what are called associated schools?—I do not believe in these at all. I have had experience of them in England. The trouble in associated schools is that the assistants are not picked assistants. We do not take associated schools. We will take a school—say, the Devonport School—then pick out the best teacher there, and take him only as our model. We leave the rest alone.

66. *Mr. Wells.*] What is being done in the Auckland Training College in regard to the training of teachers to teach agriculture in our schools? Are you making any effort to do that?—Yes, we are compelled by our regulations to teach agriculture to all students in the training colleges.

67. Is any practical work done?—Yes, there is a garden attached to the Normal School.

68. What is the area of it?—It is not a very large one, but it has been found quite satisfactory. We hold you can learn as much from the growing of one bean as by the growing of an acre of beans. If the space is small but properly utilized, you can get all the practice and training you want.

69. In your opinion, the instruction now being given at the school is quite satisfactory?—Yes, I would say so without any hesitation at all.

70. *Mr. Davidson.*] Is it not a fact that many of these sole-teacher schools are now in charge of trained teachers?—Yes, undoubtedly.

71. And that many uncertificated teachers are to be found on the staffs of the larger schools? —Yes, undoubtedly. The plan of the Auckland Board is very largely to send out trained teachers into the backblock schools. It is part of their rules that every student must serve two years in the country before he can get promotion.

72. Suppose the Education Board, in selecting teachers for these sole-teacher schools within a radius of ten or twenty miles of Auckland, selected the very best teachers, would it not be possible to do as you do in the case of city schools—send your students for a shorter or longer time to these sole-teacher schools where excellent teachers are to be found?—We have already two schools attached to the Normal School—one a country school, taught by one teacher; and another a junior country school, taught by one lady teacher of particularly good qualifications. The teaching in that school is the same teaching that we get in the standards, except as to the problem of managing all the classes at once, but it is not necessary for the students to be there quite so long. If they are there a week they learn as much as they are probably likely to learn.

73. You think that the one sole-teacher school in connection with the Training College is sufficient for the 100 students?—We were also using the Mangere Bridge School at one time; that was a two-teacher school.

WILLIAM OLIVER LAMB examined on oath. (No. 11.)

1. *The Chairman.*] What are your qualifications and position?—I hold a C1 certificate, and I am headmaster of the Maungakaramea School. I am also president of the Auckland Country Teachers' Association.

2. What are the matters in the order of reference with which you wish to deal?—Speaking on behalf of the associaton, I would like to state that the grading scheme of the Auckland Board, though not recognized as a perfect one, has the confidence of the country teachers. Our reason for that confidence is this: Under the old system canvassing was rife, and in that respect the country teacher was distinctly handicapped. He was too far from the centre, and not in a position even to make the influence of his friends felt. He therefore welcomed a change that should be based on merit alone. I think the Auckland Country Teachers' Association was the first body to ask the Board to send only one name to the School Committee when an appointment was about to be made—that of the teacher standing highest on the list. That was in March, 1900. We were therefore exceedingly pleased later on to find that the Board had adopted that principle—the automatic principle. The four-name system had been proved unsatisfactory. In the percentage of marks one candidate might be removed from another by ninety or even a hundred places in the numerical order, therefore the sending of four names was ineffectual. Apart from that, the teachers knew in many cases the man who ought to get the position on his merits, and under the four-name system that man often did not get it. I have said that we do not consider the present scheme perfect. We should have liked to see not only the percentage of marks but the order of merit sent to the Committee, and we asked the Board for that concession, but the Board could not see its way to grant it. Nevertheless, when a motion was tabled hostile to the scheme the country teachers overlooked this defect. They felt that they were going to lose something if the scheme were pushed aside, and they reaffirmed their confidence in it. In any scheme of promotion, however, we consider that special marks should be given for service in the remote districts in the backblocks, because of the peculiar hardships of life in those districts, and his remoteness from the University College, and the benefits of tuition generally. Probably the greater number of the uncertificated teachers will, on that account, be found in the country. I may say that there are one thousand three hundred uncertificated teachers in the Dominion. If in any promotion scheme certain marks were allowed for a partial certificate, that would be an encouragement to the backblocks teachers to improve their status. I am not in agreement with those who would abolish the examinations for Junior National Scholarships and Education Board Scholarships, and substitute a Free Place Examination. I would be in favour of abolishing all three and making the avenue to secondary education a certificate awarded by the Inspector after consultation with the head teacher of the school. All teachers of experience know that many candidates are fitted to receive that certificate who cannot do themselves justice in an examination. I consider that secondary education should be free and accessible to all who are fitted for it. The chief avenue to it at the present time is the certificate of proficiency, and I would like to ask, What percentage of the candidates who are able to avail themselves of that certificate come from the country? There is considerable leakage and economic waste in the fact that the country children do not come to the secondary schools. We are told that this is essentially an agricultural country, and that our children should be given a bias towards the land. But what must be the feelings of a country parent who has a particularly bright child whom he is unable to send to a secondary school? It must be one of his bitterest regrets. I think that last year something like £10,000 was allocated for National Scholarships. If some of this were given to country children as boarding-allowances, I think there would be a great gain. I think the competitive system is entirely out of harmony with the spirit of the syllabus and with the spirit of modern education, and should be entirely wiped away. I contend, further, that the ability of many children is not discovered at the age of fourteen. As an ex-student of the Thames High School, I notice that many of my old schoolmates who have since been successful in life did not attain to positions of honour in the school. One of them, now a Doctor of Science, and successful in the practical affairs of the world, did not put his best foot forward until he was sixteen, while any number of men now successful were not winners of either Senior or Junior Scholarships. We may, in exalting early precocity, be passing over the child of average attainments. That is a question we should keep in mind. I think that the accrediting system might be a means of lessening

the cost of education in some small measure. If the best schools were given, say, two years freedom from inspection, and then the Inspector came along to adjudicate upon their work, there would be a considerable gain in the fact that the Inspectors could employ their time in the schools that had more need of their assistance. I think the question of the comforts and conveniences in country teachers' houses will be held to have a bearing upon the question of efficiency. Our association felt so keenly on this matter that two years ago they petitioned Parliament, and the teachers of other education districts followed suit. I believe that it was as a sequel to those petitions that a grant was made for the improvement of the teachers' surroundings, but this grant has proved inadequate. In this connection I should like to submit to the Commission this return which has been prepared in the Education Board's Office.

Auckland Education Board.—Conveniences to Teachers' Dwellings.—List of Improvements submitted to Department.

——	Wash-house and Bathroom.	Bathroom.	Wash-house.	Fittings to Wash-house.
Recommended to be carried out at once	19	18	4	42
Recommended to be carried out when funds available	10	8	6	14
Recommended to be deferred	30	10	..	12
Not recommended at present	12	6	..	4
Total needed	71	42	10	72
Authorized	13	17	1	6
Still needed	58	25	9	66

I should like the Commission to picture to themselves the schoolmaster's wife on washing-day, doing the family washing out of doors. Then remember that we are expected to teach the principles of hygiene, and the only example we can set to the children in our own persons is to seek the nearest creek for our ablutions. This matter has come up year after year at the Council of the New Zealand Educational Institute; resolutions bearing upon it have been carried unanimously, and sent to the Department, but the fact that it still has to come up annually is evidence of how inadequately it has been dealt with. Coming to the question of consolidating rural schools, I am entirely in sympathy with my association that it is desirable that there should be one central school with two or three teachers, instead of a number of small schools. It is true that in the Auckland District, where the roads are not perfect, that can only be done in certain parts of the province. The gain in economy must be obvious, and we would get a better class of teachers, for there would be more well-paid positions. Our Chief Inspector lately said that there were only sixty schools in the district with average attendances over 160. In the whole Dominion there are 196 with more than 160 scholars, and these are the prizes of the profession. The number of small schools up to and including thirty is 1,280 for the Dominion, and in our province there are 363 small schools. The great problem in any promotion scheme must be that there are not enough well-paid positions to go round. I think the children might be gathered for distances of ten miles if there were motor traction and good roads. This has been tried with success in countries like Victoria, Canada, and the United States. Another point is that I think teaching service ought to be counted beyond twenty years. The Auckland Board do not allow for service beyond twenty years. The ripe experience of the man who has been teaching beyond that period must be of value to the State, and some numerical value ought to be attached to it—say, half a mark per annum, or something of that kind. Recurring to the question of secondary education, I see no reason why a country child should necessarily have a classical education. I think a rural course might very well take the place of the ordinary secondary-school course, thus bringing the child into touch with his environment, and giving him a bias towards the land. The attention of the Commission has been called to certain anomalies in the staffing. I think there should be a subgrade between 36 and 80. I know of teachers who find their work very heavy indeed when their roll-number is in the eighties. It must be remembered that in that case the assistant would have something like fifty pupils, and perhaps more, in the three groups of primers, and Standards I and II: and the headmaster might have fifty pupils. There might be a very great difference between the average attendance and the roll-number. There is need for more elasticity in regard to the change of staffing from Grade 3 to Grade 4. Sometimes a school drops back to Grade 3, and yet may go back again to Grade 4 after having lost the assistant. The teacher would then be doing sole-charge work with a very heavy roll-number. I think there should be a change in the regulations whereby the change could be made more rapidly from 3 to 4—whereby such a school as I have mentioned could get an assistant again. Again referring to service in remote districts, I would like to state what is the practice in certain States. In South Australia there is an unwritten law by which service in the country is demanded of the men who are seeking promotion; in New South Wales from two to five years are asked of service in the country; in Queensland four years from male and two years from female teachers. The teacher who goes away from town and its advantages deserves especial recognition. Where the work of such a teacher commends itself to the Inspector it should be taken into account that he is doing it under grave disabilities, and special value should be attached to it. It is somewhat of a grievance with country teachers

that the free-book grant does not provide for the grouping of classes. In the syllabus we are recommended to group classes. It makes for efficiency if Standards III and IV are grouped for reading. If there are seven children in Standard IV and fifteen in Standard III you have only seven books for the twenty-two children. It can be readily understood what a difference that makes in the working of the school. I am a believer in the system of travelling libraries for schools; country children are not a reading class. The demands made upon them in the way of home labour interferes with their becoming so. But I think that if books were sent along that were continually changed the results would be good. I would be in favour of a good number of abridged books being sent. If a child became interested in the abridged edition he might then go to the complete book and continue his studies. With reference to Mr. Milnes's comments upon the cadet system, I think there is something more than marching and forming fours in the cadet work. I was in the cadets' camp, and I can speak from practical experience of the benefits of the system. I think it forms an excellent system of training in certain habits of neatness, accuracy, and punctuality. Over and above marching, there is training in such work as skirmishing, advancing over country, and taking cover. But I agree with Mr. Milnes as to the need for more attention to physical culture. In my school we have physical exercises and deep breathing every day, but I feel, and I think other teachers feel, that they need some training in the basic principles underlying this great question. I take it that education means a harmonious development of all the powers of a child, physical, mental, and moral. I remember the case of a successful Junior Scholarship candidate who had no inclination for play-ground games, and who later in life told me that he had failed to pass the test for chest-measurement when he wanted to enter the Civil Service, and he had to take his camera on his back and tramp the hills in the effort to increase his chest-measurement. I agree that we should have a robust boyhood and girlhood if we are to build up a virile nation. As showing the sympathy with which the country teachers regard this matter, I may say that in 1910 we notified the Department that we would welcome medical inspection of our schools. Regarding the inability of country children to attend secondary schools, the Principal of the Whangarei High School told me lately that out of seventy-six enrolled this year twenty had to board in the town. One boy is riding fifteen miles back and forwards in order to attend the school. I agree with those who hold that the salaries paid to education officers and teachers is inadequate when compared with the emoluments offered in other professions and in commerce. We should have the very best men for our Inspectors, and pay them the highest possible salaries. The system of appointment of Inspectors needs a certain amount of care. If the appointment of teachers is stripped of all partonage, why should not the same principle apply to the Inspectors, who have to direct the work, and who have the careers of the teachers in their hands. But that is not the case. I think, too, that the salaries of the country teachers call for revision, because the cost of living has gone up. Perhaps we have come to regard as necessities what were formerly luxuries, but we cannot control that altogether. The salaries in the case of many of the country schools leave a very small margin, and in many of the aided schools a living wage is not paid.

3. *Mr. Pirani.*] Do you think a teacher who teaches three or four children as a day's occupation should be paid a living wage for that work?—I do.

4. Where would you put the limit? Would you say that a teacher who taught one child as his day's work should have a living wage?—I think centralization of schools would remove that difficulty.

5. Is there anything to prevent centralization now?—In many cases there is not.

6. If there is not centralization of schools now, who is to blame?—I think local jealousies are a good deal to blame. It is regarded as a very desirable thing in each little village that it should have a school. I dare say it has a bearing on the value of the land.

7. But surely the village people have no control over the amalgamation of schools?—They have an influence on the Education Boards. They control and influence the elections.

8. What method would you suggest for dealing with the problem?—I warmly advocate centralization.

9. How should it be done?—By providing for the conveyance of the children.

10. But what alteration of the law would you suggest?—I should begin at the root of things, and abolish the election of the Boards by the Committees—have them elected on the general franchise. There would not then be local jealousies influencing the matter.

11. Do you know of any instance where an Education Board has desired to abolish certain schools and establish a central school in their stead, and has been prevented by local influence?—No; but I know of an organization of School Committees which I can easily imagine would have a considerable influence on the election of the members of the Board. Such an organization exists in the Auckland District.

12. Does it not come to this: that you are dissatisfied with the men who control education in this district in that respect—that you do not believe they have done their duty?—I think they have endeavoured to do their duty, but perhaps they have not seen it to be their duty.

13. In the classification of teachers, would you count service beyond twenty years without regard to efficiency?—Certainly not.

14. When would you say the limit ought to be?—At thirty years.

15. You would extend it ten years beyond the present plan?—I think so.

16. Do you not think a man of forty-five years of age is capable of improvement in his methods of working after reaching forty-five?—If you got beyond thirty years the marks so earned might have rather a preponderating weight; therefore we would be content with thirty years.

17. Would it not be a better method to give extra pay to the teachers who put in more than a certain number of years' service, regardless of the positions they occupied?—That might meet the case. I think it would meet with the favour of country teachers. I should like to emphasize here

the point that one effect of creating a new subgrade between Grade 4 and Grade 5 would be to provide a considerable number of better-paid positions. At present there are a large number of teachers who have no hope of getting past Grade 4. A glance at the list of 196 schools in the Dominion makes that obvious.

18. Have you had anything to do with correspondence schools belonging to proprietaries outside the Dominion?—No. There are some excellent institutions in Auckland, of which teachers take advantage.

19. Should there not be some kind of supervision by the Department or the Education Board over schools of that nature, to guarantee to the students that they get value for their money?—I think fair competition might be allowed there. Teachers pretty soon distinguish the shadow from the substance.

20. Is it not rather late for a teacher when he finds out that a system is a fraud?—They do not invest money in that way until after pretty careful inquiries.

21. *Mr. Wells.*] How are the new regulations as to the obtaining of certificates regarded by the country teachers?—A good many have expressed to me feelings of dismay. They do not see how they are going to fulfil the requirements.

22. Will their enforcement make country service still more unpopular?—I think that until facilities are provided by the Department for fulfilling the science course they are impossible. I rather favour the idea of making the teaching of science practical. I have had some experience of labaratory work.

23. Would it be an assistance to uncertificated teachers in the backblocks to be allowed to take their D certificates in three sections?—Yes, and I see no reason why it should not be done. It would be a distinct help to them.

24. As a country teacher, can you give us any idea of the extent of child-labour in the country districts in the way of milking and dairy-work? Is any hardship entailed in that way?—In 1910 the Country Teachers' Association drew up the headings for a return, which it sent to the country headmasters to be filled in. The headings were: "Age of Pupil at October, 1909"; "S. Class"; "Time of Rising and Time of going to Bed"; "Number of Cows milked—Morn., Night"; "Time occupied in this or other Home Labour"; "Distance from School"; "How Child travels to School"; "Regularity and Punctuality Attendance"; "Other Remarks—*e.g.*, Mental and Physical Condition of the Child." We found that in individual cases there was very great hardship. Some children were doing as much as six and seven hours' home labour and travelling several miles to school, arriving in an altogether jaded condition, which would make them by no means receptive, and would influence their school-work. We recognized that the prosperity of the Dominion was based on its agricultural and pastoral resources, so we approached the question in no spirit of antagonism to the settlers. We simply wanted to know. In some cases there was no hardship at all—simply the milking of two or three cows—but in other instances it was nothing but child-slavery.

25. Has your association any suggestion to offer as to how the difficulty might be grappled with?—We talked it over a good deal, and thought that the advent of the milking-machine would remove it. A good deal of the home labour, however, consists in cleaning the separators, and work of that kind. Still, the introduction of the milking-machine will remove a good deal of the trouble.

26. Would you advocate the appointment of Inspectors from the teachers' graded list?—Yes.

27. Might not a man be a very highly qualified teacher, and occupy a high place on the graded list, and yet be quite unsuitable for the inspectorate?—That is possible, and would have to be taken into account; but still there could be attention to the list too.

28. *Mr. Kirk.*] Do you go the length of suggesting that secondary education should be compulsory?—I would. I do not necessarily mean classical education. I would say that the country boy should compulsorily attend classes in rural education—follow a rural science course, for instance.

29. Do the School Committees attend to their duties in regard to school buildings satisfactorily?—They endeavour to do so.

30. But do they succeed?—There is often a breakdown of the system with regard to sanitation. A teacher often has to wait upon them with an urgent request. I think it would be a very happy thing if we could improve the conditions in that respect.

31. It is a really serious matter, in your opinion?—In some cases.

32. Is proper attention paid to the fumigation of the school itself?—I do not think fumigation is carried on except after epidemics. No periodical fumigation is undertaken, in my experience. There may be cases, but I do not think it is a general thing.

33. Is the ventilation of the schools satisfactory?—I think so. I think the character of the schools has improved wonderfully in the last twelve or fifteen years.

34. Are you of opinion that the teaching of sexual physiology is desirable?—I am; but I think it should not be carried on by the teacher, but should be left to some one with a decided sympathy with the child nature.

35. *Mr. Poland.*] Can you give an instance where, in your opinion, centralization could well be carried out in the Auckland District?—It might be well carried out in the Thames centre. The schools there are very close together.

36. How many schools are there in that district?—The Tararu, Waiokaraka, Baillie Street, and Parawai, all within four or five miles.

37. Should the whole of those schools be combined into one?—Into two, possibly.

38. What limit would you place on the number of scholars to get the best results?—A school of 500 can be very efficiently managed.

39. What is about the attendance at the schools you have named?—The Baillie Street School will have an attendance of about 400.

40. Well, could you do much centralization at the Thames under your proposal ?—I said it would be a great desideratum to have schools of 500 ; but I would go further, and say that you might have schools organized with one headmaster in charge of several. I think there is a good deal to commend that system.

41. Would it not reduce cost and increase efficiency to have one headmaster over a number of schools ?—If the schools were not built for over 1,000 children in the first place. If schools were built on modern lines, probably 1,000, or at any rate 750, scholars could be well dealt with.

42. Do you know of any other district where centralization could be applied ?—I think it might be practicable in some of the districts of the Waikato, along the railway-line.

43. Do you think the money spent on the purchase of free school-books is wisely spent ?—I think it might be much better spent on stationery. There is a great disability in the fact that the children cannot take the books home.

44. Do you think the money expended now is wasted ?—A considerable amount of it is wasted, because the books are duplicated. Reading-books are bought by the children in addition to those supplied. I think I can say in favour of the system that it has done a good deal in extending the children's reading. The supplementary readers give them a wider range of reading.

45. Have you a library in your school ?—Yes.

46. *The Chairman.*] Is it supplemented from time to time ?—No. I think the system in connection with the libraries is one grant. I think a regular subsidy would be a gain.

47. *Mr. Poland.*] Would not a travelling library obviate that ?—Yes.

48. *Mr. Thomson.*] You think secondary education should be compulsory ?—I should like to see it compulsory up to the age of seventeen, and be of a vocational nature.

49. *Mr. Davidson.*] Do you know of any part of the British Empire where more liberal staffing is in operation than that allowed in New Zealand in the grade where you now propose a subgrade ?—No ; but New Zealand leads the world in most things, so we may have a little hope in that.

50. In a school of seventy-five, would there not be at least thirty-five in the preparatory classes and Standards I and II ?—There would be more than that ; nearer fifty.

51. That would leave only twenty-five in Standard III and upwards. Surely you will not contend that there is great difficulty in the headmaster having twenty-five scholars to deal with ?—But the foundation work of the school is laid in the infant classes. If the headmaster did not get assistance, the infant mistress or woman assistant should have it.

52. I do not admit that there would be fifty in the preparatory classes and first two standards ?—I have known a roll-number of forty-three out of sixty-eight.

53. What class of school do you consider most easily worked below Grade 6 ?—The school where the attendance is just over thirty-six.

54. Is it not the general opinion of teachers that the two-teacher school is the pick of country positions ?—Yes, at one end, when it is near the minimum.

55. What is the attendance at your school ?—There are sixty-eight on the roll.

56. What percentage of the pupils provide their own books although the books are provided by the State ?—I was not speaking of my own school when referring to that matter.

57. Have you many free books stowed away in the cupboards unused ?—No. They use them in the school, but in some cases they purchased books in order to get up their spelling and reading work. I have heard of some schools where all the children have provided themselves with books.

58. Do you know that many teachers encourage the children to purchase their own books ?—Yes.

59. On the question of the conveyance of school-children to a central school, you had in your mind more particularly the country schools ?—Yes.

60. Would the plan adopted in South Australia be workable here. There any parent whose children live beyond more than three miles from school may be granted a daily allowance in order to take his own children to that particular school, the parent being entirely responsible ; the allowance is at the rate of 4d. a day for each child. Parents make arrangements for the conveyance, and take the whole of the responsibility ?—I think that system would be ineffective here. A farmer would not be able to do it. The better practice would be to delegate some one to do the work. The only way it could be done would be by the parents combining to get a trap.

61. *Mr. Thomson.*] It is in operation now ?—I was thinking of the dairy industry in our country districts.

62. The allowance in New Zealand is a minimum of 6d. per day for each child. The parent might get 2s. 6d. per week. Do you not think it possible that many parents would undertake the conveyance of their own children to school if they were allowed 2s. 6d. per week for each child ?—I think it would be a precarious system to adopt.

PERCY GEORGE ANDREW examined on oath. (No. 12.)

1. *The Chairman.*] What is your position ?—I am secretary of the Poverty Bay School Committees' Association, and also a member of the School Committee at Te Haka, a suburb of Gisborne. I have been on the Committee since the school was started some two years ago.

2. The Commission will be glad to hear you on any question raised in the order of reference ?—The School Committees' Association was formed in the district on account of the dissatisfaction felt with the administration of the Education Board. Our own school is a new school, which was opened last February twelve months. There was a guaranteed attendance at the outset of 156 children. The Board built a school to accommodate, roughly, 140 or 145. Twelve months after the school was opened the attendance was 220, but there was only accommodation for 140 ; so

no one could accuse the Board of great foresight in the matter, although it was obvious it was a rising and prosperous district with a tram service, and therefore that the attendance at the school was likely to increase. We started with a headmaster and a female assistant: The headmaster had Standards I, II, and III in one room, and Standards IV, V, and VI in another, and the female assistant took the primers and preparatory classes—comprising about eighty children—in another room; so that the headmaster had to divide his time between two rooms and six standards, and the assistant had to teach between seventy and eighty children, and at one time ninety. The Commission can draw their own conclusions as to the efficiency of the education. There are nine members on the Hawke's Bay Education Board—three for the Northern Ward, three for the Middle, and three for the Southern. As far as Gisborne is concerned, it is an isolated place, really in the Auckland Province, and the Auckland Board has a reserve there. Nevertheless, we are attached to the Hawke's Bay District, and send three members from the Gisborne end. The members from outside Gisborne would know nothing whatever as to the requirements of the Gisborne district. There is much wanting in the administration, and dissatisfaction is felt throughout our district. As an instance of their administration, right at the outset the Board sent us a nice flag to fly on special occasions. We suggested that they should subsidize us if we built a flag-pole to fly it upon, but we only got in reply a polite negative; probably they regarded a flagstaff as a luxury. Gymnasium and gymnastic apparatus, really a part of the requisites for physical culture at the school, were required, but these also were refused to us. We wanted the school grounds asphalted. It was sandy soil, and when there were strong winds there was a considerable erosion of sand, which blew through the windows; but we were told if we wanted asphalt we should have to dip our hands into our pockets, and then the Board might subsidize our expenditure £1 for £1. We have raised £30 or £40 during twelve months for the purpose of completing the building and making it a decent school, but here again we have had no encouragement from the Board. We consider that, with regard to new school buildings, there should be standard designs issued by the Department, and the matter should not be left to the discretion of the Board's architects. In one of our rooms the blackboards are at one end and the children are placed facing the light. The blackboard itself was of dark-green linoleum, which rapidly became of a grey colour. For my part, I should not like to have to read matter chalked on that board from some distance, as the children have had to do. The chimneys in the school would not draw, so that the windows had to be kept wide open, otherwise the room was filled with smoke; and on some occasions th rain has come in and flooded the school. The general design was not at all satisfactory. We wrote to the Board several times with regard to these defects, but the matter was not attended to. The foreman of works, I think, came out and reported, and then I believe the Inspector came along, and he also went back to Napier and reported. Then they got a price from a local man, which, I think, was considered excessive. The northern members were instructed to inquire into the matter when they came to Gisborne, and one of them came along and reported. The surroundings generally of the school did not lend themselves to efficient teaching. Then we have had other trouble with the Board. At the outset we suggested that the school should be equipped with single desks seeing that it was a new school, but the Board informed us that they were equipping it with the usual fittings, and they sent along the usual uncomfortable desks for the infants, and refused our application for dual or single desks. About six months after the opening of the school we had trouble with vermin, a thing which might have been obviated if our request for single desks had been acceded to. The school is not satisfactorily equipped so far as the infant department is concerned. There is nothing in the way of kindergarten materials, and for the upper classes there is very little in the way of scientific apparatus. We have also had trouble with the Board on the question of the appointment of teachers. One of our teachers, the senior female assistant, went away for twelve months. We recommended that the junior teacher be appointed to her position. But the request was ignored, and another lady was sent along to take the place of the absent teacher. She had had no previous experience in infant teaching, and yet she took charge of the infant department. We were not consulted in any way with regard to the appointment of the teacher, and yet, according to the Act, we understand that temporary appointments are only to be made for three months; for anything further than that there should be a consultation with the Committee. We are also badly troubled owing to lack of funds. We have been working on an overdraft for as long as the bank would allow it. The capitation is ridiculously insufficient. When you have paid the caretaker's salary and the coal bill there is very little left, and it is difficult to get the Board to grant us more than our bare allowance. It is even difficult to get a pound-for-pound subsidy upon the amounts we raise by entertainments. Personally, I think the Boards might very well be wiped out without any loss to the education system. I do not see that they serve any useful function that could not be performed by the Central Department or the local Committee. As to whether we get the value for the money expended by the State on education, I should certainly say we are a long way from getting it. Comparing education here with education in the Old Country as I knew it from ten to twenty years ago, I should say that the education here now in the primary schools is about equal to the country-school education in England as I remember it twenty or twenty-five years ago. The children are taught in a parrot-like fashion *en masse*, and they get very little in the way of kindergarten instruction. Knowledge is just hammered into them at express speed from an overloaded syllabus. They get a mere smattering of everything and a good knowledge of nothing. Again, with regard to the system of education—I am speaking now about wiping out the Board—if you take the average city or suburban School Committee in Auckland, and compare the members with the Board members, anybody will admit that you will get a better body of men on a Committee like that of Devonport and Ponsonby than you will get on the Auckland Education Board; and therefore why the Committee's functions should be limited just to seeing that the sanitary arrangements are properly carried out, and to meeting once a month and spending 2s. 3d.

on stationery and so on, while the Boards are given such practically overruling functions, I do not know. In an ordinary way I would sooner trust to a School Committee than I would trust to a Board, because it is composed of the parents of the children who attend the school, and who have the interest of the school at heart. Yet a Committee composed of these parents is overruled and ignored and treated with contempt by a Board situated 100 or 180 miles away, the members of which probably have never seen the school or district. That seems to me a very absurd position. Indeed, it is very difficult for me to imagine a worse one. First of all, I should say the Boards could be wiped out without any loss whatever. They do not perform any really vital function in the education system of this country. The employment of Inspectors and the classification of teachers could be done by the central office in Wellington. All the waste that now takes place could be avoided by giving control to the Department, with local control by the Committee. But there is one thing I wish to say in regard to the functions of the Committee—I do not suppose Committees generally will support me—I do not think School Committees should have anything whatever to do in the appointment of a teacher or with the control of a teacher. I have taken a bit of interest in teaching, and I think there should be some means by which the Head Department could classify each grade of teachers and appoint them to positions purely on merit. In the case of equal merit I would let the appointment go by seniori y. I would let the Department in Wellington employ the Inspectors. I think it is a wrong principle that a Board should employ both teachers and Inspectors. The Inspectors cover the same ground in our district year after year for perhaps thirty or forty years. Now, Inspectors are only human, and they get their likes and dislikes. If the Central Department or Board in Wellington was employing them you would probably have an Inspector in Southland this year and in Auckland next year, and so on, and that Inspector would be much more likely to give an absolutely unbiassed report and judgment than an Inspector who is going the same old round year after year. Again, there is always trouble cropping up between Committees and Boards in regard to the selection of teachers. As an alternative method, you might wipe out Committees altogether, and have the whole of your education controlled by one department in Wellington, just as you control the whole of the police courts and post-offices, and so on, from Wellington. While you have a teacher, say, in a country district with a Committee practically over him composed perhaps of men of limited attainments, and not so cultured or sensitive as the teacher, there is always a possibility of a little friction. It is the same in regard to the selection of a teacher. A Presbyterian Committee will favour a Presbyterian teacher, and a Prohibition Committee a prohibition teacher. All these phases are apt to crop up. I think it is very degrading to have teachers going around pulling the wires in order to get a selection. I have seen that sort of thing in Auckland and Gisborne, and it is not a proper thing at all. There should be some system of grading teachers by which a teacher would put in an application for a position, and under which he would get that position or lose it on his merits. I was rather prominently connected with one case in Auckland where the teacher came into conflict, first of all with the Committee, and subsequently with the Board and the Inspectors. There was a terrible row, and the whole matter finished up with a case before the teachers' Court of Appeal. The consequence of that was we had a dreadful School Committee election, with three policemen in attendance, with a final result that the teacher was reinstated and got substantial damages. At the same time, that did no good to the cause of education. It degraded the teacher in the eyes of the children, and it caused all sorts of local trouble in the district. All that would be avoided if School Committees were wiped out and teachers were put in these positions by reason of merit and long service, and kept under the absolute control of the Department. I do not think corruption and prejudice are altogether confined to School Committees. In my experience they are much more common to Boards than to School Committees. I think the whole system needs overhauling, and I have come to that conclusion after my experience both as a parent and as a member of a School Committee, and after comparing the systems with systems I have known and studied elsewhere.

3. *Mr. Wells.*] You mentioned the desks in use: is it the custom throughout your district to use these long desks?—It is a new district. They gave us dual desks in the standards, and long desks in the infants.

4. You spoke of trouble with unclean children: you know, of course, as a Committeeman, that the teacher and the Committee have full power to deal with anything of that kind?—Yes, but it is such a delicate subject to handle, and so apt to bring the teacher into conflict with the parents. If there was some system by which a nurse could go around the schools and make a thorough examination it would save all that trouble.

5. I gather from your remarks that you are not in favour of Committees having any voice in the appointment of teachers?—Provided the Boards are abolished.

6. Supposing teachers in the Board's service are graded by the Inspectors, who know them intimately and can appraise their work, and that all appointments are made from that list in order of merit, where is the objection?—In the first place, what are the qualifications of the Inspectors for grading? I have known Inspectors in Auckland who have been dry-goods clerks at one time, and not trained teachers at all. What is their grading worth? If they were competent Inspectors, I should say it would be all right.

7. Do you not think your strictures on the members of your Board are a rather severe indictment of the School Committees in regard to the choice of their men?—That is a matter we will endeavour to remedy in the near future.

8. The Boards are selected by the School Committees?—Yes. But the Committees are over such a scattered area that it is only lately they have been able to come in contact with each other.

9. As to your reference to smoky chimneys and so on, I imagine that is an isolated example of faulty building?—I do not know. That is the first school I have had anything to do with. It is a brand-new school, but it does not speak much for the Board's idea of architecture that that should happen.

10. Your evidence goes to show an entire want of consideration for local needs on the part of the Board ?—Yes.

11. You have expressed somewhat sweeping views in regard to education, and made comparison with the Old Country: do you mind telling us what your qualifications are to express these opinions ?—I had a public elementary education in the Old Country, and also a private-college boarding education, and then I went to King's College, in London. I do not think I was anything exceptional, but when I was fourteen I left the public elementary school, and before that I had taken six sciences at South Kensington. I do not know of any here who would do that. They do not start so well here, and the system is not so thorough. I think the children are more like phonographic records than educated children.

12. Mr. Milnes gave it as his opinion this morning that our primary system compared more than favourably with the Home system, and that we are also getting good value for our money ?—If Mr. Milnes said that we are getting a better system than that of the London County Council, I cannot understand it.

13. *Mr. Kirk.*] You say, in addition to the other matters referred to, that an assistant teacher was sent to you for twelve months without your Committee being consulted ?—We were not only not consulted, but our recommendation was deliberately ignored.

14. Before the appointment was made, did the Board in any way consult you ?—No. We simply wrote saying that Miss So-and-so had been granted twelve months' leave of absence, and that we recommended the next female assistant be appointed in her place, and that a supply be sent to take the place of the one who had been moved up. They replied that in the Inspector's opinion she was not suitable, and they sent a teacher who had never had an infant class in her life.

15. Was this appointment for more than three months ?—She was appointed to a position that was vacant for twelve months.

16. We may take it that your experience has been that the Boards do not exercise their functions in a sympathetic manner ?—I do not say that altogether. I say their functions are practically useless ones, which could be cut right off the education system. I think they do their best according to their lights.

17. *Mr. Poland.*] You have been a candidate for Education Boards ?—Yes, merely with the idea of stirring things up.

18. You do not approve of the election of Education Boards by School Committees ?—No. I would like to see them, if possible, elected on the same franchise as any other local body. I think that would bring them more into contact with the public.

19. Do you think if you had Boards elected in that way you could dispense with the functions of the School Committees ?—I think both could be wiped out without any loss to the system—I think that honestly and sincerely. All we want is a local manager to run round occasionally.

20. *Mr. Kirk.*] Do you know of any schools which systematically fumigate their buildings ?—Not a fumigation. We have had a dozen epidemics since we started, and there has been a fumigation after each. Our practice is to have a strong carbolic disinfectant spread over the floor overnight after the school is closed. That is swept up in the morning, and that keeps the place pretty clean.

21. You know the Kai-iti School in the Gisborne district ?—Yes.

22. You do not know of any epidemic in connection with the school ?—I have heard of none arising out of any defect in the school itself.

23. Do you know, as a matter of fact, that the School Committee has the building itself fumigated with sulphur every term while the children are away ?—I do not know that; but I think something of that sort would be necessary in some of the older schools.

24. *Mr. Davidson.*] Do you think that the teaching service is less popular than other branches of the public service ?—Naturally; it is the worst paid.

25. Is there any other reason ?—For instance, I would not be a teacher under the present system, to be pulled about by Boards, and Committees, and Inspectors at the salary they pay.

26. You think the multiplicity of masters is really largely responsible for the unpopularity of the service ?—Very often, no doubt. I have known of teachers appointed to a district practically against the public wish there. The consequence is a change of Committee makes it very interesting for that teacher.

27. Would you place the Inspectors of the Dominion under the Central Department ?—Certainly, and I would keep them wandering round the Dominion—not circulating round one small district all the time.

28. Do you know that in the Australian States that is the system adopted ?—I understand they have State Inspectors only.

29. You understand the State is divided into inspectorial districts ?—I do not know much about the districts on the other side. I will take the London County Council, for instance; they have Inspectors, but they merely go round on what are called "surprise visits," seeing that the rolls are properly kept, and that the schools are clean; but His Majesty's Inspectors are employed by the Education Department. They would not trust any Board Inspector, and they would not give any capitation on an examination by a Board Inspector. He is only the servant of the particular Council he is working for.

30. If School Committees were abolished, and their duties were performed by the head teacher, who would be allowed to spend the maintenance grant in attending to the sanitary arrangements and so on; do you think that would be better than the present School Committee system ?—If you are going to wipe out Boards and Committees and start afresh, I would say Yes.

31. Do you think that would make the teaching service more popular in New Zealand ?—It would certainly mean putting the teacher in a position of some self-respect and independence. At the present time some of the Committees seem to think they own the teacher, body and soul, in school and out of school.

ROBERT EDGAR RUDMAN examined on oath. (No. 13.)

1. *The Chairman.*] What is your position ?—I am principal of the Thames High School.

2. And your educational qualifications are ?—A1, M.A., and B.Sc.

3. Will you make any statement in regard to any point in the order of reference that you please ?—With reference to the expenditure on manual and technical instruction, so far as my secondary school is concerned—it is a mixed school—we get grants in connection with our science training and such things as needlework ; but so far as any influence on our work is concerned, I do not think these grants are necessary in regard to technical education. In the district I come from we have unique facilities for technical education, in that there is one of the finest schools of mines I suppose in Australasia. It is splendidly equipped, and has a splendid director—I think anybody who knows him knows that—and yet it is very badly attended. It would appear that the residents of the Thames do not like that sort of technical education, although I suppose a boy going through that school of mines is fitted to make a much better living after his four years there than at almost any other occupation. There is also technical training to be got quite easily at the foundries at the Thames. A boy can get a very fine foundation by being apprenticed there for technical work. On the top of that we have the Technical School, which is quite a nice building, and it seems to me that as the people who live there do not make much use of the really good technical institution there, it is almost a case of overlapping to have the Technical School at all. Of course, that Technical School is used for giving the primary-school children instruction in cookery and woodwork, I think. I think there is a plumbing class of three or four, and a few other technical classes that are not well attended. It seems to me that the day classes in a technical school, except in the big centres, lead to overlapping with the secondary schools—I mean where the day classes of the Technical Schools are being subsidized for such things as commercial English, commercial arithmetic, and commercial geography. The word "commercial" is added to them, although I do not think that the teacher has any particular qualifications. I am not speaking in any sorrow, because they do not interfere with me in any way, but they might do so. In regard to this overlapping, I would be inclined, except in the large centres, to wipe out subsidies to technical schools for primary commercial courses, because I think, with the exception of typewriting, these commercial courses can be taught in the secondary schools. I believe in the continuation night classes. I am referring only to the day classes. The point has come under my notice at the Thames, and I am afraid my Board has had a little bit of correspondence with the Department on the matter. Some eighteen miles from the Thames there is a district high school. Now, rightly or wrongly, I have regarded district high schools as a sort of stopgap until a fully endowed high school could be built, or until the circumstances warrant it being built. We have an endowed High School at the Thames with a fairly well-paid staff of four. This particular district high school is staffed with two ladies. I do not wish to draw invidious distinctions, but of course if we, as an endowed high school, are not doing much better work than they are, we should not exist. Now, the Department will not pay the railway-fares for pupils to pass this district high school to come to the Thames High School. That is in accordance with the regulations no doubt, so of course I must not blame the Department. I hold, and my Board holds I think, that the High School at the Thames should be for the whole of the district, and that if a parent wants to send his child to the High School past the district high school he should be allowed the railway fare. As it is, quite a number of parents have applied to me, and quite a number of parents in the place where this district high school is situated are sending their children to the Thames High School, and are themselves paying the fares, the Department having refused to do so. They, of course, come in as junior free pupils. I may say that the senior free pupils have their fares paid because the Department says they cannot get that particular instruction at the district high school. I merely mention this as a matter that may be worthy of attention. I think where there is a properly endowed and staffed secondary school, and where children wish to attend that school, they should not be debarred from doing so by reason of the railway fare. There is another instance of overlapping which I think perhaps most of us secondary-school teachers have come across. There are some primary-school men—I do not think I am drawing invidious distinctions between the two—who like to keep their Sixth Standard proficiency pupils on for another year. In some cases I believe it is with the idea of gaining a scholarship, in other cases they say they can do better for them. They say they are not fit to go on to the secondary school, although the Inspector has given them a proficiency certificate. I find that a pupil who is kept like this is a year behind when he comes to us, and is a year behind all the rest of his school life. I think he gets the heart taken out of him by going over the ground again. So far as the finance of High School Boards is concerned, I do not think our Board is in any particular difficulty. We have an income from endowments and we have an income from the Department for free-place pupils, and I think the Board spends it as wisely as it can. With regard to agricultural instruction or rural courses, so far as the Thames High School is concerned, as I have said, there is no demand on the part of the parents of pupils to make mining experts or engineering experts of their sons. There is a great demand to take up what I suppose one might call the grammar-school course, the old-fashioned secondary-school course, with a view to the boy entering the Civil Service—that is what they are very keen on—or to enter a profession ; or, if he fails in this, to make a schoolmaster of him. In regard to this question of Latin, you would be surprised at the number of parents who say to me—of course the Department makes Latin an alternative subject, and rightly so in my opinion—that they want their boys to take Latin or commercial work. They say, "I want my boy to go in for the Civil Service" ; and I reply, "Yes, but he will not need Latin for that." Then I am asked, "Suppose he is fairly successful, and wants to become a lawyer" ; and I reply, "He will need Latin for that" ; and then I am told to let him have Latin right away. Of course, the high schools have not a general syllabus like the primary schools, but there is no doubt

that the public examinations make a syllabus for us. There is not only the Junior Civil Service, but the Matriculation and University Scholarship Examinations. We must not depart too far from these, and we must not be accused of cramming if we follow this syllabus. We have the pupils for a certain time, and we must keep them in that narrow path which leads up to these examinations. So far as my school is concerned, in connection with agricultural instruction, it is in a non-farming district, and I would not introduce agriculture on any account whatever. Quite apart from the expense of the ground for experiments, I think you want expert agriculturists to carry out the training. It is no use an ordinary school-teacher trying to do it; and then there is the fact that perhaps only 10 per cent. of the children you are teaching agriculture to will take up agriculture. I think that is a waste of school time. I think that the physical-measurement course outlined by the Department is an excellent one, with a chemistry course to follow. It has been really the old-fashioned routine in the secondary schools, but I do not think any of the newer schemes have been an improvement on it, because you may have a boy going in for mining or agriculture, and his chemistry and physical measurements will help him in either of these things, but an agricultural training will only help, perhaps, the 10 per cent. That is my idea. In my own district I do not think agriculture is advisable at all. It might pay to have an agricultural course in a place like Palmerston North, but I do not think it would be successful in regard to small-staffed schools and town schools generally. I understand that the Director of the Lincoln Agricultural College and also a rather experienced agricultural instructor—a man from the west of Scotland—after twelve months' trial, both said they considered that an agricultural course as an adjunct to secondary-school training was impracticable. I really think, if boys are going in for agriculture, if they have two years as junior free-place pupils in a secondary school, they should then go on to some other institution of a more technical description, and there learn agriculture. It perhaps need not be such a big institution as Lincoln, but there should be special schools for agriculture. Of course the secondary schools could do a good deal by having what they call in America junior naturalist clubs and field clubs. In America the master who takes, say, a particular interest in nature-study will get ten or twelve boys together, and go out and study these things in the open, but not as a regular course of instruction. As to the ninth order of reference—"In what respects school instruction can be improved and made of more practical value in equipping pupils for their future careers"—I notice there is a new syllabus for certain subjects in the Junior Civil Service Examination, and also new regulations in regard to teachers' certificates, and also a new regulation insisting on practical-science certificates for any one who is being trained up to the New Zealand University. I think that is a splendid move. I think the Department might go a step further with regard to the teachers. The previous witness spoke about the teachers not being able to get their training. There are a number of pupils going through the secondary schools, and they have a course of chemistry, and keep note books. I think if the note-books were duly certified to, the Department might find it useful to accept these certified note-books as proof of a practical course having been carried out. If that were done, the pupils in the secondary schools would regard these note-books as very valuable things to take away from the schools. In regard to military training, I am a cadet enthusiast myself, and I have done a great deal of cadet work, but I think military training in our schools is apt to overshadow the really good physical training. It is only, I think, in the big boarding-schools of New Zealand, such as Nelson, Waitaki, or Wellington Colleges, that there is really good gymnastic and physical training being carried on. I think we want a more national system for building up the physique by means of gymnasiums and Swedish drill. It is a matter of administration, of course, but I think it might be possible to have male and female physical instructors to go about from school to school, and I think that would be more valuable than woodwork instructors.

4. Are you aware that is carried out in some districts?—I did not know that. I do not think that the ordinary teacher knows enough about physical training to train girls in deep breathing and things of that kind—it wants an expert. I also think the syllabus is overloaded. Some ten weeks ago I was speaking to the late Mr. McGowan, who used to get a grip of things pretty well. We were talking about strikes, and he said we would never stop strikes until we started teaching the pupils some elementary economics in every school in New Zealand. He said we should teach them about the value of wages, and so on. I merely repeat that opinion because Mr. McGowan was a man who was listened to with attention, and he seemed to think that an elementary knowledge of economics imparted in the schools would have some little effect in the next generation on the labour question. With regard to scholarships, I think there is no doubt that some schools, by undertaking special outside coaching for scholarships, get their candidates in ahead of more clever pupils. I know in my own case, pupils come to me with scholarships who are not always the best of their year—they are amongst the best, but some others very often beat them. Some teachers put in a great deal of extra time for coaching. I also want to refer to this matter of accrediting. The Education Department has made a start in accrediting. It may not be known to everybody that there are various ways for the junior free-place holder to become a senior free-place holder. One method is by examination, and another method is on the recommendation of the headmaster. That is, I think I am right in saying, practically the accrediting system, and that seemed very good in relieving the strain on the pupils from examination; but I find the Department generally examines our pupils after we accredit them. I may say the Department does not interfere with our classification; the Department has been very kind to us, and in my two years as head I have not had any of my pupils disqualified. I suppose the Department does this examining to satisfy itself that we are doing our work of recommending properly, but the pupil undergoes the strain of sitting for the examination which he is supposed to have escaped by reason of this system of accrediting.

5. *Mr. Wells.*] You spoke about high schools and district high schools: In the Thames district there is the High School at the Thames, and district high schools at Paeroa, Te Aroha and Waihi?—Yes.

6. Do you think that these might be centralized, and one good high school set up at a convenient centre, and the children carried by rail ?—As the trains run at present all the Paeroa children could attend the Thames High School, but of course if you want a central place for the three district high schools it would be Paeroa. I do not think the train arrangements suit Waihi or Te Aroha.

7. Still, a centralization such as that is worth thinking about ?—I think so. I know we have something like a quarter of our pupils coming to us by train—some of them coming from Karangahake.

8. It seems to stand to reason that if four high schools could be centralized you could have one really good efficient school under the control of a first-class man with a first-class staff ?—I think so. Of course, we must take this into account: that it might not be good for the health of some of the pupils, who would have to get up early and travel further. That might be an objection. I have a few pupils from farms, but when they get to me they are so sick of cows and potatoes that they never want to look them in the face again.

9. In the town schools some years ago, before manual work was started, the great object of our Standard VI boys was to get into an office ?—Yes.

10. With the introduction of manual work that ambition has almost disappeared, and speaking from my own experience, I find that there is a far greater tendency for boys to go into trades ?—Yes.

11. Do you think if boys in a school had a course in agriculture it might give them a bent towards agriculture rather than to law or Civil Service, or teaching as a last resort ?—It might, but I do not think they would go to the school. Their parents have made up their minds that they are to go to certain work.

12. *Mr. Kirk.*] You agree with the remark passed by the late Mr. McGowan, that elementary economics should be taught in the schools ?—It seems to me it might bring a right understanding in these matters, but whether you could squeeze it into your already overloaded syllabus I do not know. I mention the remark for what it might be worth.

13. You believe that a different syllabus, including the teaching of elementary economics, for instance, might perhaps promote a better outlook so far as the labour problem is concerned, and that therefore this educational enlightenment is desirable ?—I think it would. In this matter I have been struck at the ignorance there seems to be amongst full-grown men as to what the raising of wages really entails. They seem to overlook the fact that when wages are raised the cost of living is raised, and they are apt to confound the gross gain with the net gain.

14. Would it be a move in the right direction to make attendance compulsory at the continuation classes, even for those taking up manual labour ?—I do not think that after a certain age attendance at any class should be made compulsory.

15. How otherwise are you to obtain that enlightenment which is necessary ?—When I spoke of that I thought that perhaps a series of six or eight lessons, prepared by a man like Dr. Hight, of Canterbury, or Mr. C. Mann, who knew his subject, should be circulated in all the schools of New Zealand.

16. Up to what age: you surely would not circulate them in the primary or secondary schools ?—I think so. I would not make a subject of it, because there is no room.

17. Do you think the majority of the children would read it through ?—The teachers might read it to them, and say something about it, in the form of ten-minute lessons, or something of that kind.

18. In what relation to life, in your opinion, does the study of the classics stand ?—Personally, my specialty is science and mathematics, but I am very glad I learned some Latin. I find it helps me to an understanding of all literature. I often come across some abstruse scientific term, and I am able to understand it through its Latin or Greek derivation. I think if we only spent a couple of years at the classics you would get some culture from it that you would afterwards be thankful for. I do not believe in making it compulsory.

19. You do think it is desirable, where possible, that a study of the classics should be encouraged ?—Yes. I have been surprised at the number of parents in the Thames Goldfields district who come to me and say they want their boys to have Latin.

20. Is there a danger, considering the subjects being put into our syllabus, of the study of classics being removed further and further from our students ?—I do not think so. I think in all the secondary schools I have been in there was always a classical master on the staff, and as a rule the cleverest pupils are pretty well made to take classics. Those are the only pupils in my little school I bring any pressure to bear on.

21. Have you found that, notwithstanding such advice, parents will write to you and say, "I want my boy to take shorthand or typewriting instead" ?—Yes, I have found it so in many cases.

22. In your opinion, is the door too widely open at the present time for boys and girls to discriminate at an early age as to what subjects they will choose ?—I do not think the boys and girls do discriminate. I think it is principally determined by the examination they want to go in for later on.

23. Can they themselves at an early age discriminate even as to the examination which they desire to go in for ? For instance, my great ambition was to be a farmer, and I went on the land, and having spent a few weeks there I found I was not suited for it, but I had such a good grounding in what was necessary to pass the Matriculation Examination that it was not very hard for me to pass the necessary examinations, with the result that I was at twenty-two years of age in actual practice as a lawyer. That is why I am so keen to see whether the same course which I benefited from is still open to boys as it was to me. Suppose I had at that early age said I wanted to learn something to do with dairying, would I or would I not have been neglecting other things which must have been of service to me in the vocation I ultimately chose ?—I will take agriculture and Latin. I think if you neglect Latin for the three years you would probably never get through the preliminary law examination, whereas, if you neglected agriculture, you could pick that up later on by going on a farm, because you could pick up in eight months or so what you have neglected in the three or four years previously.

24. Does that not seem to bear out the contention that these vocational classes should be left until after the secondary-school period is ended ?—I think so.

25. *Mr. Poland.*] I understood you to say you believed that the teaching of elementary economics in the schools would ultimately lead to employers giving greater consideration to the claims of workers, and so on, and thus prevent strikes ?—I did not quite say that. What I thought was that possibly the general mass of the workers might have more solid ideas in regard to wages and strikes if they had had something to do with these subjects in their school days.

26. You do not think employers should have a little more knowledge of elementary economics ?—I think everybody should, because you do not know who is going to be an employer twenty years hence. You see a meeting of labourers, and the only man at it who seems to have any ideas is the strike leader, and he says "strike," and they strike. If they knew something of economics, no doubt they would argue the matter out.

27. There are three district high schools within a short radius of the Thames, and you recognize that that shows a keen desire on the part of the inhabitants of that district for the best possible education for their children ?—Yes.

28. And you also think that in order that parents should have that best possible education for their children there should be no hindrance put in the way of attending the Thames High School as is now the case, by compelling them to pay railway fares ?—That is so.

29. If a parent thinks his boy, after obtaining a proficiency certificate, is going to get a better education at the Thames High School than he will get at either of these three other places, you think he should have every facility given to the child to attend that school ?—Yes. I think the Thames High School was meant to benefit as large a district as possible.

30. *Mr. Thomson.*] Will you state what subjects could be eliminated from the primary-school syllabus, which you think is overloaded ?—It is some years since I have been in touch with a primary-school syllabus, and I would not like to express an opinion. I said, in speaking of economics, they probably could not be taught, as I understood the primary-school syllabus was already overloaded.

31. *Mr. Davidson.*] What is the average attendance at your school ?—100.

32. And you have four teachers ?—Yes.

33. You are satisfied with the financial arrangements ?—Quite satisfied.

34. You disagree with the gentleman who thought that the minimum capitation for free pupils is insufficient ?—Yes, I think we are not very strongly endowed, but we seem to pay our way very well. Whenever I ask for apparatus my Board are able to give it to me, and they give our staff rises, and that sort of thing.

35. You referred to the Technical School at the Thames, and said there was considerable overlapping between that school and yours: are there day classes at the Technical School ?—They try to have day classes. I do not say there is actual overlapping, but there might easily be overlapping if the Techincal School was supported.

36. There are no day classes ?—There are some day classes. There is a commercial course there—they take it because of the shorthand and typewriting; but of course they have to take other subjects, such as arithmetic, geography, and so on, in order to qualify for the manual and technical grant for the complete course.

37. There are really day classes in connection with the Thames Technical School ?—Yes.

38. And in these classes they teach subjects that might be taught in your school ?—Yes.

39. And eighteen miles from the Thames there is a district high school with two ladies on the staff. Can you tell me the average attendance in the high school department in that district high school ?—I cannot say, but I think fifty.

40. You remarked that in the secondary schools there is no general syllabus: would you have a general syllabus for the secondary schools of New Zealand in which certain subjects must be taken up by all pupils and certain subjects could be optional ?—No; because I think too much depends on the staffing. I think the examinations confine us to certain subjects as main lines.

41. And if you have plenty of staff to take side courses you can do so ?—In a small school like mine you cannot have too many side courses.

42. Are you aware that in the most recently drafted course of study in some American secondary schools there are three definite courses—namely, a classical or English course, a commercial course, and a vocational course—and that in each of these three courses certain subjects are common and compulsory and certain subjects are optional ? Do you think it would be a wise thing to have a general course laid down for the secondary schools of New Zealand on these lines ?—I think it would if there was plenty of elasticity in it.

43. Would you be in favour of the control of the primary, secondary, and technical education being under one body in each educational district ?—No.

44. What is your reason for objecting to that ?—I have worked under three Boards of Governors—Napier, Wellington, and Thames—and I find it is always their aim to do the best with their money. If they get a man that they consider useful in their school they help him by raising his salary, and so on; and it seems to me that each of these little institutions, self-governing and self-financing, has worked very well.

45. Do you not think they would work equally well if within the Education Boards there were special committees to control these schools ?—I am afraid that a certain amount of that red tape my predecessor spoke of might be apt to creep in. I do not think it is called for.

46. You do not think our education system should be co-ordinated ?—I think that it could be co-ordinated by a decree of the Central Department.

47. Would you have the whole system under the control of the Central Department ?—I take it the co-ordination would refer to the teaching and not to the finance. I do not believe in a Dominion scale of salaries for secondary-school teachers.

48. Why not ?—It is so difficult to judge them. I will take a big boarding-school, for instance. There may be a teacher who is a particularly good man for that school, because he is a good footballer or gymnast, and can organize the boys well. There may be another man who is particularly desirable for the sixth form because he has specialized in some subject, but possibly his discipline is not the best thing in the world. I do not, however, know how you are going to bring these different people in the high schools on to anything like a uniform scale of salaries.

49. Do not the same difficulties exist in connection with the primary schools ?—I do not think so.

50. *Mr. Hogben.*] Have you ever been in any school where there was an agricultural course ?—No.

51. You have not seen an agricultural course being taken in a school ?—No.

52. Have you ever been in America, and seen an agricultural course taken in high schools there ?—No.

53. Then, you are speaking from your general impression ?—Yes, and from reading.

54. Do you think there is any difference in scientific principle in finding the specific gravity of milk or the specific gravity of sulphuric acid ?—None whatever.

55. So that so far as finding the one in an agricultural course and the one in a physical-science course is concerned, they are in that respect equally good ?—Yes.

56. Have you looked through the agricultural-science course ?—Yes.

57. Does that not all the way keep close in touch with scientific method ?—Yes.

58. That would train in scientific method if properly taught in a practical way ?—Yes, with a big leaning to the agricultural side, whereas the physical-measurements course, which treats with the same subject is not only applied to agricultural but to other branches as well.

59. Is not the main thing to get into the best habit of mind in accordance with scientific method ?—Yes.

60. What difference does it make if the tests used are of the same kind whether they are going to influence his future life or not ?—The only difference I think that the agricultural course gives.

61. Would it not be just as good for a boy's training in scientific method if the subject is elementary agriculture as if the subject is elementary physical measurements ?—No, I look upon agriculture as more particular than elementary physical measurements.

62. *The Chairman.*] You are quite satisfied the commercial course as taught in the Technical School in the Thames could be overtaken by your school ?—Yes. When I applied to have some of my children sent along to make use of the typewriters at the Technical School they said they could not take them for typewriting alone—that they must take the full course.

63. And ostensibly that full course is used to entitle them to the grant from the Department ?—Yes.

Edmund Campbell Purdie, examined on oath. (No. 13.)

1. [*The Chairman.*] What are your educational qualifications ?—I hold a D certificate. I have been a teacher in all varieties of primary schools; I taught for five years in the secondary schools; I was an Inspector for eight years; and I was a member of the Auckland Education Board for two years. I am not occupying any scholastic position at present.

2. I understand that you wish to address us in regard to certain points; and with regard to other points, you will put them in writing on returning home, have them attested by a Justice of the Peace, and return them to the Commission ?—That is so. I wish first to speak with regard to a scheme for the improvement of the education system which I brought before the Inspectors' Conference nine years ago. I was then urged by the Inspectors present to hold the matter over for three years, in order that they might have an opportunity of discussing the matter, and I agreed to do so. Three years subsequently the Inspectors' Conference, by a very large vote, approved my scheme. I also brought the matter before a variety of education authorities—the Auckland Branch of the Educational Institute, the Whangarei Branch of the Institute, and the Assistant Masters in Auckland. Without any exception they indorsed the principle of my scheme as being thoroughly sound. All that I asked them to do was to affirm the principle. I do not suggest that every detail is correct. To me it seems a matter of very great importance. At the time I brought the matter before the Inspectors' Conference in Wellington nearly every leading newspaper in New Zealand took it up, and in no instance that I am aware of did any newspaper oppose the principle underlying the memorandum I propose to read. I may say that I submitted the memorandum to the Auckland Education Board, who referred it to the Education Department, but the Department did not, as far as I know, take any action in regard to it. The matter was brought up by Mr. Stallworthy in the House of Representatives, and the Minister of Education (the Hon. George Fowlds) said that while he was not prepared to accept the recommendation contained in my memorandum, he was to some extent favourable. I mention these matters to show that the principle received the almost universal approval of laymen, as witnessed by their newspapers, and of education authorities throughout the country. I addressed the memorandum to Mr. Petrie, who was then Chief Inspector of Schools for Auckland District, I being at the time in charge of the northern district, and Mr. Petrie forwarded it to the Board. I consider that the country which first adopts the scheme of organization such as I propose will make an immediate advance in primary education. That is why I wish to give evidence in regard to it. It seems to me that it will make for both economy and efficiency in the carrying-on of our education system. The memorandum in connection with it is as follows :—

"Auckland, 20th June, 1905.—The Chief Inspector of Schools, Auckland.—SIR,—I have the honour to request your attention to a scheme for the better organization and teaching of the pupils in Standards IV, V, and VI of the primary schools in large centres of population. The chief difficulty met with by teachers of the higher classes in large schools is not so much the largeness of their classes, as the difference in mental attainment and mental capacity of the pupils nominally in each class. Generally speaking, each large class contains at least three main subdivisions, consisting severally of the dull, the mediocre, and the bright. These children, differing widely, as I have indicated, in mental attainment and capacity, have the one objective. The curriculum of each class seems to have been based upon the absurd assumption that children are about equally equipped in mental capacity, and that they progress at about the same rate. The result is, in my opinion, that the dull are made stupid, the bright become somewhat lazy, and the mediocre are well taught. And under the system at present prevailing no blame can be attached to any one. The teachers work hard and skilfully, but the conditions under which they are working make it impossible that the best can be made of the innate faculty of every child. From a national point of view, this is lamentable. It is especially desirable that the best possible should be made of every bright child. This, under present conditions is but rarely attempted, and, indeed, cannot be done at all. I therefore advocate a change in the conditions. Omitting Devonport and Northcote Schools (because of the intervening waterway), there are at present in the city and suburban schools (according to last quarter's returns) 656 pupils, taught by nineteen teachers in nineteen schools; about 900 in S5, taught by twenty-three teachers in nineteen schools; and about 1,200 in S4, taught by twenty-four teachers in nineteen schools. There are thus in the upper standards about 2,850 pupils, taught in nineteen schools by sixty-six teachers—an average of about forty-four pupils to every teacher. The numbers actually taught by each of the various teachers ranges from fifty-five to thirty-nine in S6, from sixty-nine to thirty-two in S5, and from seventy-four to thirty-three in S4. (*Note.*—I have included in the total in every standard the pupils who are grouped in S4, S5, and S6, or in S5 and S6 for teaching purposes, but have not done so in the varying numbers taught by one teacher of grouped classes. In any such case the evil to which I am drawing attention is accentuated, not diminished, by the grouping.) Omitting for a moment the injustice to the pupils by such varying range, it would seem that some teachers are working under much more onerous conditions than others. Remuneration by no means coincides with onerousness of conditions. In 1904, for teaching sixty-five pupils in S4 one teacher received £235. In another school in the same year one assistant and pupil-teacher, for teaching ninety-four pupils, received between them £160; in the same year one teacher with vicarious assistance taught eighty-six pupils in S4 for £120. Anomalies such as these are inseparable from present conditions. At the risk of repetition, I should like to emphasize the fact that the condition that most injuriously affects teaching in our large schools is the difficulty of correctly grading the pupils. The remedy is clear: it is, however, exceedingly difficult to carry into operation. The pupils of S4, S5, and S6 are not sufficiently concentrated. Were they concentrated in, say, three centres there would be in each an average of 220 in S6, of 300 in S5, and of 400 in S4. Five teachers could then teach S6 in each school, six could teach S5, and seven could teach S4. This would result in an economy of twelve teachers. Were this done, it is manifested that the grading of pupils could be so uniform (having regard to attainments and capacity) that progress would be made much more rapid and sound than it is now. The dull boy now has a weary life. He is constantly being urged beyond his powers; he is too often the subject of 'odious' comparisons with his brighter classmates; with the result that he loses effort—he accepts his dullness, and loses confidence in himself. The bright boy, on the other hand, is unduly elated. He can overtake the work with the greatest ease. The constant iteration of the work rendered necessary by the presence of his duller classmate wearies him. He too often becomes conceited or lazy, or both. It is a fact that in the subsequent battle for life the bright boy is often worsted. Is it not worth while, at least, to consider whether his easy school career is not to some extent the cause? Place him in a class where all are bright—where all must use their best endeavour—and he will better find his level and better realize that there are in the world others besides himself with faculty for learning and for thinking. He will do much better work. It is my conviction that he could do at least twice as much as he now does. The energy thus released and, as it were, given scope might be devoted to incursions into other realms of knowledge. Again, the dull child would progress upon sounder lines. He need not be urged beyond his powers. If advisable, he need not be required to undertake the study of all the subjects specified in the syllabus. Subjects that appealed to him—woodwork, for instance—might receive greater prominence. He might thus be taught to believe in himself—a lesson more valuable than all the books can teach. He might learn, too, that ability does not lie solely in the power to assimilate the written word, but that the boy who can do things is as likely to succeed as the scholar in abstractions. And so varying through the different grades. (*b.*) The teacher's work would be much more agreeable than it is now. It may be thought that the teacher of a 'dull' class would have an unhappy existence. That is by no means the case. It is the effort to bring into one objective children of varying attainments and capacity that renders the teacher's life burdensome. If a teacher had to teach only pupils of approximately uniform attainments and capacity, no matter whether they were dull or bright, his work would be pleasant and not too onerous. (*c.*) A loss of time at present accrues from pupils attending manual-training schools. Such would not occur if the pupils were centralized as herein indicated. (*d.*) Better provision could be made for the teaching of science. The equipment of laboratories for three schools would not unduly strain the Board's finance; the equipment of nineteen would do so. Without a laboratory the teaching of science is little better than farcical. (*e.*) By the adoption of the scheme I herein suggest, a more healthy spirit of effort than now obtains would be created. No ordinary boy of eleven, for instance, would be satisfied to attend a junior school when he saw another of the same age going to a senior. (*f.*) The scheme would tend to economy. At present the actual cost of teaching

656 pupils in S6 is £3,663; of 900 pupils in S5, £3,875; of 1,200 in S4, £3,685: a total of £10,413. This does not include the proportion of the headmaster's salary as general supervisor. For such add, say, £1,500—a low estimate—and the total is £11,913. If the teachers were paid according to scale as under, there would be a saving of £2,300 per annum from which to pay the salaries of the headmasters and of the specialists required. The average salary of each teacher would thus be much higher than it is now: (*g.*) Suggested scale: S6—Three teachers at £250 each per annum, three at £225 each per annum, three at £200 each per annum, three at £175 each per annum, three at £150 each per annum: total, £3,000. S5—Three teachers at £220 each per annum, three at £200 each per annum, three at £180 each per annum, three at £160 each per annum, three at £150 each per annum, three at £140 each per annum: total, £3,150. S4—Three teachers at £210 each per annum, three at £190 each per annum, three at £170 each per annum, three at £160 each per annum, three at £150 each per annum, three at £140 each per annum, three at £130 each per annum: total, £3,450. I think no saving in money ought to be made. The gain should be expended in giving higher salaries than those suggested. (*h.*) It would be possible to place a child in each subject in the class for which he is fit. (*i.*) The sites of the three present manual schools might be adopted. (*j.*) Some of the prizes in the professions of teaching might thereby be within the grasp of our lady teachers. (*k.*) Better specialization in drawing, in science, in drill, and in technical work might be provided for. (*l.*) A great improvement in the attitude of the pupils and of the teachers—a most important matter—might be expected. (*m.*) Better provision might be made for school libraries. (*n.*) Teachers could be more easily placed in positions for which they are best suited. (*o.*) Distance is not really an objection. No child would have to travel more than about two miles (except by rail), very few more than a mile and a half, and not many more than a mile. Generally I believe that by adopting the scheme herein briefly outlined—a scheme which does not, so far as I am aware yet obtain in any country—education would gain incalculably, justice might be done to all our pupils, greater advantage might be taken of our manual-training schools, the teaching of science might be greatly improved, the spirit of healthy rivalry and of effort might be augmented, the pupils' and the teacher's life might be rendered more bright, and fruitful economy might be observed, satisfactory equipment of schools might be rendered possible. I cannot think of any objection to the scheme herein outlined that cannot be satisfactorily met. I am satisfied that the country that first applies to its schools the principles herein enunciated will rapidly take a foremost place among educated races. I am aware that to carry into operation the scheme herein outlined legislation would be necessary. The amounts quoted in section (*f*) hereof are subject to slight fluctuations, but are sufficiently constant to form the basis of an argument. Although I have, for convenience' sake, advocated three schools, I believe that two would be enough, and that by the adoption of two the principle of accurate grading could be materially improved. I hope that you will see your way clear to, at least, commend the principle underlying the scheme I have herein outlined.—I have, &c., E. C. PURDIE, Inspector of Schools."

And the following is the correspondence:—

"Education Board, Auckland, 24th July, 1905.—The Secretary, Auckland Education Board.—SIR,—I have the honour to transmit, for perusal by the Board, the accompanying letter addressed to me by Mr. Inspector Purdie. There is considerable force in much of what Mr. Purdie urges, but, with the law relating to education standing as it does, the organization he recommends is impracticable. —Yours, &c., D. PETRIE, M.L., Chief Inspector."

"Education Department, Wellington, 17th August, 1905.—The Secretary, Auckland.—Subject: Concentration of pupils in Standards IV, V, and VI.—I have to acknowledge the receipt of your letter dated the 11th August, 1905, with reference to the subject named above. The matter will receive attention.—F. K. DE CASTRO, Secretary."

"Whangarei Branch, 23rd August, 1905.—(Telegram.)—Whangarei Branch Institute approves Inspector Purdie's concentration-of-pupils scheme.—SECRETARY."

"Mary Street, Thames, 21st August, 1905.—The Secretary, Board of Education, Auckland.—DEAR SIR,—I am instructed by the Thames Branch of the Auckland District Educational Institute to thank the Board of Education for the opportunity afforded for expressing their views on Mr. Purdie's scheme for the concentration of Standards IV, V, and VI pupils. The branch, after considerable discussion unanimously agreed to the following resolutions: 'That the scheme has much to commend itself from an educational standpoint.' 'That considerable opposition may be anticipated from Committees, as representing parents, making it exceedingly unlikely that the necessary legislation will be forthcoming.' 'That, in the absence of details of proposed legislation, it is doubtful whether the scheme will not lessen the inducements to those entering the profession, and thereby act prejudicially to the best interests of education.'—I have, &c., S. H. FERGUSON, Honorary Secretary, Thames Branch."

"Education Institute, Whangarei, 22nd August, 1905.—*Re* Inspector Purdie's concentration scheme.—The Secretary, Education Board, Auckland.—SIR,—I am directed to state that Mr. Purdie's concentration-of-pupils scheme was discussed at the last meeting of the Whangarei Branch of the A.D.E.I., and that consequent upon the discussion this branch has the honour to heartily support the suggestions made by Mr. Purdie.—I have, &c., W. H. CRAWFORD, Secretary, Whangarei Branch."

"Education Department, Wellington, 26th September, 1905.—The Secretary, Education Board, Auckland.—With further reference to your memorandum of the 11th August, and to the copy of a report from Inspector Purdie regarding the concentration of pupils of Standards IV, V, and VI in city and suburban schools, I would suggest that the subject is one that Mr. Purdie might bring up at the next Conference of Inspectors. The Inspectors could afterwards advise their several Boards.—G. HOGBEN, Inspector-General of Schools."

"Parnell School, Auckland, 29th September, 1905.—SIR,—I have the honour to acknowledge the recepit of your letter of 11th August, inviting the Institute to express its opinion on Inspector

Purdie' suggestions for the concentration of pupils of Standards IV, V, and VI in city and suburban schools. The matter was discussed at the quarterly meeting to-day, when it was decided—'That the Auckland District Institute of the N.Z.E.I. approves of the principle embodied in Inspector Purdie's proposals for the grouping of Standards IV, V, and VI in separate schools, and considers that the practical value of the scheme is worthy of being tested by the Board.'—I have, &c., COLIN R. MUNRO, Secretary.—The Secretary, Education Board, Auckland."

I invited various educational bodies to express as fully and clearly as possible any objection they might have to the principle enunciated in this memorandum, and in no case was any criticism of a hostile nature offered. It was, however, pointed out that as the law stands it was impracticable to put the scheme into operation. I quite agree with that view, but I deny altogether that that is any criticism of the scheme or the principle underlying it. I take it that one of the functions of this Commission is the consideration of the schemes for improvement of education such as I have submitted, and that if this scheme commends itself to the Commission they will advise that it be embodied and translated into law. I was a school-teacher for some thirty years, and I feel very strongly that the gravest injustice is being done to-day to the bright children of the community, and also that a large number of the children who are not perhaps of the brightest are being made less bright than they initially were. As educators, I take it that we should all do our utmost to make the most of the latent intellect of the children. I think that in this country, as in all countries, one of the saddest of spectacles is the enormous waste of intellectual power which is going on, and that a scheme such as I have devised would in the large centres of population go a long way towards decreasing the waste of intellectual power. There are other matters that I would have liked to discuss, but I will reserve those for my written communication to the Commission. As I have stated, I was an Inspector of Schools for many years, and I think that the work of the Inspectors might be made more effective in some directions without any added cost to the State.

3. Will you state in what direction?—I think each Inspector should be placed in definite charge of a district. That system obtains in the Auckland District at the present time. But while he is in nominal charge of the district he is not, and I think no Inspector in New Zealand is made responsible for his district. What I mean is this: Suppose that when I was in charge of the northern district the Department had had a staff of supervisory Inspectors, men in the highest rank of profession, and those men had gone into my district and held not this, that, or the other teacher, but myself responsible for the state of the district, then, I maintain, the schools in the out-district would be more efficient than they are to-day. I merely put that forward as a tentative suggestion—that by organizing the inspectorate the responsibility for the condition of the district would be thrown upon the Inspector. His responsibility will then radiate to the teacher, and he will feel it incumbent upon him to feel that the teaching is efficient. I would like to say, and say with a very great deal of diffidence, that when I went into one particular district I found that only one large school was being efficiently conducted. Inspectors had gone through that district for twenty years, and, in my opinion, the absence of responsibility on their part had led to that condition of affairs. If necessary, I can prove that what I am stating on this point is correct. It took me five years' work in that district to dispossess five of the largest schools of the incompetent teachers they had. That state of affairs should not obtain, and, I maintain, would not obtain if definite responsibility of the district were placed upon the Inspector.

4. You say that those five teachers were, in your opinion, inefficient?—Quite so. That was indicated by the Board's action in moving them at my suggestion later on.

5. *Mr. Pirani.*] Would not your last suggestion be almost impracticable, unless the Inspector had power to remove inefficient teachers?—It would; but I would get over that difficulty. The Inspector would have his safeguard in this way: He would report definitely and distinctly to the Board. If he were in charge of the district, he would go to the inefficiently conducted school four or five times. Two visits a year are nonsensical. He would do his utmost as a human quantity to help another human quantity to make a school efficient. If he found that the teacher could not come up to the mark, he would report to the Board in definite and distinct terms. The onus would then rest upon the Board to carry out his idea as indicated in his report. If the Board did not adopt his recommendation, and one of the staff of supervising Inspectors came into the district and pronounced the school inefficient, the Inspector would simply say, "The onus is off my shoulders. I have reported to the Board in distinct terms that the school is inefficient, and the Board has done nothing."

6. Would it not be a rather heavy task for the Inspector from Wellington to judge the school by one visit?—No. I think an Inspector who knows his business can get a very fair idea of the state of a school in a very short time; and if he found it necessary to make further examination to confirm his judgment, he could stay a day or two in the district and make certain. Any competent schoolmaster will go into a school, and by forming his opinion of its tone, and seeing a little of the work, will in an hour or two get a very fair idea of the condition of the school.

7. But if it means dismissal of a teacher, would it not be necessary to have absolute proof of his inefficiency?—That is so. Well, he can get absolute proof by submitting work to the scholars. Of course, the decision would rest with the supervising Inspector, and I take it that it would very rarely happen that the subordinate Inspector would not accept the verdict of his senior.

8. But would that evidence be sufficient to satisfy a teachers' court of appeal?—If it is not, there should be remedial legislation. Personally, I think that while the teachers' court of appeal has been a valuable court both for teachers and pupils, there are many directions in which it could be modified. For instance, I think that if a teacher in a country district is absolutely a *persona non grata* it is ridiculous that simply to conserve his private rights the children of the district should suffer. The Board should have the right to transfer him under such conditions.

9. *The Chairman.*] On whose recommendation?—I think, on the Inspector's recommendation. If you had grades of Inspectors, the juniors could be employed in the remote country districts. When in the north I had charge of ninety schools, which I think was an absurdly large number. If you had junior Inspectors at £300 a year, able young men, who would take charge of a district and remain in it for a year or two, putting their best work into it and qualifying for £350 in a better district, it would be a good idea. But you want more Inspectors, and want to give them fifty schools each, not ninety.

10. *Mr. Pirani.*] Do you not think that such a scheme would involve an enormous increase in the number of Inspectors?—I think it would. But if you had the standards grouped in the way I suggest, you could place competent assistants in charge of the schools, with one head teacher in control of a group of, say, four or five schools. That head teacher would then perform practically the functions of an Inspector. The fetish of a headmaster for every school under such conditions wants to be waved away. I think we have one of the most magnificent systems of education in the world, but I do think it requires organizing from top to bottom, and wants to absolutely change its obsolete method of organization.

11. Do you think it would assist in making teachers more competent if in the remote parts of the district there were special schools—say, one- or two-teacher schools—where other teachers could be sent for a short or long time to observe the best method?—I am sure it would. The most important work done in this country is being done in the model schools connected with the training colleges. If you had what in effect would be a model school in every group of schools—if in the northern district, with a group of fifty schools, you had a model school—for the management of a sole-teacher school is really the most difficult work known to teachers—it would be a great advantage. It is all a question of method. If you had model schools of that type their management would be the main function of the Inspector in charge of the district.

12. Would it not be wise to place a good teacher in charge of such a school, giving him, say, £100 a year more than his ordinary salary would be?—Unquestionably. It would really be economy.

13. *Mr. Wells.*] Do you think it would be an advantage if the Inspectors had more freedom of action in regard to inspection and examination—that they might be allowed to exempt a school which they knew to be thoroughly efficient, in order to help the weaker school?—It might be possible under conditions such as that—that the Inspector, instead of having fifty schools, might have ninety schools. For instance, in the northern district I could have left out twenty really efficient schools that did not require me, and I am confident that I should have paid much more attention to the schools that did require me. There are any number of schools that never need to be visited by the Inspector. It would be advisable in such cases to go occasionally, if only to encourage the teachers in the good work they are doing. As I have said, there were numbers of schools in the northern district that I could have left alone, and I may add that I examined the Auckland City School with Mr. Mulgan for five years in succession, and I know that he agreed with me that we might have spent our time much better in another way.

14. What is your opinion on the question of putting the Inspectors under the Central Department?—I do not know the central Department well enough to say. I think theoretically that Inspectors should be under the central Department.

15. If that were done, do you not think that under each Board there should be a capable adviser—a sort of resident Inspector?—There would have to be an adjustment of rights as between the Department and the Board with respect to the control over Inspectors. I think it would be very desirable if each Board should have an adviser corresponding with the present Chief Inspectors.

16. With regard to the assisting of country teachers, do you think there would be any advantage in appointing an especially capable headmaster to exercise some sort of advisory control over the schools in his neighbourhood?—That would logically follow from what I have just stated. I certainly think so. If you are going to keep the schools as they are, with all the standards right through, I am not quite certain that our schools should not be much larger than they are, in order to make it possible to classify the children into three separate entities.

17. Was the scheme you read to us drawn up before freedom of classification came into operation?—No, subsequently.

18. Do you not think that the freedom of classification that now exists has done away with some of the evils you mentioned?—No. In point of fact, it was I that proposed the freedom of classification at the Inspectors' Conference. Would you specify the evil you refer to?

19. With regard to trying to push the dull pupils along faster than they are really able to go?—On the whole it has not done as much good as it ought to have done. My point is that in the larger centres the dull pupil ought not to be there. In the small country schools it does not matter, because there is no class teaching; it is individual teaching. In a big centre such as Auckland you have class teaching, and must rely upon class teaching, and the boy who must take four hours before he can understand a sum ought not to be sitting beside a boy who can understand that sum in four minutes.

20. Do you not think that if Standard IV pupils were asked to walk two miles there would be a good deal of outcry?—That is probable, but I do not think the distance would be two miles in many cases if there were three centres in Auckland. Assuming that Newmarket were one centre, the Onehunga children could come in by train, and the Remuera children would not be a very great distance away. I do not know that in a young country such as this the Government should not consider the question of subsidizing the Tramways Company to bring pupils in. It would certainly be an economy as against separate schools.

21. Have you anything to say on the question of grading?—The grading of the teachers in the Auckland Province is largely due to myself. When I was a member of the Board I brought forward

a series of resolutions, and the grading system now in vogue is in a great measure due to those resolutions. There is going to be a fairly strenuous attempt to interfere with what I consider is the Board's right to send only one name to a School Committee. In all human affairs you have to come down to trusting to one man or body of men, and I take it that it is axiomatic that a body of men to be trusted are the men who know, and they are the Inspectors. If they say that Thomas Smith is a better teacher than William Jones, it is ridiculous for a Board or Committee to say that the second should have the position and not the first. The only men who know are the Inspectors. I do think that in the Auckland Board's scheme—I am quite out of the service now, and can say this without any want of good form—far too much stress is laid, in my opinion, upon academic attainments. I quite agree that it is a very good thing to encourage academic attainments. Yet what is the measure you apply in all the affairs of life? If you want a doctor you do not inquire as to his academic attainments. What you want to know is whether he can set a limb or diagnose disease. If you want a lawyer you ask whether he can draw a deed or interpret an Act. When you come to teaching you apply a different measure—you ask what does he know. I think far too much weight is given to academic attainments.

22. *The Chairman.*] You think the efficiency of the individual should be the prime test?—I think it should be the sole test.

23. *Mr. Wells.*] If in the grading scheme 50 or 70 marks are given for efficiency, and only 7 or 8 between the highest and lowest, is that not a very moderate allowance for education?—Very moderate. But if you are to consider academic attainments and length of service, let them be extra qualifications. If you are going to allot 100 marks to a teacher *per se*, I say allot them wholly on his power to teach.

24. Not reckoning personality?—That is one of the very essentials of the power to teach.

25. *Mr. Kirk.*] At the same time, granting that you have a good man with a non-academic career as a teacher, do you not think that that good man might have been a still better man if he had had academic training?—I do. But if I had that better man I would give him a better school.

26. You do not wish us to infer that the academic teacher should be avoided?—I believe that every one of our teachers would be a much better teacher if he went through an academic course, even to getting a degree. I believe that would improve the man, but I would not measure him ultimately by whether he had or had not gone through that course. Speaking for myself, I am quite satisfied that I would be a much more capable man had I gone through the academic course than by having failed to do so.

27. You would not suggest the utilitarian idea should altogether outweigh the academic one?—No. I think what we are aiming at is increasing culture. An academic attainment is the avenue to that. I do not want to give the impression that I underrate the value of the degree. I simply say that in the measurement of the man as a teacher I should welcome every means to improve him through that source. You are placing little children in the hands of a man who has to teach them. I say that they should be placed in the hands of the man who can teach them best, quite irrespective of any attainments he may have. I would go still further, and say that I should like to see all our teachers taking the academic course, because I believe that even the man who can teach them best would be still better for it.

28. Speaking from your experience as a teacher and Inspector, can you say that the relations that exist between the Education Boards and the Inspectors are satisfactory and in the best interests of education in the district?—I can speak as an Inspector under the Auckland Education Board and also as a member of the Board over the Inspector. I think their relation has been most amicable. At the same time, I think that as a general principle the State should control the inspectorate, and direct it in the interests chiefly of uniformity. I sincerely commend the present practice of the Auckland Board in considering the Inspectors as occupying special positions, and removing them altogether from the sphere of the grading scheme. When you come to choose your high officers they cannot be subject to a grading system. A man might be an excellent teacher, but it does not follow that he would make a good Inspector.

29. Can you speak as to the relations which exist between the Inspectors and the teachers?—I can only speak with any confidence of the Auckland Province, and I should say they are absolutely of the most happy description.

30. Do you agree with the suggestion that attendance at secondary schools should be compulsory, just as attendance at the primary schools is?—I should like to answer that question tentatively. I am inclined to say Yes—that is, within a certain radius of the school. I think a great loss has been suffered in education in country schools from the abolition of what was called the Seventh Standard. The reason the children do not stay at school beyond the Sixth Standard in country districts to-day is that there is a sort of general understanding that the Board intends to employ as teachers and probationers only those who have gone through a secondary-school course.

31. Have you any knowledge of the present-day syllabus in the primary schools?—I have some knowledge of it. I was teaching until last November.

32. Will you give us your opinion of it?—Generally I should say it is a good syllabus, but at the same time I think it has too many adornments. If you ask me to specify the subjects I should cut out you put me in a difficulty. I think we should give our children very much more history than we do. We should reinstate history and make it an important matter—not necessarily for examination, because an examination in history is an examination in facts. The value to a child in the learning of history is the impression left on his mind. If I speak to a child about Pym or Hampden, and give that child an impression in favour of justice or mercy or sacrifice or any of those qualities, that impression is left on his mind for all time, and it does not seem to me to matter whether he remembers the name of Pym or Hampden. The fact knowledge of history seems to me wholly unimportant, yet

I maintain that history properly taught in our schools will do more for the upbuilding of subsequent citizens than any subject you can teach. I have also a great belief that good poetry is going to help to make good citizens, and even though the child cannot assimilate the beautiful words at the time that he is learning them, yet the knowledge remains and the process of unconscious assimilation goes on in later life, and gives him the rich possession of a good store of good thought.

33. *Mr. Poland.*] Is there any other direction besides history in which you think the syllabus might be improved ?—The English might be improved.

34. In what respect ?—I think, though I suppose it is heresy, that we should go back to certain elements of formal grammar. I think, for instance, the child might go through a course in analysis without having to define subject and predicate, and words of that description. We can hedge round the word and give them a rigmarole instead of the word itself, though I think it is better that they should have the word. I would give them the elementary rules of syntax. Many of these children come from homes where English is not known. I say that without any disrespect for the homes, too.

35. *The Chairman.*] Is it not a fact that formal grammar is becoming less and less the vogue ?—That is so.

36. *Mr. Poland.*] Is there anything further that you would alter with regard to the syllabus ?—I was surprised to hear Mr. Mahon say the other day that he found the composition of the boys who came from the primary schools lacking in simplicity. The impression I had when last I inspected the Auckland schools was, when you remembered that it was the work of children of tender years, the composition was remarkably good. I think if I had been here I would have asked him if he would not modify his opinion on account of this fact—that for every twenty children who entered the Grammar School under the old condition of affairs there are now, under the free-place system, probably two hundred, and whereas when he originally formed his judgment he had to deal with absolutely the best children of the primary schools, now he has to take a very large number of average pupils. Any average boy or girl can pass the Sixth Standard under fourteen.

37. *Mr. Davidson.*] Do you think the present division of the Dominion into education districts is satisfactory ?—I think it is distinctly unsatisfactory. When I was on the Auckland Board it had far too much to do. We did our work as well as we could, but far too perfunctorily. I occasionally thought that the Board's deliberations were every day supplying evidence of the reason for the abolition of Boards, but I am not sure that that was right. If we are to keep the Board system, I think we should have more Boards. In all State concerns where you have big interests at stake I am in favour of centralization as against the Board system. But if we are to keep the Board system we want more Boards. The Auckland District is too big and some other districts are too small.

38. If we continue the system of controlling our educational administration by means of Boards, would you place the inspectorate under the Central Department ?—I would.

39. In looking through the departmental report I find that in one district an Inspector has a salary of £500, plus £175 travelling-allowance. In another district the Secretary and Inspector receives only £325. In another district the Inspector, who is also the Director of Technical Education, receives only £380. In another district the Secretary and Inspector gets £325, plus £75. Do you consider that that is a satisfactory arrangement ?—If you put that position to any human being in New Zealand he would say that it was silly, and yet it exists. It does not want a Commission to decide that point. The mere statement is self-condemnatory.

40. But has not the mere statement been made very frequently without any practical result ?—Yes ; there are two politicians here.

41. Perhaps you admit that since Parliament has not taken action, and since the mere statement has not had its proper effect, a Commission may be necessary to bring about the result ?—If educationists would ask members of Parliament that particular question at election meetings, the thing would be solved in one session of Parliament. May I say, with regard to the inspectorate, that when you are dealing with the monetary interests of the nation, such as State fire insurance, you give the man in charge of that Department £1,200 a year ; when dealing with the head of a bank you give him £1,200 or £1,500 ; but when you come to the man who is directing the expenditure upon the course of education in this country, which is going to affect every unit and affect the nation hundreds of years hence, you give him £600 or £700. I maintain that you should have one Inspector-General at the head ; that under him should be another grade of Inspector ; and then you should come down and down until you get to the Inspectors actually in charge of small districts. You want to pay the man at the head at least as much as the Manager of the Bank of New Zealand.

42. May I understand that you strongly approve of a suggestion to place the Inspectors under the Central Department, and have for them a Dominion scale of salaries similar to that allotted to teachers ?—I do.

43. *Mr. Hogben.*] Do you think it would be necessary that each Board should have its own expert adviser ?—Yes ; working in conjunction with the departmental officers.

44. *Mr. Thomson.*] You state that the Inspectors want organizing. If there were a Council of Education, what would be your opinion ?—If you had a permanent Council of Education consisting of three men, who knew the work of teaching and knew education in its various aspects, I think that would be one of the best things that could possibly be established in the country.

45. *The Chairman.*] If it were possible to establish a Council of Education on which every branch of national education in New Zealand was properly represented, would that tend to efficiency of administration ?—I would rather see primary schools represented in one council, the secondary schools in another, and the University in another, and then a main Council—consisting of a representative of all three. I think myself that three primary-school teachers sitting in conference could take our system and reorganize it from bottom to top. I think it is an enormous waste of time that

a headmaster who is a highly paid official should be paid in respect of the infants in his school, because all that he does, as far as infants are concerned, one man could do for ten schools. There is a great deal of waste of power in that direction.

46. You favour placing Inspectors in charge of districts. Having established your Inspector in the outfield, and kept him there for two years, would you not draw him nearer to the centre ?—Two years would not be enough.

47. Then, would you gradually allow him to come nearer until he should become eligible for appointment to a suburban area, and ultimately to a metropolitan area ?—I would not suggest that the man sent to an outfield area should have had no experience in the metropolitan area. He should have a wide experience. I only indicate in the scheme the general principle upon which I would organize an inspectorate. The key-note to the question is that each Inspector should be responsible for his district, which he is not at present.

48. Do you favour grading them and gradually promoting the man from the out-district until he becomes qualified for the inspection of the metropolitan area, or even the Chief Inspectorship ?—I should not like to see the system made quite rigid, but it should be based on some such idea as that.

49. Would it not tend to make the individual the centre of educational activity in his district?—Yes. That is what I should like to see.

50. Especially if he could be relieved of the work of examining the schools that did not require it ?—Yes.

51. Would not the adoption of such a scheme add to the present cost of the inspectorate in this district ?—It would.

52. Largely ?—Not so largely as to compare with the advantages of the system. I would like to say that I feel very keen indeed on this question of the reorganizing of our schools so that the attainments and capabilities of the child shall be the determining factor as to where he is taught, and so that by aggregation within a certain area our work could be concentrated. I really believe that that would work the greatest reform in our primary system that would be possible. I hope that the Commission as it proceeds through the Dominion will elicit the opinions of experienced teachers on this point.

53. Do you consider that the system of freedom of classification has been a success ?—A great success.

54. Are you prepared, as a teacher and past Inspector, to say that teachers should be allowed to accredit a pupil forward ?—Only in certain cases. They would have to be special cases to be approved by the Inspector, and they should be rare for a beginning. On the certificate of certain of the schools in Auckland it would be absolutely unnecessary for the Inspector to accredit, because the teacher could do it as efficiently.

HERBERT GLANVILLE COUSINS examined on oath. (No. 14.)

1. *The Chairman.*] What is your position ?—I am headmaster of the Auckland Normal School, and an ex-President of the Headmasters' Association; past-President of the District Educational Institute, and contributors' representative on the Superannuation Board.

2. What are your educational qualifications ?—I am a Master of Arts of the New Zealand University, and hold an A1 certificate as teacher. At the request of the Auckland Educational Institute I come before you to make a statement on matters within your order of reference. In requesting me to do so my committee have honoured me by the assurance that in speaking quite freely from the standpoint of my own experience I shall, in a broad sense, give a true expression of their opinions. I come, then, not as a delegate but as a representative teacher voicing his personal experience and a few of the conclusions based on it. This experience dates back to 1877, when the Education Act was passed. For ten years I was a pupil of various primary schools; later, a pupil-teacher for six years. Next I had about seven years' experience in charge of country schools—half-time, sole-teacher, two-teacher, and three-teacher schools. During the past twelve years I have been in the city—half that time first assistant master at Beresford Street School, the remaining time in my present position, headmaster of the Normal School, which includes main school, high school, model school, junior model school (or lower part of a two-teacher school), and kindergarten. My work also includes services for the Training College in training the students in methods and practice of teaching. About two years ago I spent four months as Acting-Inspector of Schools, visiting about eighty schools, almost all of which were in remote parts of the district. It affords me much pleasure to be able to bear testimony to the marked progress which has taken place within my memory in education in New Zealand, particularly in our primary schools in recent years. This manifests itself—(1) In the love of school as shown by the great majority of our pupils in contrast to the marked tendency to truancy in the last generation; (2) in the improved discipline of our schools as evidenced by the marked decrease in corporal punishment; (3) in the more natural relations between pupil and teacher, which is an important factor in that most desirable product—good tone; (4) in the more all-round development of our pupils, fitting them for their future work. This improvement is due to several causes: (1.) The wonderful advance in biology, embryology, psychology, and kindred sciences has lead to an intensive study of the child and his life—his relation to the past and to the future. This has begun to reflect itself upon us in New Zealand, with the result that we have become self-critical as teachers, and are beginning to be dissatisfied with mere empiricism. (2.) The amendments made in the examination requirements for teachers' certificates in recent years have led to a rejuvenation in the profession. (3.) The improved status of teachers due to the establishment of a Court of appeal, colonial scale of salaries, and the establishment of a Superannuation Fund has added to the dignity

of the teacher's work. All these reforms have been welcomed by teachers, each as a step forward towards our goal—a noble profession evolved from a sorry trade. (4.) The introduction of a modern syllabus which brings us into close touch with the child's life and aims at making the fullest use of his environment in leading out his inborn capabilities. And, consequently, (5) the getting-away from a narrow system of training which aimed, even in elementary schools, at concentration on a few faculties at the cost of others very important. The commercial success of England left its mark on the elementary schools, and it will be long before we can free our minds from the prejudice towards a commercial bias in education. In the last century the ideal held up to boyhood was the successful merchant, who as a poor boy had gone up to London, entered a counting-house, and by ability and industry raised himself to fame. The primary education which would give the introduction to this life was in great demand. The same ideas governed our first schools in New Zealand—a land requiring a rural rather than an urban population; and to the lads who might well have gone afield the bells again rang out, "Turn again, Whittington!" Are we not realizing at last that such a bias is quite unfitted to the national schools of this pastoral and industrial country—that our education has, in too many cases, unfitted the child to follow the occupation of his father? I firmly believe that the present trend in education is wise, and is based on a fuller revelation of child-nature that has resulted from the application of scientific method in its research. Notwithstanding this opinion of a general improvement, I think that your Commission will have an excellent opportunity to suggest further improvements. It goes almost without saying that the most crying need at the present time is that of the children of our backblocks. Particularly is that the case in many parts of this province. The difficulties are—(1) The impossibility of regular attendance owing to the state of the roads; (2) the difficulty of getting efficient teachers to serve in remote parts; (3) the frequent changes in teachers in such schools due to unwillingness to serve in them long. These are very real difficulties, and it is obvious that to remove this most serious disability suffered by many country children much help must be given from outside. The most practical suggestions I can offer are, therefore—(1) To recommend the Government to improve the roads leading to these schools; (2) to pay a higher remuneration for the teachers' services in them; (3) to give extra service marks to those who loyally serve in remote schools. The question of the higher payment of these teachers raises the whole question of teachers' salaries. I wish to record my belief—(1) That the emoluments offered to teachers and Inspectors are not likely to draw into the profession the type of man most needed for it, since the prospects of reward are much more generous in other professions requiring no more ability or preparation; (2) that the present salaries earned by the majority of teachers after long service (apart from the few more fortunate ones who hold the higher positions) are insufficient to maintain them in sufficient comfort and dignity; (3) that the increase in the cost of living during recent years has pressed very severely indeed on the families of teachers with moderate salaries; (4) that the Inspectors' salaries should be governed by a Dominion scale, and should in all cases be more than those of teachers under their direction. In the case of district high schools, the comparative lowness of salary has led to an exceedingly short tenure of position on the part of these teachers. The inference is obvious. Another direction in which improvement is desirable is the removal of the disability in regard to promotion suffered by teachers in small educational districts. There are so few good positions within their own districts, and the difficulty of obtaining good appointments elsewhere is so real, that discontent is engendered, and men try to serve in larger districts. Not for the teacher alone, but for the general advancement of education in these districts, some remedy is required. For this reason teachers would like to see a rearrangement of education districts. Then grading schemes like that in force in Auckland would be practicable throughout the Dominion. As far as it goes, this scheme gives great satisfaction, and has done much to uplift the dignity of the teacher. In one way it is incomplete. In my opinion it should grade its teacher irrespective of sex for every type of position. I doubt if the Board realizes how keenly its women teachers are feeling the injustice of being debarred from fair competition. The male teachers do not fear open competition, and, I believe, would generously welcome the appointment of a woman to a high position if merit alone were its cause. As the efficiency of the service demands that the best teachers should hold the most influential positions, I consider this position impregnable. With such a scheme so amended introduced into each reconstructed district of suitable size, the button-hole system of appointment—undignified and little less than scandalous—would be wiped out. The Boards which have voluntarily renounced the patronage to which they might have clung have earned the sincere gratitude of their teachers. Another improvement which I hope to see in the not very distant future is an introduction of the kindergarten as an integral part of our State-school system. As a result of my experience with the kindergarten in my own school, I cannot speak too highly of its good work and great possibilities, and hope that the Government will aim at a gradual introduction of this most practical and beneficial system of character-building. In regard to the Training College, I wish to urge two things—(1.) The provision for such salaries to all positions in the Normal School as will entice the most efficient candidates for the positions of critic teachers to apply. The two lowest positions are those chiefly referred to, where the teachers begin at a minimum salary of £90 per annum. These teachers have responsibilities which bear heavily upon them. Not only must they act as models and critics for students, but they are constantly under inspection from visitors from other schools. Try to realize the position, and the anomaly will force itself upon you. (2.) The extension of facilities for the practical work of the students. One hundred students practising on five hundred pupils is altogether too heavy a load for a normal school. In practical work we did by far the best work when we had only half the present number of students. The burden on my teachers is very great, and there is some loss of efficiency in the training given, to say nothing of the effect upon the children. I think it would pay the State to incorporate another primary school with the college so that the training might be as practical as possible, and thoroughly

efficient. Another improvement that should be effected in our education is a drawing together of the various branches. The course in every secondary school, vocational, classical, or technical, should be based on the primary course, and great care should be taken to see that there is no loss of efficiency through contradictory methods. That this is so I will suggest to you by one illustration. Generally speaking, the handwriting in our primary schools is careful, laborious, and of good form. Judging on several years' experience of students and others who have passed through secondary schools, scribble is tolerated in them, and the result is disastrous. The primary school, in failing to develop speed and aiming too much at caligraphy, sent on to the secondary school a pupil ill-equipped to apply his writing readily to the work required. The secondary school, looking upon writing as a primary-school subject and one not counting towards scholarship results, hurried the pace unduly, and ignored the result. To my mind, this illustration is very suggestive that different objectives on the part of the two schools in other subjects also may be leading to disastrous results. If this is true, how shall we gain greater unity of effort? (1.) Bring the two grades more into touch through their Inspectors. There has been no overlapping in the inspection. Let some Inspectors be responsible for continuity of effort in certain directions throughout the school-life of the child. (2.) To make this practicable and effective, make one Board responsible for the whole course of the child's training in primary and secondary schools. I will close my remarks with a few suggestions called for by clause 9 of the order of reference—"In what respects school instruction can be improved and made of more practical value in equipping pupils for their future careers." I would suggest first that we reduce the amount of arithmetic and develop greater facility in the simple arithmetic of every-day life. In saying that, I appreciate the improvement that has been made already in the arithmetic. I think the trend is in the right direction, but I think we want to go still further. In regard to geography, I would transfer to the secondary schools most of the theory work, and, if possible, I would lay greater emphasis, even greater than the syllabus lays at present, on observation work. I think you cannot overemphasize the importance of training a child in his early years to observe. I think that is thoroughly sound, scientifically. If we introduce theory work too soon into our schools I am afraid the effect is to kill interest and to prevent the child afterwards working out reasons for himself. I would say that as soon as a child is sufficiently interested by his observation to begin questioning the teacher as to why certain things are, then has the ideal time arrived for the teacher to suggest in as simple a way as possible the lines of thought which would lead the child to the full comprehension of the subject. As to history and civics, I would force these subjects into greater prominence. I am inclined to think the best way to do that would be absolutely to set a certain number of hours in excess of the present number required, as the minimum time which should be given to the subject. I am not prepared to advocate it as an examination subject, which is another way to draw very prominent attention to it, but I think a minimum time should be fixed for this important subject. As to drawing, I would say that this must be more and more applied. I think the time is coming when we shall have to give up purely freehand drawing. We shall rely more and more on drawing from nature and memory. Drawing is the outcome of observation. The mere copying of the work of others is falling more and more into the background, I notice in my reading on education. I recognize that the syllabus is suggesting that, but I would urge it to go still further and suggest that a practical course in drawing should be outlined from the primary classes right through to the standard classes, and that this should be based entirely upon objects. As to nature-study and science, I would say that the suggestions for this work are already admirable. If these suggestions are to be carried out, the size of the classes in many schools must be reduced. That is the only way to make the course more practical. When we find, as we occasionally do, one teacher in charge of a very large class, it is pitiful to see that teacher making strenuous efforts to teach nature-study on modern lines. We find in subjects like this the very strongest argument in favour of a more reasonable staffing of schools; and when I say the staffing of schools is not anything like what it should be to make the work effective I do not ignore the great improvements in recent years, and the fact that we still stand comparatively well compared with some other parts of the world. Of course, the cost must be considered on the one side against the ultimate good to the State resulting from a more practical and thorough training of its childhood and youth on the other. As to English, I would make the course more definite, and insist on much practical work. I think English should be taught as thoroughly and practically as arithmetic, which I think stands first as the subject most effectively treated in our schools. I think the course in English has been too wide, and that a good number of our teachers have not been able to take full advantage of the opportunity open to them to draft out a thorough course and put that into execution. I think English is such an important subject that where experience has shown there has been a weakness it might be well to revert to a very definite plan of work indeed. I would insist more and more on simple written language. I would not try to get pretentious work in composition, but would try to get every child to express his thoughts in as simple language as possible. The result of my experience as an assistant teacher is quite clear. I found that the smaller the class the better the written English, because I was able to give more work and correct more work, and I found that nothing but repeated practice would knock out of the child's written language those errors which appear to us as errors of carelessness—faults which are quite natural to any one who is not writing often. We must start early with a child and try to get him day by day to express his thoughts in simple written language, just as we now get him to work in the exercises of arithmetic. I do not for a minute suggest that the oral work should be ignored. I value most highly the suggestion of the syllabus in the direction of oral composition, and I think since that syllabus came in there has been a very marked improvement in training children to express their thoughts simply. In spelling I would allow the use of the dictionary in all examinations. I would continue word-building, but largely with the idea of helping the vocabulary. I should train children in the habit of using dictionaries, and insist on that as part

of the regular work. It is no disgrace for an adult to have to look up a difficult word in the dictionary. Why should it be a disgrace to a child in Standard V or VI if he cannot spell a word that would puzzle an adult? I would lay less emphasis on spelling and more emphasis on language. For this reason I should make dictation the test of language and not a test of spelling. That is to say, I should pick for dictation passages familiar to the children, and test them by asking them to reproduce what I was reading. I find it is very hard to kill an old habit, and it is difficult indeed to get teachers to realize that when dictation shows errors in little words, that is simply due to the want of practice day by day in writing simple language. I think you will agree with me that if we cannot clear out of the written language of the Standard VI children all these little errors, then we may as well ignore some of the mistakes in spelling made in very long words. As to writing, I would institute time tests in various standards, and I would make the improvements (1) legibility and (2) facility. I think the artistic form is also very desirable and should not be discounted, but it should not take first place as it was inclined to take in the past. The development of facility without losing legibility should be the aim in our writing. On the physical side I would give more natural conditions where possible both in the schools and in the playgrounds. I would rely on play as the chief means with little children for their physical, mental, and moral development. I think the psychology of play is only being looked into now in the world. People are coming to the conclusion that it is through the natural activity of the child that you are going to train him to something better, and the scope offered in the playground is so very great that the schools of the future will have to rely very largely on this excellent opportunity of training our citizens. I would emphasize that physical education is desirable, not to develop physical results only, but to give a better mental training. I think some of the best training in moral character must be based on physical exercises. I do not wish to labour this subject, but I would be very pleased to amplify my opinions if I am asked questions. Then, on the physical side, too, I believe that the Department should issue certificates of proficiency in swimming, and I would even suggest in deportment. The carriage of children in no country, I suppose, is so good as we should like it to be. I am strongly convinced that when a boy or girl does not hold himself or herself well, something more than the body is at fault. You have to get at the mind as well as the body. Want of self-confidence very often is at the bottom of this bad deportment. I would encourage children in every way to think as often as they possibly can of the value of a good posture, especially in walking. In regard to deportment, then, I would recognize merit where I saw it, and award a certificate for this purpose. I think such advisers as Mr. Milnes recommended in the physical work might be asked to select each year those students who they thought deserved special mention in this way. At the Normal School already we issue certificates of competency and proficiency in swimming, with markedly good results. The certificates of proficiency are issued by the Chairman of the Education Board, and thereby carry a greater value. This year we have been able to issue these certificates to certain girls. In regard to the grading of schools, the ideas of the teachers will be found in the letter sent by the Headmasters' Association through the Teachers' Institute to the Education Department. These suggestions were indorsed by the Chief Inspector, which we consider gives them greater value. They will be found in Mr. McKenzie's evidence.

3. *Mr. Davidson.*] In regard to the examination and classification of teachers, when did you see the *Gazette* containing the new regulations?—It was sent to me early in February. I received a copy before the Principal of the Training College.

4. What effect do you think these new regulations will have upon the uncertificated teachers of the Dominion?—So far as the teachers are able to carry out what is required, I think they will have an admirable effect. I refer particularly to the requirements for practical work in science, but I believe that a great many of the teachers will be unable to put in that practical work, and therefore they will suffer hardship through their disability.

5. Do you think it would be wise to leave the subject of science and grant a certificate apart from that, leaving a special certificate to be obtained later on in science?—I would do anything to encourage these teachers in the backblocks to go on with their study. For that reason the best suggestion I can make is that there should be an optional course for teachers who are absolutely shut out from doing practical work in science. I would say they should be allowed to do extra work in language or history. The Inspector-General could draw up an extra course that would be one of culture. It would be an unfortunate thing to abandon science, and I think the obligation should be put on these teachers to carry out a practical course in science in a certain number of years when they come within reach of schools where instruction can be imparted.

6. That is to say, where it is impossible for teachers to attend the classes necessary to obtain practical work you would have an alternative course?—I should, but I think I would limit them by requiring science ultimately. I am thoroughly in agreement with the suggestion that science is necessary for a complete training, and that if taken at all it must be taken practically.

7. In regard to spelling and the use of the dictionary, you are aware that in some districts it is regarded as absolutely necessary that every child in the Fourth, Fifth, and Sixth Standards should have a dictionary?—Dictionaries are now supplied by the Department under the free-book regulations. It is the *use* of them that I want to emphasize. The pupils may have them and not make use of them.

8. You are not aware they have been supplied by the children themselves in certain districts and are being used?—I know here and there it is being done, but I think the practice does not obtain as generally as it should do.

9. In connection with the teaching of English, have you noticed that in the new course of study both in South Australia and Victoria special emphasis is placed on phonics or voice-production?—I did not know until I had a conversation with you a few weeks ago.

10. Would you suggest that special emphasis should be placed on the subject of phonics and voice-production in the new syllabus?—Yes; and that reminds me that in some way I have left out any

suggestion on reading. My suggestion in regard to reading is that we must try to develop the habit of reading in our schools. In the past we succeeded admirably in training children to read aloud from certain books, but the great number who went through the schools were not so imbued with love of reading that they have continued the habit after leaving school. My opinion is that if we are to develop any habit we must give more and more time to it daily, until the habit becomes confirmed; and I would like, if it were possible, for this to be done in the school. That means we must do more silent reading. Modern criticism of the old school of reading is this: that a man brought up to read aloud only gets into a very slow way of reading silently by himself, and I think evidence can be brought to prove that many people are capable of apprehending reading-matter two or three times more quickly than others. We have done nothing so far to train a child in quick, silent reading. If that is so, there must have been a great loss of time in our reading. Reading aloud affords an excellent opportunity for training in spoken language, and of course it will be kept for that purpose side by side with recitation.

11. Have you noticed impurity in the vowel sounds in many parts of New Zealand?—A member of the Commission noticed it in my school this morning, and it would have been strange if I had not noticed it before he went there.

12. Is that not the tendency throughout he Dominion?—Unfortunately I have had no experience elsewhere—I am looking forward to a trip to other countries—at present I cannot make comparisons in this way. What I have gathered in conversation with others is that we have drawn in so many children from different parts of the Empire that probably on the whole we have less faults in diction than you would find, say, in one district in England.

13. Would you approve of systematic exercises for a few minutes daily in voice-production?—Yes, if the teachers understood the principles. I think most teachers, like myself, have ruined their voices through ignorance, and that if we had had wise direction when younger we might have conserved our strength.

14. One of the witnesses referred to formal grammar: is it not within the right of any teacher now to use what is called formal grammar?—That is perfectly right.

15. If a teacher had an opportunity to draw up his own scheme of work and that scheme of work has to be approved by the Inspector, it rests largely with the Inspector whether or not formal grammar may be taught in the school?—I would make the reservation that under the present syllabus as I read it no Inspector has the right to come to my school and say, "You must teach these terms." The syllabus lays out a good course of grammar, but in practice I think all connected with education will admit that examinations set the standard rather than the syllabus. I want to make this qualification in regard to a headmaster making out the course. I do not know whether the attention of the Commission has been drawn to the fact that the population of New Zealand moves about very freely. Mr. Metge, headmaster of a school of a thousand children, told me that he admits about five hundred children in the year. That means he must lose a good many hundreds too. That is one of the greatest difficulties we have under a system which allows a teacher a very considerable latitude in framing the course of work. He may frame an ideal course, but he finds that of children coming to the Sixth Standard, perhaps 70 per cent. may have come from various schools. I think that is a point that must be kept in view in regard to syllabus work. For that reason I would like to see he English course as definite as possible, so that the really practical work is done as thoroughly as possible in all schools.

16. *Mr. Poland.*] You made some excellent suggestions in regard to improving the efficiency of teaching: have you any suggestions to make by which we can reduce the cost of education without impairing the efficiency?—I am afraid the Commission will find that nut too hard to crack. I can make one suggestion by which some economy may be brought about—namely, the centralization of schools. I think the Commission could easily get from the Department or Education Boards figures that would prove that in some districts this is easily possible.

17. You believe there are districts in New Zealand where centralization could be very advantageously followed?—That is very common talk amongst teachers. I know, personally, of one good example at Coromandel.

18. Do you know anything about the rural course suggested by the Department and advocated by the Director of Technical Instruction for district high schools?—I remember one that came out, but I did not know the Department was responsible for it. My objection to that is that it does not provide sufficiently for the general education, and that it gives too great a bias towards agriculture.

19. Do you think there are too many subjects proposed to be dealt with in that course to enable children to get a general education as well?—Yes, I think the district high school should give as nearly as possible a broad general education. I quite approve of a bias towards rural life, as you will understand from my opening remarks. I think even in the towns there will not be much harm done by giving the children a bias towards open-air life, but I do not believe in early specialization.

20. Do you think that six hours per week to agriculture and one day per fortnight as a manual-training school would be sufficient for these two subjects in a district high school?—I think it is quite as much time as you can afford to give. However, in considering the times allotted you must also consider the amount of correlation. The modern idea is that all these subjects merge into and are correlated to the other—that you teach arithmetic through agriculture, and so on.

21. *Mr. Thomson.*] As a teacher, do you think more value should attach to the power to teach than to the literary qualifications?—I think one is contained in the other. I do not see how you can make a comparison between them.

22. Do you think there should be a vocational course in every secondary school?—Not in every secondary school. I think that a certain percentage of pupils who are going to fill the highest positions in life should have simply a broad secondary education, and should leave out vocational work until after that, but the great majority of our pupils who are not going to the highest positions in life must begin to take vocational work in the secondary course, I think.

23. Do you believe in teaching history and civics ?—Certainly, but I would teach them on a very different plan to the old plan. I value very little the ordinary text-books in history, because I think they emphasize the battle side and ignore the life of the people. I would like to see the Department obtain the best historical pictures that are obtainable, and provide lantern-slides of these for use in the schools. The Department could do that more economically than it is now being done by teachers themselves, myself included, and if these pictures were sent to the backblocks and country schools it would give the children in these places an opportunity of learning something of the broader world than that in which they live.

24. Would you have these subjects made compulsory ?—Certainly. In my own school I do more than is required by the regulations. To understand history the imagination must be developed, and modern authorities, I think, agree that to develop this imagination a good deal of work is necessary in the way of story-telling, so that a child, particularly one brought up in narrow surroundings, may have a chance of realizing conditions very different from his own. Unless they do that they cannot apprehend the teaching of history, and you must use pictures to make this real to them. I hope the Department will carry out this idea of importing and using lantern-slides extensively.

25. We have heard the opinion expressed that teaching by pictures is not of much use: will you state exactly what is your opinion in reference to the use of lantern-slides in the Normal College ?—I have had many years' experience privately apart from the school as well as in the school, and I think there is no handier way of teaching a class of children than with a lantern-slide. When I throw a picture on the screen all the children can look at it at once, and one child in discussing the picture can lead the thought of the others. When you have children grouped together you want to keep them all thinking along the same lines as nearly as possible, and the lantern-slide is an admirable way of directing the observation. So far I have not had the collection of pictures for history such as I would like. I find the lantern-slide very valuable, too, in connection with nature-study.

26. Would you recommend the general adoption of the lantern ?—Most certainly; and I hope that in all new schools there will be one room at least that can be readily darkened.

27. Do you think the D examination should be broken into sections ?—We do it now to keep the teachers studying, and I think that tends to help to send the backblock teachers further on with their work. For that reason I would favour the suggestion of extending the principle.

28. Generally speaking, do you think the people are getting value for their money ?—I concur in the opinion Mr. Milnes expressed yesterday morning. He gave that opinion as one coming from another country. Looking at it internally, as he looks at it externally, I am convinced that in the primary-school system the State is getting a very valuable return for its money, and I am glad to have the opportunity to bear testimony to the very useful work that is being done by many of the teachers in the service.

29. No country in the world endeavours to carry on its education in such remote parts as New Zealand does ?—There are not many countries to be compared with New Zealand in this way, and I cannot make a comparison. I think New Zealand has done very well considering the very great difficulties we have in these backblock settlements, but I think the State ought to sacrifice a great deal more to help the children of the pioneers in these parts.

30. *Mr. Kirk.*] You spoke of the detriment to education in the backblocks by reason of the frequent changes that take place in the teachers. Would that be lessened or overcome by fixing a minimum term of appointment ?—I think the effect of that would be to make it still more difficult to get any one to take up an appointment.

31. So you would not recommend it ?—I would rather induce a teacher to go by offering some reward than force him to go unwillingly. I would make this a very honourable service, and reward it as much as possible. I had experience of this myself. I went back to two half-time schools. I was ten miles from the post-office. I lived with a gum-digger and had no one to converse with all through the winter except the gum-digger. I really pitied the condition of these children, but if I was going back I would like to take lantern-slides for their benefit. I dare say there are a few places still like that.

32. Then, assuming the conditions were made sufficiently attractive in the way of remuneration, do you think it would be a wise thing to assume that the teacher appointed would stay the minimum time ?—I certainly think so. I think if you could afford to say to a teacher, "You will stay here three years, and at the end of that time, your work being satisfactory, you will get a comparatively good appointment," we should be helping these backblock schools very considerably.

33. You do not believe in early specialization ?—I do not. I would hold it off as late as possible.

34. What teaching should precede the selection of any vocational course ?—I should say a complete primary course before any vocational work at all.

35. What do you mean by that ?—I should not consider that a bias towards the rural life or towards a commercial life was a vocational course. I would be willing to see this bias towards country life in our primary schools. I would have gardens in every city school.

36. We have heard a good deal about this, and allowing for the good effect that gardens have upon human nature, what other teaching would you give as the bias before the vocational course is taken for every child, and up to what age ?—I would give each as much hand-work as possible in the primary school. I would make the course as broad as possible to develop the mind as much as the body. I think we are in the right direction now in introducing into our schools woodwork—not as a technical subject, but as a subject having an effect on the mind. I believe a boy who is trained to make a joint perfectly is going to be a more useful citizen then the boy who has never used a tool.

37. *The Chairman.*] Has that training given these boys a bent towards trades ?—I think it has. I think it is doing something to break down what I regard as the old influence of commercial life.

38. *Mr. Kirk.*] You spoke about the influence of reading: what, in your opinion, should be the purpose in view in selecting books for reading in school?—The first thing should be to develop interest in literature. I should say that if at the end of the school course a boy had not a love of reading, that the main object had failed, even though he could read aloud with fair intelligence.

39. What books would you recommend?—I should take the Teachers' Encyclopedia, which has a list of books which I think is a very good list, and I would map out a course of continuous reading, and I think I would have all the children do a very definite amount of this reading silently, and I would have discussion lessons on the matter of it afterwards. With silent reading there must be a test to see that there is comprehension of what is read.

40. Would you let them develop a taste for the lighter literature?—I should be very cautious about that. I do not say that every tendency a child has should be developed. I think there should be some restraint; but I should say that every legitimate taste the child has in his life should find expression in the school. Unless the school comes into touch with it and develops it then we lose efficiency in the school. If a boy is interested in making boats, why not let him read at school a book dealing with boats, and so on.

41. Would you eliminate such books as Henty's and Ballantyne's?—Not fully, but I would not give them the very prominent place they hold now. In this connection I think the kinematograph-film is doing much harm to our children. I would not suggest that children should not be allowed to go to picture theatres, but I think a certain theatre should be set apart to show certain work in connection with children, and I would suggest that the films at this theatre should be under censorship. I think it is very desirable for the good of the children of the State that the school influence should permeate beyond the immediate precincts of the school, and should get to the home life of the child.

42. *Mr. Wells.*] You spoke of encouraging backblock teachers by giving them, say, higher marks for service: have you thought at all of the proportion you would give?—No. If I did not give them marks I would give them a definite promise of a definite appointment afterwards. It struck me one effective way would be to double the service marks. If a teacher served three years in a really remote part I would make that equivalent to six years in the city.

43. Has it been discussed by the Institute?—No; I am not in any way expressing the detailed opinions of the Institute.

44. Do you think the tendency of these revised regulations would be to make backblock schools more unpopular?—Unless they are amended as I hope they will be.

45. I mean as they stand?—I do not think the backblock teachers are being sufficiently considered.

46. It will make it exceedingly difficult to fill backblock schools?—Yes, I am convinced of that. When I went round as an Inspector I was utterly surprised to find how many uncertificated teachers there are in these schools.

47. You spoke of the education districts: have you any suggestion to offer as to the size?—I would like to see four. The system in Auckland of grading is working admirably. The teachers here would feel very much grieved if their district is to be reduced. The broader the scope of promotion the greater will be the hope of the teacher.

48. You think you can say, as an Auckland teacher, there is no feeling that the Auckland District is too large?—It is the other way round. More than that I can say. After attending about eleven annual meetings of the New Zealand Educational Institute, I say that the feeling is most pronounced against these small districts. There are so few schools of any large size in them that good teachers want to get out of these small districts as soon as they can. I have not professionally examined in all of these districts, but I would not mind staking my reputation that the efficiency in them cannot be so great as the efficiency of the country schools of the larger districts.

49. You think that the want of hope will have a deadening effect?—A wonderful effect. I think the greatest qualification of a teacher—and I came to the conviction after four months' work as an Inspector—is enthusiasm, and anything this Commission can do to develop that will be grand work.

50. You made mention of the Normal School giving teaching practice to all the students in the classes there: are you of opinion that the effect on the children has been bad?—I would not say it has been bad. I think the children gain wonderfully from many points of view, but perhaps when it comes to getting a definite standard of work, then the burden is a little felt. One of the Inspectors told me my infant department was 50 per cent. lower in efficiency than another infant department. He based that estimate on certain practical tests he had given which did not turn out very well, and I attribute that entirely to their work being cut up so much by the training students; but on the whole I am quite satisfied there is a counterbalancing effect in giving the children breadth of training. I am convinced that if I had fifty students to train instead of one hundred, the efficiency would be much more effective—I know that from experience.

51. You spoke of making arithmetic more practical: would you go so far as they go in the Horace Mann School, where they rule out at once any sum that is not applicable to daily life?—I think that is the aim, and I would subscribe to that in a general way; but, of course, all these reforms must be made gradually.

52. You think that is the goal to be reached?—Yes.

53. In geography you would strike out much of the present mathematical geography?—Where I was sure that the children were going on to secondary work I would put all except observation-work into the secondary school. I find children do it much more readily in the District High School. I am sorry to say that the examination again governs the position here.

54. I suppose you mean organized play when speaking of play?—If you mean organized play in the broad sense, such as training one child to protect a weaker one, and training the eye and hand in handball and organization in football, certainly.

55. *Mr. Pirani.*] In regard to the grading of teachers, do you think it would be a fair thing in the grading-list, say from and inclusive of the second assistant downwards, that the men and women should

be put on the same footing ?—I said before that I would take every type of position and grade the applicants for these positions irrespective of sex, and then I would appoint the topmost. I believe the great majority of women are claiming for open competition, and the men are not afraid of open competition. The door has been closed, and the effect is that the more competent women in the profession who have a right to expect something higher have no hope of promotion.

56. Do you think it is possible with the present staff we have to have that grading brought up to date on the principle you say ?—I think so.

57. Do you not know that some teachers are only seen by one Inspector probably in five years ?—I never heard of that; I do not think it is so in our province.

58. Under a proper grading system more han one Inspector would surely have to see a teacher ?—It would be desirable, but not essential.

59. Then, do you think you would approve of the grading of teachers by any single Inspector ?—Where more could not possibly see a teacher I should take the opinion of an Inspector as better than nobody's.

60. Then you think that the promotion of a teacher should properly rest in the hands of somebody who is better than nobody ?—That is so. I think it should rest on expert opinion, and that the more experts you can have to confirm that opinion the better; but that where it is not practicable to have many experts to see the teacher I think you can safely rely on the grading of that teacher on the opinion of one Inspector.

61. In many parts of this district only one Inspector would see a teacher ?—Only in the case of young teachers. No one can work very high in the profession without knowing a number of Inspectors.

62. But is it not the people in the lower positions who want safeguarding, and not the ones in the higher positions ?—They all want safeguarding.

63. You believe in cutting up the graded list into section ?—Certainly.

64. What about the suggestion I made to supplement the training college by having certain small schools in different parts of the district conducted by special teachers, to which schools inexperienced teachers could have been brought for instruction ?—I think it is admirable, provided you make these an essential part of the training college so that the methods will be in keeping with proper principles.

65. And specially level up the salaries of the head teachers who had charge of these schools ?—Necessarily so.

66. Have you had any experience in the use of single desks in school ?—My Standard I has been using single desks for four years. I think they are very fine indeed. I recognize the difficulty that more floor-space is required, and that they are expensive too, but I think the single desk is desirable, especially as the children get bigger.

67. *Mr. Hogben.*] In regard to the science for the D Examination: under the revised regulations, would you give the fall D certificate in any case without knowledge of scientific method ?—I think I would even dare to do that, provided I gave a handicap to make up for it, on the principle of the University in regard to Latin.

68. You really think you could give a full certificate to a teacher with no knowledge of scientific method ?—I admit it would be a very great pity to have to do so, but I would rather do that than debar the teacher from getting on.

69. But would it debar the teacher from getting on if we gave him a license ?—If 5 per cent. is taken off his salary I think that is wrong.

70. If the 5-per-cent. disability is taken away, you believe a license would meet the case ?—Unless the license prejudices him in the eyes of the Board. If the Board gave a preference to teachers with a certificate, then I think it would not be satisfactory.

71. Supposing you gave a full certificate wi hout science, and left science to be indorsed, do you think that most of the teachers would ever take science at all ?—I would make it compulsory unless the conditions were such that they could not take it.

72. Do you not think the proper course would be, even if it did cost a considerable sum of money, to give them the opportunity to go through the science course ?—That is the better course, I admit. If you close the schools and give them a practical course, I am with you.

73. Could they not do it in the Christmas holidays ?—I do not agree with that.

74. Are you aware it is done in America ?—I know a good deal of continuation work is done in America.

75. Do you think it is too much to ask a teacher once in his life to make that sacrifice ?—I think it is too big a thing you ask, and I do not think it will add to the inducements to go to the backblocks.

76. You think it might be overcome if we were to bring them within reach of the science teaching ?—I think that is the best solution.

77. Do you mean by a "vocational course" a technical course ?—Not a full technical course, but such a course as would lead towards the vocation, while giving a fairly good general education.

78. *The Chairman.*] You are a firm believer in the value of kindergarten training ?—Yes.

79. Do you see any objection to grafting kindergarten education on to the public-school course in the large centres ?—None at all, except that of expense.

80. Apart from the question of expense, is it not recognized elsewhere that the children proceeding from the kindergarten to the primary school have an advantage over the ordinary pupil ?—I think so; that is my experience.

81. *Mr. Pirani.*] You said that some Inspector found fault with the infants' work in your school: was that Inspector a departmental or Board Inspector ?—The local Inspector; the departmental Inspector called the work good.

82. Then, if that Inspector was the sole judge of the efficiency of the infant teacher, according to your idea that Inspector would not be able to judge ?—I would not agree with his judgment.

83. And so he might make a mistake in the classification ?—Certainly. We are all liable to make mistakes. I do not say the present system is ideal, but it is far ahead of anything we have had.

SARAH ANN MOORE-JONES examined on oath. (No. 15.)

1. *The Chairman.*] What is your position ?—I am Principal of the Ladies' College at Remuera—a private school.

2. Have you been a school-teacher ?—Yes. I had a D certificate under the old regulations. When I taught in England I had a first-class certificate. I was Mistress of Method at Cheltenham College, and Headmistress of the Model School at the same place.

3. What is the subject you wish to bring before the Commission ?—I cannot represent all the private schools, because I have not consulted with them. This is what I wish to bring before the Commission: By the Education Act of 1908, paragraph 170, it is enacted that where teachers or managers of private schools desire to have such schools inspected by an Inspector, &c., "the local Board of Education shall therefore arrange for the inspection . . . such inspection to be conducted in like manner as the inspection of public schools." The Government inspection of private schools every sincere educationist must indorse as necessary, good, and just; but I would respectfully draw the attention of the Commission to the fact that inspection in its literal sense, unaccompanied by individual examination, as now interpreted by the Board of Education, should be amply sufficient to satisfy any Inspector that "regular and efficient instruction" is given in any school under inspection. Having had long experience in public and private schools, I venture to submit that, now examinations are in disfavour, such inspections accompanied with *individual examination* are prejudicial to the welfare of private schools, since many parents send their children to them principally to avoid the Board's examinations, the strain and excitement of which they desire to protect their children from. I ask the Commission in its work of reform to eliminate from the Act of 1908, paragraph 170, the words "such inspection (of private schools) to be conducted in like manner as the inspection of public schools," and to make it plain that such inspection of private schools be confined to the literal meaning of "inspection," and not to include examination of pupils unless specially asked for by the managers or principals of such private schools. In making this request I would show that such examinations of pupils of private schools by the local Board of Education accompanying its inspection are unnecessary, impolitic, fettering, narrowing, an infringement of the liberty of the subject, curtailing private enterprise, calculated to stereotype the individual, to kill orginality, and giving the local Board of Education (not composed of educationists) undue local power, while subjecting the pupils of such schools to ordeals in examinations by strangers which their parents, for physical reasons, wish to spare them. The inspection of all private and secondary schools is beyond criticism. I find "secondary" schools mean only those receiving Government grants, therefore this plea is not for them. I venture to assert that any trained Inspector of Schools can thoroughly inspect a private school by examination of the rolls, the time-tables, the syllabus, by hearing the ordinary lessons, and by noticing the general application of the pupils, the discipline maintained, and by ascertaining the status of the teachers; and from these data he should be empowered by the Act to certify if the instruction given in such private school "be efficient and regular" or not. Such inspectorial visits would be welcomed by every private school worthy of its existence, and without notice at any time, thus effecting a saving of Inspector's and clerk's and secretary's time, and a saving of printing and issue. The servants of the local Boards of Education must submit to all its by-laws and regulations, seeing they are supported by hat Board; but the principal of a private school finds his independence intruded upon, his privacy invaded, his responsibility increased thereby, seeing he must satisfy the local Board's Inspector as well as himself and the parents of his pupils. Moreover, his time is greatly occupied in studying and replying to the ever-increasing demands of printed matter arriving by post from the local Board of Education. The Inspector from the local Board, too, may be a neighbour, and the day before he visits the private school may have inspected and examined the neighbouring Board school, affording opportunity of invidious remarks from the "man in the street." The office must be as obnoxious to a refined, cultured Inspector as to the principal of an independent private school. It is self-evident that principals of private schools will employ such teachers and teach such subjects as will command the confidence of their patrons—the public; but if the local Board of Education is ever allowed to dictate what is to be taught and what not taught in private schools, we shall be educating the pupils according to the caprice of an ever-changing Board, and, judging by late years of experimental education, shall sometimes teach no history, sometimes no geography, sometimes only physical and mathematical geography, and always, I fear, without any study of the Bible. Not only will subjects be curtailed by a local Board of Education when it acquires the power, but even the very reading and books of study will be prescribed, and consequently the young people of New Zealand will be in danger of being educated narrowly and illiberally, tending to isolated insularism. Parents and teachers will find their freedom of action limited, the former in the protection of their children from fret and fume of examinations, and the teacher would necessarily find himself limiting his actions to what will please the local Board of Education's Inspector. Under such conditions of servitude to a local Education Board, no inducements will offer to private professors and qualified certified teachers to adopt the profession and responsibility of private schools, which are a distinct gain, and no charge on the Government of the country, seeing it is reckoned £60 per annum is saved the State on every pupil educated at such private schools. It is clear that if all the children of the colony are thus to be educated, all individuality will be erased, and the pupils will be stamped out like pins in a row or buttons on a card. Alas! there are worse dangers ahead. What is to protect our children from the regulations of a local Education Board, whose personalia, however good, is ever in transition? And who can tell what heresies of thought in sociology even may yet appear in its prescribed syllabus, or be infused in the literature it may recommend? All thinkers and educationists agree that originality in the successful teacher is priceless and unpurchasable; yet it will be perfectly impossible to keep it if the local Boards of Education are to have power to examine pupils of private schools.

Teachers will aim to please the Inspector—their own impulses retire to the background—matter and methods must be adopted to gain the Inspector's approval. After his visit they feel their wings cut, their self-respect has received a shock, the joy of their work has gone for a long time. Books they are using, though used by the first authorities, must be replaced; such-and-such subjects must receive unnecessary attention, because it is the pet subject of the Inspector then representing the local Education Board. Failure to do this would bring down adverse criticism; thus originality is crushed, and the moulding to one pattern begins of teacher and taught. As an illustration, take a very successful humorous-minded teacher at home with his pupils, who enjoy all their lessons to the full, and learn like racehorses because of the pleasantries with which their lessons are imparted. Could such a teacher be natural before an Inspector? Would he not in curtailing his humour be shorn of his originality, and be rendered awkward, as a workman with untried tools? Such power would be conferred by these examinations on local Boards that private schools of even long and tried experience may be easily ruined by them, by withholding from its pupils certificates of exemption at its sweet will. The hyper-value of examinations is, we know, now much questioned by educationists, physicians, metaphysicians, who know their evils, and the literary and business world have proved their inefficiency, so it seems now out of date to inaugurate a system which shall double the examinations of private schools. For every first-class private school pledges itself to the parents of its pupils to test the success of its work by termly examinations, the results of which—and in some cases the actual papers, the unaided work of the pupil—are submitted to the parents for their investigation. These examinations are necessary to the principal and teacher to enable them to ascertain the success of their work. Then, further examinations by the local Board of Education must prove an overlapping redundancy of examinations, and involve waste of time in several places, and a waste of nerve-strain on the part of teachers and pupils. Will not the Commission of 1912 initiate a better course than this harassing, obnoxious, fettering, stultifying, stereotyping, redundant, and tyrannical scheme of examinations of certified private schools by local Boards of Education? Thus will they ensure to the Government the pecuniary saving accomplished by private enterprise—viz., £60 per annum for each pupil of private schools—and to the certified principals and pupils of such schools the consideration and liberty they ask by removing from the Act the clause which gives local Education Boards undue power over private schools.

AUCKLAND, SATURDAY, 8TH JUNE, 1912.

BLANCHE BUTLER examined on oath. (No. 16.)

1. *The Chairman.*] What are your educational qualifications?—I am a Bachelor of Science of the University of London. I have had five years' teaching experience in England. I was Science Mistress at the Burton-on-Trent School and at the Brighton and Hove High School for Girls. I have been Vice-Principal of the Liverpool College for Girls, Grove Street, Liverpool, and I am at present Principal of the Auckland Girls' Grammar School.

2. Will you kindly state the points that you wish to bring before the Commission?—In considering the question of primary and secondary education, I would draw your attention to the urgent need for correlation between the primary and secondary systems. Much time is spent in secondary schools in going over the ground covered in the primary schools, in order to teach the children uniformity of method and style. This want of correlation is particularly felt in the teaching of arithmetic and English. In the latter subject I feel that there is a strange lack of development in the originality of the child. Girls with good memories can reproduce highflown and, for them, unnatural phraseology; but neither they nor their more forgetful sisters have any command of their own language, or any idea of arranging and expressing their thoughts. I would also urge a wider field of knowledge in English, history, and geography. There are many delightful books written nowadays which present history in an interesting and fascinating aspect to children, and much can be done by the teacher who can tell a story well and graphically, aided by maps, pictures, and other illustrations. I would urge that primary and secondary teachers should meet annually to discuss methods and text-books, so that no time is wasted in the child's school-life, and so that there should be no undoing, or going over the same ground twice. In the teaching of English it seems to me that reading and voice-production must play an important part at first. It is a great gift to be able to hear oneself, and it seems to me that silent reading can only be cultivated by much reading aloud at first. Rapid silent reading is an easily acquired art, when one has trained the mind not only to absorb by vision, but to impress and vitalize the words by attaching to them sounds. My own experience with even advanced girls (ages sixteen to nineteen) has been that where the subject-matter is dry and difficult the beauty of the language has been useless, owing to the lack of power on the part of the reader to hear and appreciate this beauty as she reads to herself. If the same passage be read aloud to her by a good reader her interest is keen, and her grasp of the subject-matter good; but she is incapable of attacking such reading-matter keenly and interestedly alone, owing, in my opinion, to her lack of the above faculty. This is especially the case with the heavier prose works and poetry. I would suggest also that much may be done to encourage reading by introducing extracts from well-known authors to supply local colour in all subjects, and by selecting markedly rhythmical and musical prose or poetry for reading aloud. Composition is weak in nearly all cases, and I feel sure that wide reading alone can remedy the weak diction and lack of originality. The teaching of English grammar is a difficult subject, and I often think that if we aimed at teaching children very little

actual grammar and much correct speaking and writing during their early years, grammar as grammar could be left out entirely. If it enters into the primary-school curriculum I would have it to be of th emost elementary character—viz., parts of speech, their functions, and the analysis of a simple sentence. If children write well and express themselves well, and are familiar with many of the well-known standard works (suited to their understanding) the extra time (if any) which would be required to make up for this lack of grammar will readily be found, as the pupil will have done a good deal of reading for her age, and will do still more by herself, and so time can be saved in that direction. In the teaching of arithmetic the great difficulty which has to be overcome is variety of method. Also, I think that the syllabus is too wide for the pupil to obtain a thorough grasp of every part of it. In geography I think that we ought to use pictures far more than we do. We should make the peoples of the various parts of the world live before the eyes of the children. Tales of travel and characteristic incidents in the lives of great travellers should be told to the children to awaken their interest and curiosity. As they advance further and reach the secondary schools I am greatly in favour of making it a real field of inquiry, so that the child considers cause and effect, always hunting for the cause when she meets the effect, or, unaware of results, by arraying before her mental vision such facts as she may know, draw possible and probable conclusions; then modifying causes alone need be taught by the teacher. For myself, I feel that we do not develop the individuality of the girl sufficiently. I am pleading now for the education of girls, for I have no experience and no knowledge of the requirements of the modern boy, although, judging from a general standpoint, many things which apply to his sister apply equally well to the boy. To return to the girl, her time in school is piteously short compared with the amount of ground which she must cover. In the race for examination certificates one is bound to cater for the requirements of the examination, and when a great deal of ground has to be covered in several subjects, it means that a more or less condensed extract of the knowledge required must be prepared by the teacher and presented to the pupil. Personally, I feel that we ought to travel the path of knowledge much more slowly in the first years of a girl's school life (up to the age of sixteen years, say), and develop in her the powers of logical reasoning, ingenuity, observation, and intelligent methods of working. Knowledge, it would seem, should come much more readily, and be of a much more valuable character, when obtained in this way; and once her powers are developed you have a self-reliant, intelligent, human being capable of working, alone or under supervision; and, since she knows how to work, her progress in education will be ten times more rapid than it would otherwise have been, and hence any delay occasioned by slow progress at first will be more than compensated. But this method of progress requires that she should be in sympathetic hands during this period of evolution. Only those who possess sympathetic understanding of the girl mentally, morally, and physically can bring her to her full perfection. This is true in any system of education—the sympathetic teacher is generally the successful teacher. This brings me to another handicap in the education of the girls. It is customary, I believe, for girls as they get into the upper standards in primary schools to leave their mistresses and to come under the jurisdiction of masters. And this, I think, is not the best thing for the girl. A woman understands women and girls far better than a man does. The man may be a teacher of exceptional ability and a disciplinarian of the first order, but he is always at a disadvantage in dealing with the girl—because, in the first case, he lacks the complete understanding of the woman, and, in the second case, chivalry gives the girl an advantage-ground of which she is not slow to avail herself. For her moral atmosphere, too, it is wiser that she be placed in the hands of women, and trained to be in the highest sense a womanly woman. Everyday experience teaches one that the grounds on which one appeals to a girl are very different from those on which one would appeal to a boy. Therefore I would strongly urge that women, and women alone, be intrusted with the school education of a girl. A man is the only teacher capable of fully dealing with a boy after infancy; and in the same way a woman, and a woman alone, can educate a girl in every sense during the years of her school-life. I distinctly approve of men specialists for certain subjects, if they are the best teachers to be obtained, but I think that the dominant influence must be woman's. When a girl's ideals are formed, her moral self developed, and her manners a part of herself, then it is immaterial what the teacher is—man or woman—provided that he or she be a good teacher. The girl is then able to discriminate, and to pick out the good, leaving the indifferent or bad alone. I think, therefore, that it would be a very great advantage if in the primary schools girls and boys could be separated, as they are in secondary schools, and the administration of the girls' schools be placed in the hands of capable women. I touched a little earlier in my paper on the over-burdened child from an examination point of view. I am in favour of public examinations being abandoned as part of the girl's school life until she is past the age of sixteen. The internal school examinations should be sufficient to maintain the standard of the work, and if public examinations, such as Matriculation and Junior University Scholarship, are set as standards in the upper part of the school (and even there they should be optional), the work of the school must be progressive, and hence we should not fall in standard. I have placed the age-limit for freedom from examinations at sixteen, because I think that the years from twelve to sixteen are the years of heaviest physical strain. Hence mental development, if forced at this period, will levy a much heavier tax on the girl then than it would do either at an earlier or later period. I deplore very much the necessity of keeping a growing girl in school, hard at work for five hours of the day, and then sending her home to further study varying from one hour and a quarter to two hours and a half at night. Preparation is essential under the present system, and girls stand on exactly the same footing as boys, without being quite so well catered for it in respect of physical exercise. I feel that some very great differentiation ought to be made between the boy and the girl at these ages. The girl must learn, and later she must take her stand shoulder to shoulder with her brothers in the arena of the world's work, and it behoves us to see that her physical strength is husbanded and not overtaxed. Hence I would ask,

on behalf of the girl, for shorter hours in the lower and middle school, and more physical exercise, and an easier syllabus. In connection with shorter hours, I should like to mention a scheme which has been in use for many years in the Girls' Public Day School Trust's schools in England. The school period consists of four hours, from 9.15 a.m. to 1.15 p.m. Beyond this the girls are allowed one hour and a half to two hours and a half home-work. This home-work may be done in school (for which there was special provision made, a mistress being on supervision duty from 2.15 to 3.45 p.m. to help any girls who prepared in school). All practical science lessons necessitating periods of one hour and a half or more were given in the afternoon as a rule, and extra lessons to girls in the Sixth Form necessitated by the examination syllabus were also given in the afternoon, if necessary. This system meant that, except in the case of senior girls, no girl was receiving actual tuition in school subjects on more than one afternoon a week. The results obtained by the Trust's schools are, I think, sufficient evidence of the efficacy of the system. May I also urge here that the age-limit at which girls can enter as pupil-teachers be raised. as it is possible for a girl under the present system to leave the secondary school, and take up her pupil-teachership at an age which gives her such a short time in the secondary school that the benefits derived are practically nil. While speaking of physical culture I should like to say how extremely useful we find the record cards which we keep for every girl in the school are. Defects in sight and hearing, adenoids, and many other weaknesses have been discovered on examination, and reported to the parents, who have shown themselves to be most grateful for the care taken with the girls. Much remedial work has been done, but there is room for still more, and I think that it would be a distinct advantage if this remedial work could be begun in the primary schools, as defects in vision, adenoids, &c., may begin exceedingly early, and if not discovered until the child reaches the secondary school, they may have become acute. Some may argue that this work does not lie in the province of the school, but that of the home; but where parents are unable for one reason or another to attend to these things, I think that we should come to their assistance for the sake of the child. My object in clearing examinations out of the lower and middle school would be a twofold one: Firstly, it relieves the child from much nervous strain; and, secondly, it gives the school a much freer hand in educating the individual. I know that it is urged that examination-work maintains the standard of work in a way in which nothing else does. But it seems to me that should there be any tendency to slackness it would be overcome by the visits of the Inspectors. Personally, I think that every secondary school should be open to inspection on any day of the week, and, provided that Inspectors were men or women of sound judgment, specialists in their subject, and possessing wide teaching experience, their visits would be welcomed; and they, in consultation with the headmaster or headmistress, would scarcely fail to discover and therefore remedy any tendency to weakness in a teacher. If examinations are to remain as inevitable, I would urge that, in the middle school, a large range of subjects be given, but the number to be taken be fewer, and be treated more fully, and that a higher standard in English be adopted especially. Much discussion has occurred about the training of girls in domestic science. To adopt any definite scheme of specialized training in this subject in primary schools seems to me to be adding to the overcrowding of subjects. But much may be done to train the pupils to take an intelligent interest in the affairs of life, and to accumulate useful practical knowledge, by connecting all teaching as far as possible with the details of every-day life. The value of a subject in teaching depends on the extent of its bearing on everyday life, directly or indirectly. May I illustrate my meaning on this point a little? In mental arithmetic the price of foodstuffs, clothing-materials, land, &c., may be introduced; in geography one meets the produce-markets of the world and their fluctuations; in history one can be taught much of one's own political duties; and in English the field of application is enormous, because we come into contact with the thoughts and experiences of the greatest minds in the world. The position of domestic science in the secondary school seems to be much more definite. It opens up a natural field of work for a woman, and one which in this country falls to the lot of every woman, rich or poor. Of the dignity of it I need say nothing, for any course which directly uplifts the standard of home and cares for the health of the community in caring for that of the individual needs no advocate to enlist sympathy or support. To teach cookery and home hygiene, or any other part of domestic science, as distinct school-subjects does not seem to me to meet the need, and also I feel that, in adopting such a course, we should overlap with the technical schools. My idea is to introduce domestic science in a form in which it will be extremely practical, and supply a school want. As many people are aware, schools such as the Grammar School draw many pupils from the country, and the question of suitable boarding-places for these pupils presents a very real difficulty to parents. I purpose, therefore, to lay before the Board the following scheme (which has at present only been discussed by myself and the Treasurer): That a house suitable to contain twenty boarders should be rented by the Board as near the school as possible, and that this house be placed in the hands of a fully qualified domestic science mistress under my own supervision, and that the work of this house, from sweeping and cleaning to finance, afford the practical training for the domestic-science course. In this way I feel that the girls will meet in a natural way the true difficulties of home-management, and learn to overcome them. At the same time the presence of a fully qualified house-mistress and my own daily visits should, I think, safeguard the boarders from suffering any discomfort. I feel that there is another great want in our secondary schools, and that is pure undenominational scripture-teaching. There is no lesson in which direct moral teaching can be given as it can be in a Bible lesson. After school hours much may be done by the few who are willing and anxious to give up their time. But many things occur which prevent the regular attendance of girls at outside classes, and in consequence many girls are debarred from receiving any instruction of this sort. Many parents approve of it, and are glad for the girls to avail themselves of it; and I maintain that it is an important factor in the upbringing of a child. In my own schools, on inquiry among 430 girls,

I found that there were only some sixty refusals on the part of parents to allow them to attend Scipture classes after school, and of these very few objected to Scipture teaching; the majority asked that their daughters might be excused from attending, as they had long distances to travel, and it made them very late in arriving home if they stayed after school. I would have it very clearly understood that the teaching should be strictly undenominational. The teacher cannot alter the facts of the Bible stories, and the lessons to be obtained from these stories are countless and sublime, and furnish a stimulus for the best in human nature. I would not have attendance at Scripture lessons compulsory. Liberty of conscience is every one's right; but I think that the number of those who did not attend would be small in proportion to those who did attend, and I feel sure that a very material help in the tone of the school will have been given, and also a closer union obtained between teacher and scholar. I would suggest that parallel lessons be arranged for those girls whose parents objected to their receiving Scripture teaching. In closing this paper I should like to put in a plea for those who carry on the all-important work of teaching. I feel that they are worthy of a better hire. Teaching, properly done, is an exceedingly exacting profession, and heavy toll is paid by the conscientious teacher for the knowledge imparted to his or her pupils, and also for the training given. I think, therefore, that the material life of a teacher should be made as easy as possible. The salaries given do not admit of much relaxation—they are excellent factors in economy. The cost of living in New Zealand is high, and in proportion everything else is high, and hence I think that professional salaries should be high too. I am not pleading now for such people as myself—I consider that as I was engaged at a definite salary to do a definite work it is immaterial whether my school contained ten or a thousand pupils, I should feel that I was just as much bound to do the work in one case as the other at the same salary. I am speaking on behalf of my assistant mistresses. Individual increments are granted by the local governing bodies as far as possible, I know, but these do not meet the requirements of the case. I think the scale of salaries throughout the Dominion requires to be raised. Teaching will not suffer because teachers are better paid—rather, I think, it should improve.

3. *Mr. Davidson.*] I notice that you suggest a closer correlation between the primary schools and the secondary schools in reference to the course of study. Would you favour the primary, technical, and secondary education of the Dominion being placed under one controlling body in each district?—I would, because it would be continuous in that case.

4. When you speak of conferences of primary and secondary teachers, are you aware that there is an organization known as the New Zealand Educational Institute?—I do not think sufficient advantage is taken of it.

5. Would you recommend that the basis of the membership of the Institute should be widened so that it should embrace both primary and secondary teachers?—Certainly.

6. *The Chairman.*] Would you go further and say that if the control of all the branches of education in New Zealand were placed in the hands of one controlling body the same opportunity should be given to all teachers to meet?—Certainly. I think it would be very advantageous, and would lead to more uniformity of method and a great general improvement in education.

7. *Mr. Davidson.*] Do you not think that if boys and girls were taught together it would tend to refine the nature of the boy and get rid of the silliness and namby-pambyism that is frequently found in girls where they are kept apart from boys?—I do. The question of co-education lies in the hands of the teacher. If the dominant influence of the teacher is sufficient to have boys and girls under his complete control co-education is possible. But there is only one teacher in a thousand who can meet the needs of the boy and the girl sufficiently to bring out the best in both, and to dovetail them together so that they shall reap mutual advantage. My own experience is that the girl under the present system loses much in refinement through mixing so much with her brothers. She is roughened and coarsened in her early years in that way. The fault does not lie in the teacher. He has so many to deal with that it is impossible to look after them. I am afraid that co-education instead of decreasing the silliness rather increases it, because complete supervision is impossible.

8. If the classes in a mixed school were not too large and care were taken in the choice of the teachers, would not co-education be a good thing?—Yes, certainly, if you can get that ideal teacher, the one in a thousand; but I do not think you will get him frequently enough.

9. Do you think that in primary schools where women are in charge of the classes co-education is a good thing?—Only in the case of infants. Just as I maintain that a man cannot meet the needs of the girl, I do not think a woman can altogether meet the needs of the boy.

10. Seeing that young boys and girls while in the infant-room becomes chums and friends, does it not seem hard to separate them when they go into the higher standards? Would you not carry their association a little further than the infant-room?—When I speak of infants I mean children up to the age of even ten. I think that from ten onwards the boys and girls should be separated.

11. In our primary schools the average age in Standard I is about eight, in Standard II about nine, and in Standard III about ten. So you would favour the boys and girls being in charge of a woman until they reach the Third Standard?—Yes.

12. You mention that probationers are generally too young and insufficiently educated before they enter our primary schools?—What I meant to imply was that they have not had time to take full advantage of the course in the secondary schools. They have not stayed long enough in the secondary schools.

13. Would you make it one of the requirements that they should matriculate before becoming probationers?—Yes, particularly in the case of the girl, for under the present system while she is teaching she is also studying. It is a double strain.

14. *Mr. Pirani.*] I think you have been mixing up probationers and pupil-teachers?—I refer to the pupil-teacher.

15. *Mr. Davidson.*] Would you make it compulsory that free-place holders should remain in the secondary school at least two years?—With this proviso: that it should be at the discretion of the headmaster or headmistress. It seems to me that if we gave them a term, or even two terms, of probation we could do much weeding-out which would be of advantage to the child, because we could probably send her to technical classes or something else to greater advantage; and it would also be to the advantage of the school, because we could get rid of those who did not work satisfactorily.

16. Do you claim the right for the headmaster or headmistress in a secondary school to refuse to receive the free-place holder?—After a term of probation; but I think that right should be exercised very seriously—that we should have very good grounds for refusing.

17. It would be placing a great power in the hands of the master or mistress?—Yes, and I think we ought to bring forward very sound evidence that we were right in our decision.

18. *The Chairman.*] Would you be inclined to suggest that that power should take the form of a report to the Education Board?—Yes. Now one cancels a free place only on very grave grounds by a report to the Education Department.

19. *Mr. Wells.*] In speaking of the command of language possessed by the pupils, I suppose you are making conscious or unconscious comparison with the pupils at Home?—Pupils of the same age.

20. And from the same class of homes?—No. I take that into account to some extent, but I think much could be done in the school to bring the atmosphere of the lower school in the English high school or secondary school into the primary method of teaching. In our high schools at Home we begin with the children in the kindergarten, which is a much better introduction into school life than the primary school. It must also be taken into account that they come, as a rule, from more cultured homes. It seems to me that if the children were allowed to talk to the teachers, to arrange their own ideas—to be corrected in diction—they would unconsciously gain greater facility in collecting their thoughts and setting them out. It now takes a long time to get at the real thoughts of the child, and a much longer time to get her to express them in an orderly fashion.

21. You recognize that under our very liberal system of free places we draw pupils for the secondary schools from homes where practically no reading is done, and where children hear very little higher-class conversation: bearing that in mind, do you think the language of the pupils is less refined than you could reasonably expect?—I think we are speaking of two different things. When I speak of command of language I am thinking of the language the children dress their thoughts in. The ordinary every-day language in conversation between child and child is perhaps better than at Home, because they have wider fields of conversation here; but the children's means of expressing what they feel is not as far advanced as it might be.

22. Do you not think the lack of formal grammar is felt in the secondary school when the teaching of a foreign language is entered upon?—Hardly, I think, because we start at the beginning in English grammar with them.

23. You spoke of the waste of time in the case of pupils really unsuited to your work. Would there be any if there were more consultation between the headmaster or mistress of the primary school and the parents as to whether the child should take up secondary or technical work under the free place?—I think that if the parent and the headmaster or mistress and the teacher who had most to do with the child were to meet, you would find that the parent would be willing to be influenced by the teachers, and that much good would be done in that way.

24. And that consultation might be made practically compulsory?—Yes.

25. You think there is a good deal of waste of public money at present?—It seems to me so.

26. When you speak of the syllabus as being wide, do you mean that of the primary school?—I referred to both the primary and secondary syllabus. In both cases we cover too much ground.

27. Could you offer any suggestion as to the way in which the primary-school syllabus might be improved?—To begin with, I am very much in favour of limiting the syllabus with regard to arithmetic. Speaking from our own experience, we would far rather know that the girls coming from the primary schools were well instructed up to vulgar fractions and decimals only, and that we could go on from that stage. But they come to us after going over a very wide area, and we find that we have to go over the ground and unpick other people's work. Also, if we could feel that in the primary schools the children were only reading and learning to express their thoughts clearly, we could work to much greater advantage in English than we do. We do not know what they have done, and after setting a certain course we find that there are gaps which we have to fill up. Gaps are bound to occur until we as educationalists have fought the matter out. In geography, too, we think that many facts are taught in the primary schools, but I would have them deal with certain parts of the world only, and with certain sections of physical geography, but not very much; then let them come to the secondary school and continue the course.

28. Do you find much difference in the standards of work of the children who have come from the large city and suburban schools?—Not so much difference in standard as in quality. The work is of the same standard, but there is a very great difference in the quality.

29. With regard to examinations, do you think it would be possible to combine the Matriculation and Junior Civil Service Examinations?—I do not think so, because at present the standards of the two are quite different, and the syllabuses of the two are rather different; they are aiming at two different ends. I am in favour of the Junior Civil Service Examination being retained as an entrance examination to certain positions to which juniors are admitted, but I think the Matriculation Examination should be what it was intended to be—the avenue to the University course.

30. Are you in favour of no person being engaged as a pupil-teacher until he or she has matriculated?—I am greatly in favour of that.

31. What do you think should be the limit of a secondary school as regards attendance?—I see no occasion for any limit if the schools can be properly staffed. It is as easy to work a school of one thousand, if it is properly staffed, as a school of two hundred and fifty.

32. But could the head teacher exercise the same influence in a large school as in a small one?—One would have departments, and one's influence would be exercised through one's organization.

33. But could there be the same personal influence?—I think you could find time to do a great deal. One advantage would be that for a bigger school one could have a better staff.

34. *The Chairman.*] You think there would be no subtraction of the personal influence of the head teacher so long as the staffing was sufficient to meet the requirements of the enlarged school?—I do think so.

35. Would you be in favour of a Dominion scale of salaries for secondary schools?—I think so.

36. *Mr. Pirani.*] With regard to Scripture teaching: is there anything now to prevent you taking the Bible as an ordinary reading-book in your school during school hours?—I do not think there is. But do you think that that would be putting the Bible in quite the proper position? Personally I would hardly like to bring it into that position.

37. With regard to the tests for pupils entering the school: would it not be much better if, instead of waiting for a period of probation in your school, the test were applied before the pupils went to your school at all—in the school in which the teachers are already familiar with their capabilities?—Yes, but there will be doubtful cases even after that weeding-out has been done. There will be cases of children who give a certain amount of promise and seem to be worthy of secondary education and yet who will fail in the first or second year.

38. Do you not think there ought to be more weeding-out than at present before they come to you?—Yes.

39. If there were one controlling authority for primary, secondary, and technical schools, would it not be a better system for the Inspectors and headmasters to define what the secondary course of each pupil should be—whether it should be in a technical school or a secondary school?—Provided that the controlling body took into consideration the opinions of the teachers.

40. With regard to matriculation, do you not think that a system of leaving-certificates given by the principals of the secondary schools to the pupils they consider sufficiently qualified to go to the University would be better than the present entrance examination?—Yes; but, again, there would be the difficulty of the individual standard.

41. With regard to the question of co-education: do you think there is any real difficulty before the age of twelve, either educationally or otherwise, in co-education?—I do not think that at Home there would be a difficulty, but I think here there would be, because you have to take into account the fact that a girl here matures very much faster than at Home and is much older for her age. A child of thirteen at Home is no older in many respects than a child of ten here.

42. But has a girl of twelve begun to have the physical strain that differentiates her from a boy?—I think so in many cases. We have found that so.

43. From the age of ten to the age of sixteen you think that difficulty would occur?—Yes, I think she should be in the hands of a woman then.

44. Do you see much objection to have it together from sixteen to nineteen years of age?—None at all, provided the girls have been well brought up.

45. *The Chairman.*] I have assumed, rightly or wrongly, that your answer to the question about the inspectorate implied the need for women Inspectors in secondary schools and in the primary schools if the division you contemplate were carried out?—Yes. When I said there is a need for women Inspectors, again I think that the individual qualifications necessary should be only ability. I do not think, for example, we should split the work and say that women should take these subjects and the men those.

46. And in reference to these suggested boarding establishments, would it not be an advantage, if they proved to be necessary, that they should be under the direct control of the Board, and really be a hostel within the school-grounds?—That is to be preferred.

47. Coming so recently from England, I suppose you know something about the practical work of the kindergarten in the primary schools in Liverpool?—Yes

48. Would you, as one familiar with the benefits of the kindergarten, suggest its engrafting on the public school system of this Dominion?—Certainly.

James William Tibbs examined on oath. (No. 17.)

1. *The Chairman.*] What are your qualifications?—I am a M.A. of Oxford, and I am headmaster of the Auckland Grammar School.

2. You have been headmaster for how many years?—Nineteen years.

3. Will you please state what you have to say in regard to the subject-matter of this Commission?—From what I have heard during the last few days I am more than ever impressed with the importance of a sound primary education as a foundation. I think Education Boards should be relieved of the responsibility of managing secondary schools and technical instruction. The Boards are at present elected from School Committees. They should be strengthened by the addition of expert members. I would suggest that other members should be added to Education Boards from superannuated teachers and Inspectors, and that they should be elected by the local Educational Institute. We shall have in the country presently a great body of matured experts in educational matters, and I think the country should make some use of them. With regard to secondary education, I would mention the Auckland Grammar School Board as a very good model for Boards. It consists of ten members—the Mayor, three members elected by members of Parliament for the Auckland District, three by the University of New Zealand, and three by the Auckland Education Board. In this way both university and primary education are

represented on the Board. I think there should be systems of secondary schools throughout the country, consisting of a main central school with several subsidiary schools. I think the latter should receive only junior free-place pupils. I think the main school should be a complete school receiving both senior and junior free-place pupils, and as population increased these subsidiary schools should, I think, grow into main schools. I should like to make a short reference to the waste of effort throughout the Dominion in having small highest classes in many schools. I have heard of a well-endowed secondary school in the South where the number in the Sixth Form consisted of only two pupils, and the most advanced master had to be used to teach these two pupils. I think that is a great waste of effort. I have suggested to my own Board that the new Grammar School should be looked upon as a main school, and that we should have about the Auckland suburban district a number of subsidiary schools. I think, if the Education Board is relieved of technical instruction, that a Technical Board should be formed, to consist of members of the Education Board, members of the Council and Professorial Board of the local University College, and of industrial members. I am in favour of separate Boards, and not of one central Board, because it is to the advantage of the country to have as many of the leading citizens as possible interested in education, and the central Board would thus become too large to be workable. By having power and higher education represented on secondary and technical Boards, there should be no needless competition or overlapping between the several parts of the education system of the Dominion. I would like to say something about vocational schools. I do not approve of the proposal to introduce vocational courses into the secondary schools. Very few boys make up their minds about their future calling until they are about to leave school, and it is well not to hurry them, for frequently they develop quite late in their school career some special aptitude for a particular calling. I am much concerned at the proposal that all our secondary schools should provide courses in agriculture. I have looked into the rural course suggested by the Auckland Education Board and based on the circular from the central Department, and I find that to give a moderate-sized class practical work in these things—in digging, trenching, hoeing, raking, draining, and cultivation of vegetables, treatment of light and heavy soils, succession of crops, study of noxious weeds, the pruning of fruit-trees, the planting of hedges and ornamental trees, and a host of other things—would require all the vacant ground at our present site in Symonds Street as well as the acres recently granted to us at Mount Eden for a new site, and that would be to the exclusion of any share in the ground of all boys not taking part in that particular course. Besides, I am an old gardener, and I have no confidence whatever in the way book-taught teachers of agriculture and horticulture would handle the subject. My opinion of school-gardens is that they are a pleasant hobby for those scholars who are incapable of taking part in school games, but their value to the farming industry is and will remain practically nil; and I think the ground devoted to them would be much better used for fives-courts and other games. Many of our Auckland Grammar School boys are going on the land, and I think that the power to work and think which they have acquired by means of a good general education will be of more service to them in rural life than pottering round plots in the school-yard. I think, if the Government is anxious to further the cause of agriculture and horticulture amongst young people in rural districts, it could do it most economically by means of subsidies to the societies which arrange rural exhibitions, or by offering prizes for fruit, butter, and other products. The idea of school-gardens is not altogether a recent one. It was tried here many years ago by Bishop Selywn at St. John's College. I looked up the life of Bishop Selwyn and I found he had three classes of students. Under the heading of "Active Employments" the classes were as follows: (1.) Gardeners in the lower school: the duties to be—care of the flower-gardens and apiary, weeding, picking, hand sowing, propagation of choice plants and seeds. (2.) Foresters belonging to the upper school: their duties being—care of the woods and plantations and roading, clearing, road-making, fencing, propagation of choice trees, seasoning timber, &c. (3.) Farmers belonging to the adult school, whose duties related to agriculture in all its branches and the care of stock. This was a delightful vision of Bishop Selwyn's, but it came to nothing. There is one thing I would like to say about nature-study in the primary school. I think it may be introduced very much too early, and I think there is a good deal of injudicious teaching of nature-study. I do not know whether the Commission has heard of the story of a child who staggered his parents by objecting to porridge because the grain scratched the alimentary canal, and who, when he had a cold, said his diaphragm was strained; but I have come across an example of that kind of priggishness in the child of a friend of my own. This composition was written by a Standard II child in this province: "Inside the seed coat or testa of the bean seed are the radicle, the plumale, and the seed-cases. At one end of the hilum or sear there is the micropyle or little gate through which come the root and the shoot. The bean plant belongs to the class of plants called dicotyledons—di, many, and cotyledons, meaning seed leaves." I think that is an example of the tendency to priggishness in a child, or in the teacher. I would like to say a few words on where I think the primary school fails as a preparation for secondary work. I inquire year after year of the boys that come to the Grammar School as to how far they have been exercised in home-work, and I find that most of the schools have no home-work, and that the pupils from the few who do rapidly outclass the others. I think it is deplorable that boys of fifteen should be allowed to waste their evenings as many are doing. They have no idea whatever of doing anything for themselves away from the discipline of the school. Most of them are quite willing to do home-work when they get into the way of it. It takes them a little time at first, and the parents, I think, soon grow interested in the boy's progress in home-work. Many of them I find make a good deal of sacrifice to give a boy a room apart from the rest of the family in which to study undisturbed. That is common in very small homes. I think there would be a marked advance and more general parental interest in education if there was recourse to systematic home-work in the primary schools. I have discussed the matter with several headmasters. They say the classes are so large that it would be impossible to look over the written work; but surely

poetry could be learned, and such things as grammar, political geography, history, and more written work done during the day might be corrected at night. I think home-work would exercise a salutary moral influence on the city life: the boys would not be running about the streets so much. Besides, it would help to get the greatest possible good out of our liberal system of education. I think, speaking from my point of view as a secondary-school master, that manual and technical training should be left for continuation classes. I know very little about the primary schools, but it seems to me from what I have seen about the streets that there is too much running about during the day, too much broken time, and that seems likely to be on the increase. If you have swimming, gardening, woodwork, and other hobbies like that in school hours I think the boys tend to get very unsettled. I think there is a great want, again, from a secondary-school point of view, of a little formal grammar. I would not ask for too much. I think the boys should know the parts of speech, and should know the difference between a transitive and intransitive verb, active and passive, and subject and object. I think all should know something of political geography, and certainly the outlines of English history. I have summarized what I think should be the best preparation for us. I think that a boy should read fluently and with average intelligence; work elementary rules of arithmetic with accuracy and rapidity; write neatly and correctly from dictation; express himself in tolerably correct language; know the elements of English history and grammar; and have some acquaintance with the geography of our Empire and the chief countries of the world. I should like to say a word about the teaching of Latin. I see from a report that the Inspector-General introduced the subject. I do not want the Commission to attach undue importance to the opinion of the headmaster of Sherborne School. Of course, I do not know the present headmaster of Sherborne. I remember one headmaster, and the present headmaster I think must be a man of very different type. I wonder whether the present one is a high and dry mathematician who lacks the saving grace of an academic education, or, I was going to say, a classical enthusiast who has been soured by failure to get the average boy to write Latin verse. I was tempted to think that the Inspector-General might almost have forgotten how much he owed to classical education, till I remembered that he still retains a great affection for the poet Horace, having recently presented me with a charming little pocket edition of Horace. I maintain that Latin holds positively the same relation to the literary side of education that the study of mathematics holds to the scientific, and that, if Latin is to be no longer a general subject in higher education, mathematics should also become a special subject. In this way, too, the two most solid subjects of secondary education would be removed at a time when their steadying influence is most needed to save the schoolboy from "being blown about with every wind of doctrine." In my opinion, the main object of education is to enable a person to weigh the best words and thoughts of others with a view to think correctly himself and to give accurate expression to his thoughts. And it seems to me that Latin in the domain of literature, and mathematics in that of science, are as effective educational agents as have yet been found. It is to be noted that two such practical nations as Germany and Scotland have always given Latin a prominent place in their schemes of higher education. The Inspector-General said that in most schools all that was taught was the grammar and a scrap of an author. I have brought here copies of the last terms papers set in two forms at the Grammar School. One is for the Upper VI, and there are nine questions on the paper. Question 3 is on antiquities—viz., "Describe Roman burial customs, and quote from Aen. VI to illustrate your answer." Question 4 is a piece of sight translation, and question 5 is, "Explain fully all the historical allusions in question 4." Question 8 is, "Describe briefly the events of the second Macedonian War, and show how the settlement effected led to the Syrian War." The ninth question consisted of questions of mythology, currency, and legal procedure. In the paper for Form IIIA for the first term this year question 7 is, "Explain—*Tertia vigilia; ad nonam horam; navis longa*. Why did Cæsar invade Britain?" These are questions on the subject-matter, and I mention these to show that in some schools more than mere grammar and a scrap of an author is taught. These papers were set by the classical master, Mr. Turner. I am sorry he was not able to appear before the Commission, but he has prepared a sketch of his work, and I will ask him to send it in. I just wish to say a word about examinations. A good deal has been said about the evil of examinations. I wish to say a word in their favour. I think they are a healthy tonic to both teacher and pupil; without them neither would know exactly where he is. I am sure the average boy enjoys an examination if the papers are not too long; it makes a break in the monotony of school life, and it encourages a boy to make a very useful revision of his work. In the award he has something to show as the result of his term's work. If he cannot always boast of a good place for himself, he has generally a school chum or two whose success brings credit on the little set. I would also say that the speculation as to what questions will be set appeals to the sporting instincts in the boys. I am quite sure that the examination week at the Grammar School is very far from being an unhappy week. As regards public examinations, the great number of our boys take two—one at the end of the second year and one for a leaving-certificate. Of course, those who go on for a University scholarship generally have three, because they go up twice. I do not think that examinations are overdone in the secondary schools. I would like now to say a word about scholarships. There is not the same need for junior scholarships that existed before the establishment of free education, but I think that many should still be given, though of smaller value, for both town and country boys. I think if scholarships of £5 were given for town boys and £30 for country boys—that is, with their free education—it would be sufficient. I think that boys who are able to go home for the week ends should not receive full boarding-allowance, as is now given here. I have known cases where boys actually made a sort of small income out of the boarding-allowance. One reason why I think scholarships should be retained is that it is desirable to stimulate boys to do their best all through the system. I think the hope of getting a scholarship stimulates many a boy who might be inclined to do just enough to get through his examinations. I think it would be very advisable to increase the number of senior district scholarships here. I have always thought that, because senior district scholarships are for boys under sixteen,

and that is just the time when parents are finding it most difficult to keep their boys at school. I do not want to see all the scholarships going to country boys, because there is a good deal of honour and kudos to be got in the winning of a scholarship, and I do not think that should belong exclusively to the country children. As to the age for free places, in the original regulations the age was under fourteen on the 1st day of December, but that was afterwards raised to fifteen. I think that was a very great mistake. I think that if a free place is held on a Sixth Standard certificate of proficiency it should be given to boys under thirteen, and every one older than thirteen should be made to take the Department's examination. I do not think that it should be made too easy. I think boys particularly should be made to work a little bit for these things. Perhaps a country boy might be allowed his extra year. I think boys should be encouraged to come at under thirteen. In that way they would get through their school career very much earlier—many might finish their school career at sixteen, and so go either to the technical colleges or the University much earlier.

4. *Mr. Wells.*] I would like to know your opinion as to the need for a training college for the training of secondary-school teachers?—I like to get into the Grammar School somebody who has had some experience of teaching. We have one young man, who I hope will be a master with us presently, who has been a demonstrator for some time. We generally have two or three demonstrators in the school in our science department, and I get them to take a little teaching occasionally, and in that way they get some experience.

5. Have you had much experience with men who have had training in teaching in the primary schools?—Not a great deal.

6. Enough to express any opinion?—No. Most of my masters have come from other secondary schools.

7. You expressed the opinion that you are opposed to the one authority controlling primary, secondary, and technical education?—Yes, I am distinctly against that. I think it would be far too much to entrust to one body of men.

8. You do not think it would make it easier to obtain trained teachers in the secondary schools—that it would offer openings to men in the primary schools who obtain degrees to get into the secondary schools?—I do not think that would affect it at all. We have a young man just appointed who was through the Training College and had a short experience in the primary school. I think they will come to us now if they want to.

9. Would not such a system also afford more scope to the teachers in the secondary schools by enabling them to go to headmasterships in the primary schools?—Are they debarred at present?

10. They do not appear on the grading-list?—I am not aware that they would want to go to a primary school. I think they would probably apply for a headmastership of the other second schools in the Dominion. The number of secondary schools is growing, and I think they will grow very considerably indeed owing to the free-place system.

11. Would you approve of a Dominion scale of salaries for the secondary-school assistants?—No. I think that should be left to the Boards of Governors.

12. Are you in favour of the accrediting system for children from primary schools of good repute?—No, I am in favour of junior and senior free places being won by examination.

13. Do you find much waste of effort at the Grammar School in the way of boys entering the Grammar School who are not fit for a grammar-school course and who would do much better at a technical school?—I do not think so. I think if they had home work it would be all right. The great trouble is that they are not used to home work, and it is very difficult in the first month or two to get them to do it.

14. Do you think the boys who enter the Grammar School should be under an obligation to spend a certain time there?—No.

15. Do you find that many leave in the first year, and that their cost is practically thrown away?—I do not think a year's education at the Grammar School is thrown away, and not a great number leave.

16. Are you conscious of any overlapping in any way between the secondary and technical schools?—No.

17. There has been some comparison made before us in regard to the standard now and the standard, say, ten or fifteen years ago in the pupils who enter the Grammar School: would you give us your opinion on that point?—Do the best of our primary-school boys now compare favourably with the scholarship boys you got, say, fifteen years ago?—They are equal, I think, certainly. Of course, they vary from year to year. The best boys of this year were noticeably inferior to the best boys of last year.

18. Striking an average?—I should think they are quite equal.

19. What is your idea about the maximum size of a grammar school?—I do not think there should be any limit, but I think it is possible the school may ultimately become very unwieldy. I think the present size of my school is not too great. There are great advantages in having a large school, because you can grade very much better.

20. *The Chairman.*] Given greater numbers, the only thing necessary, in your opinion, would be better staffing to deal with these numbers?—Yes, and a larger building.

21. *Mr. Kirk.*] Quite apart from the additional educational value of home-work, do you think it exercises a good corrective influence?—Certainly.

22. And for that reason as well as the other you advocate home-work?—Yes.

23. Do you see anything in the suggestion that is sometimes made that home-work may detrimentally interfere with the health of those undertaking it?—No, I think there is nothing in that.

24. And your experience bears that out?—Yes. It is very rarely I find a boy ill from home-work, and if I do I very soon let him off it.

25. Do you think that the introduction into the secondary schools and the allowing of boys to take at an early age such optional subjects as book-keeping, shorthand, and typewriting are in the

best interests of the students in the school?—I do not think that typewriting and shorthand should be introduced in the secondary schools. They are technical subjects. We teach book-keeping as an optional subject in the forms where Latin is not taught.

26. Would you let us have your opinion as to the general moral tone of the school, or schools if you can speak of them, compared with the general moral tone that prevailed in the past in your experience?—I think that the moral tone of the Grammar School is decidedly good. I have had experience in an English school and in another school in the Dominion, and I think it is as good here as in England and elsewhere in the Australasian colonies.

27. *Mr. Poland.*] You started by saying you were impressed with the importance of a sound primary education, and later you said you thought thirteen years was old enough for a pupil to pass on to a secondary school?—For the bright ones. I said I thought the Sixth Standard certificate should be the test for a boy under thirteen. I think boys under fourteen should take what I think is the harder test—the Department's examination.

28. Do you not think that boys and girls of the age of thirteen who, after being given a further opportunity, may prove very bright and able children should not have the advantage of an extra year at the primary school?—I think they would do better by coming to us earlier.

29. Would you suggest they should be left longer with you?—Yes. I think the boys who come to us under thirteen have under the present regulations their junior free place extended for a third year if there is any need. I may mention that the Rawling Scholarship-holders—we have two of them generally each year—come to us at under twelve, and they have done very well.

30. For how long have they come?—They generally get a senior district scholarship, and they stay on and get into the University section. I mention that as an instance of children coming under twelve from the primary schools.

31. *Mr. Davidson.*] Do you find that boys coming from the primary schools are somewhat overcome with the work of the secondary schools, particularly in mathematics and languages—the subjects that they have not touched in the primary school?—Certainly not.

32. You do not think it is necessary that elementary mathematics should be taught in the upper standards of the primary schools?—I think it would be a very good thing indeed if it could be taught. I think it would be a very good thing if some algebra were taught there.

33. Do you think it would be possible to teach something of elementary mathematics, such as algebra and geometry, in connection with the arithmetic in the Fifth and Sixth Standards in the primary school?—I should not like to see arithmetic spoiled in any way. It is very necessary that the standard of the arithmetic should be kept up, but I should prefer to see elementary mathematics brought in rather than some of the subjects taught there.

34. I have here a course of study in a high school in which there are three divisions—(1) a classical and English course, (2) a commercial course, and (3) a mechanical arts course. Do you think that would be a desirable course of study in a secondary school?—No, I think the course for mechanical arts should belong to a technical school.

35. But you would have two—classical and commercial—possibly in the same school?—I think they would be very good optional courses.

36. *Mr. Hogben.*] Do you take the view that Mr. A. C. Benson takes, that Latin is a special subject?—I do not. I think it is a subject of general training in secondary schools.

37. You do not think it is a vocational subject?—Certainly not.

38. You do not think that by teaching Latin and other subjects taught at the present time you are really giving a boy a bias towards literature and professional pursuits and away from other pursuits?—No. Some of the best scientists have been good classics. I will give you one example of a good classical training: I will take the Right Hon. James Bryce, who was through here the other day. He is a F.R.S. and a man of the widest possible sympathies.

39. You do not think the best way of getting the most suitable boys for free places would be by consultation between the people concerned—namely, his former headmaster, his future headmaster, and the parent?—No, I think it is impossible to get a consultation.

40. And you do not think that the accrediting system would be the best system?—No, I believe in the examination system.

41. *The Chairman.*] Touching home lessons so far as the secondary course is concerned, are you not aware that there was at one time a considerable outcry on the part of parents against the prevalence of home lessons?—I do not know that the parents objected very much.

42. Are you not aware that in a good many cases the inability of the average father to provide the necessary accommodation for his child, so that he might do justice to himself at home, was the reason for the objection?—I am not aware of it.

43. You said you did not regard swimming as a thing that should be practised in schools, and you spoke of it as a hobby. Now, in a country that is largely troubled with dangerous rivers, do you not think that in the primary schools at all events, and in the secondary schools, swimming should be practised and made a compulsory subject?—I do not think so, in school hours. I think that many lives are lost through people being able to swim a little. They become too venturesome.

44. I understand that you prefer that the administration of the several branches of national education should be undertaken by distinct governing bodies. Have the parents of the children attending your school any representation on the governing body?—None whatever.

45. Is it desirable they should have?—I think not.

46. From the fact that it is suggested that the Education Boards of the future should be directly elected from the people by popular franchise, would that have the effect in your judgment of strengthening the *personnel* of the boards instead of being elected as they now are by School Committeemen?—I think they should be elected by the School Committeemen in preference to the wider franchise.

47. You have no experience yourself of the quality of the men who offer under the present system?—No, I know very little of the primary system.

[NOTE.—Mr. Tibbs's evidence on the subject of sexual physiology will be found in the exhibits in the Appendix dealing with that question.]

AUCKLAND, MONDAY, 10TH JUNE.

RICHARD CROWE examined on oath. (No. 18.)

1. *The Chairman.*] What is your position?—I am Secretary of the Auckland Education Board, which position I have occupied for three years, including a year of temporary secretaryship prior to my regular appointment. I have been in the service of the Board for twenty-nine years.

2. What are the points upon which you wish to address the Commission?—The first point to which I wish to address myself is the staffing of the schools, and intimately connected with that is the question of the scarcity of teachers. There is at present a great scarcity of teachers in the Auckland District. Some sixty-four students were released from the Training College after their course of training at the beginning of the present year. Of these, fifty-eight were absorbed and in employment before the end of February, and before the end of March the remainder were all employed. We have at least 250 uncertificated teachers in the employment of the Board. One of the chief causes of this condition of affairs is what I must call the generous staffing of the Grade 4 schools at one end of the grade. At the other end of the grade the staffing is not at all generous. A school with an average of thirty-six children for the year is entitled to an assistant beginning at £90 a year. We have a number of schools where the average is always about thirty-six—running from thirty-six to forty. Altogether we have 135 Grade 4 schools, and I should say that in the great majority of these the average is less than fifty. One of the greatest causes of the difficulty of finding teachers is the position which was created three years ago by the Act of 1908. Another point that I would like to emphasize is the fact that we have a rapidly growing district, and the regulations make no provision for the case that I mention. I will take a typical case—that of Waihi South. The Board found it necessary to enlarge the school, and the average roll, I think, was from 150 to 190 at the beginning of one quarter. A telegram to this effect came to us from the head teacher, and we proceeded to appoint an additional teacher, and we asked the Department to find a salary for that teacher. The Department informed me that it could not be done, so we had to pay that extra teacher out of the relieving fund. That sort of thing has happened in three other instances. We find very great difficulty in getting suitable teachers for district high schools. The salaries are not sufficiently attractive to get teachers who are really qualified to do the work of these schools. Coming to the question of the size of the district, it is now so large that it is fairly difficult to administer. There is a considerable area of newly settled country between Te Kuiti and Owhango. Settlement is extending on both sides of the railway towards the east and west, and for want of roads the country is exceedingly difficult of access. Several grants have been made for the erection of schools in that district, but we have found it impossible to build the schools for anything like the amount available. In one or two instances the prices exceeded the grants by fully 75 per cent. On account of the want of roads the material has to be packed at a cost of something like 12s. or 14s. per cwt. In one case we found it impossible to build even a shelter-shed school. This is a new idea—a school with a lean-to roof and windows and sarking, fairly comfortable for temporary use, which would ultimately be used as a shelter-shed when they come to build a proper school. It was estimated that these shelter-shed schools could be built for about £80 each, but on endeavouring to carry out the idea we found that in that district it could not be done for the money.

3. *Mr. Hogben.*] What would that school cost to build?—Something like £120 or £130, or possibly £150. The grant of the Department would under ordinary conditions have been a splendid one, but this year the weather broke up early, and we found it impossible to get the material in. Another difficulty to which I wish to refer is that of the free school-books. We found it exceedingly difficult in this district, though we got very fair terms from the contractors, to have the books supplied to the schools within a reasonable time after the beginning of the year. The system also entails a considerable amount of work in our treasury department. The Central Department is not satisfied with a general statement or a grouping of the cost of the books, and altogether the thing is not working at all satisfactorily. We find considerable difficulty in the office in complying with the requests of the Department for returns. It is difficult to get from the teachers the information upon which these returns are based. Take, for instance, the annual examination return. The examinations are to be held in November and December, and the returns forwarded to our office. They are examined by the Inspector, and one copy is returned to the teacher to be kept as a school document. It is frequently the end of March before we have these returns completed in the office. The teachers make very many errors in filling up the returns, and consequently they have to be returned to the teachers for correction. It is nothing uncommon to have a return sent back two or three times. Sometimes as many as three or four letters have to be written to the teachers asking for the returns. Part of the trouble, of course, is due to the fact that the annual holiday occurs in December and January, and we cannot get at the teachers sometimes until the middle of February. These are all the points I propose to bring before the Commission.

4. *Mr. Pirani.*] Are there any other returns with which you have difficulty?—The quarterly return under the heading of "Number according to Age and Classification" gives more trouble than any other, on account of the amount of detail to be filled in, and the small amount of space given in the form for writing those details. Some of the teachers do not write microscopically, and there is difficulty in finding room for the particulars required.

5. Is there any necessity for giving these details every quarter?—As far as I understand there is no necessity in the first three quarters of the year. The figures are required for the parliamentary return at the end of the year. I should think that if a special return were made for the December quarter that would give the Department sufficient information.

5A. Is there any other part of the return that you think is unduly harassing?—I do not think so.

6. Is not the return of salary that is forwarded to the Department unduly extensive?—It entails a considerable amount of work.

7. Could that work be curtailed?—I think it might be left to the Board to give the amount of salary paid in bulk, simply stating the total amount of salary paid at each school.

8. Do you know of any reason why more than that should be required by the Department?—No.

9. Do you find that as the result of so much detail being required there are many mistakes or misreadings made by the Board and discovered by the Department?—In the first quarter there may be half a dozen instances of readjustment. After that there are very few.

10. Could these readjustments be made without this detail return? Suppose you simply gave the total for each school, would it not be possible for the Department to make the readjustment from that?—I do not think the Department could deal with individual cases.

11. Then you think it is necessary that in the annual return the individual name should be given?—I do not think very much hardship would result. The teachers are alive to their own interests, and they have the Educational Institute behind them. If they think they are aggrieved in the matter of salary they soon let us know. Any grievances generally arise from the interpretation of the regulation.

12. Do you think the return is required to safeguard the revenue?—I do not think so. I think the Boards sufficiently safeguard the revenue. We are not inclined to pay teachers what they do not earn.

13. Could not a great deal of the safeguarding that is done by the Department be just as well done by the Audit officers when they are examining the accounts in the Board's office?—I think so.

14. Would not post-audit sufficiently safeguard the Dominion finance?—Yes, if the regulations with regard to salaries and schools were clearer and the auditor were thoroughly conversant with them. I think your contention with regard to post-audit is quite right, but I do not think that even the auditor could always find out a mistake.

15. *The Chairman.*] Leaving out the question of interpretation of the regulations, could the auditors do the work thoroughly in the form suggested by Mr. Pirani?—I do not think so.

16. *Mr. Pirani.*] Can you suggest any alteration in the system that would be satisfactory?—I cannot.

17. With regard to new schools: do you think that the information required by the Department is harassing?—In many cases it is impossible to furnish that information. The Department has to be content without having all the information required in 30 and 30A duly verified. It would take a week to get the full information in some districts.

18. If the requirements of the Department were carried out, would it put undue expense upon the Boards—such, for instance, as getting the Inspector to certify to the correctness of the information by a personal visit to the district?—The Inspector always visits the district with regard to new schools.

19. Is there any improvement you could recommend to simplify the application for new schools?—No, excepting that the Department might look upon the Inspector's report as final in the matter. Instead of that you know that in some cases the Rabbit Inspector, or the Sheep Inspector, or the Mining Warden, or the Crown Lands Ranger, or some other officer is asked to give information with regard to the details already supplied to the Department.

20. *The Chairman.*] Are they really asked to report upon the Inspector?—Well, to corroborate or otherwise the Inspector's report.

21. *Mr. Pirani.*] Do you know of any instance where, as the result of the Department's inquiry outside the Board, a grant has been made?—I cannot say there has been any instance.

22. So that, taking all the work done by the officers of other Departments, you do not think they have had any effect?—It has had practically no result except in a few cases with regard to the sites of schools. In those cases the result has been to put the school on the wrong site.

23. Then it has really been detrimental?—Yes. I may mention one instance in which I recommended a site for a school at Waikino—a beautiful site on a flat across the river. The matter was referred to the Mining Warden. His objection was that the children in going to a school erected on the site recommended by me would pass through the reducing-works and eat cyanide and be poisoned. But there is nothing to prevent the Waihi Company from prohibiting the children from going through their works. In fact, it would not be convenient for them to go through the works. However, as the result of the Warden's report the school was built on the top of a hill 350 ft. high, where it gets the noise of the battery, and extra cost is entailed in making and maintaining paths up the hill.

24. Have you considered the question of placing all the primary, secondary, and technical schools in the district under one central authority?—I have considered the question, and so has the Board. The Board is very strongly in favour of placing technical education under the control of an associated Board—that is to say, technical education pure and simple. The technical instruction given at the primary school would still be under the control of the Education Board.

25. And what about secondary education? Does not that concern you, seeing that so many free-place pupils go from the Education Board schools?—I have not considered the question. We have quite enough to do in looking after the primary schools in this district.

26. What is your experience of the present regulations as to the capitation for conveying children to school?—I think that in nearly every case the capitation allowance is insufficient.

27. Would it tend towards the establishment of larger schools if the distances, instead of being three or four miles, were the same as the distances in regard to compulsory attendance—two miles and three miles? Would not that reduction be an advantage?—No doubt it would be an advantage to the children, but it would have no effect upon the establishment of larger schools, because children living within two miles have to attend school whether payment is made for their carriage or not.

28. What do you think would be an adequate payment for the conveyance of children to school?—In every instance where I had to go into such questions when I was an Inspector the offers for the carriage of children, even in reasonably favourable circumstances, were from 75 per cent. to 100 per cent. greater than the amount the Department was willing to pay. I think that was almost invariably the case.

29. Would it be a better plan if the Education Board were allowed to arrange the system of conveyance, subject to the approval of the Department, without limit as to the amount of capitation?—If it were subject to the approval of the Department I do not think it would make very much difference.

30. There is an arbitrary rule now as to an allowance of 6d.?—It would be an advantage if that arbitrary amount were cancelled, and each case were considered on its merits.

31. With regard to the returns for scholarships, do you not think the returns required at present are too diffuse, and could be simplified?—I do not think the details required are at all necessary. If the number of pupils holding scholarships were sent to the Department, that should be quite sufficient.

32. With regard to the supply of free school-books to small schools: could there not be an improvement in the direction of providing certain books for grouped classes?—I think that would be an improvement.

33. Would it not do away to a great extent with what is at present waste?—Yes.

34. What is your system with regard to the supply of school stationery?—We make an allowance of about 6s. 3d. per scholar to the Committee, and the teachers buy what is necessary.

35. Is not that an extravagant method of securing supplies?—I do not know of any better method.

36. Could not the cost be considerably reduced if the Board purchased the supplies wholesale and distributed to the schools?—In a district like this it would be necessary to have a special office and a special clerk.

37. Could you not do it cheaper than through the ordinary medium of wholesaler, retailer, and sub-retailer?—I do not know how you would keep a system of check on it.

38. Suppose you ascertain the cost of what stationery would be supplied, and the capitation allowance to the Committees were reduced accordingly, would there not be a saving to both the Committees and the system of education?—I do not think so. We considered that question.

39. Could not a dozen gross of pens be obtained at a cheaper rate than a single dozen?—Yes, but you would lose so many in distributing them that that advantage would be lost.

40. Have you made any comparison between the salaries of the district high school secondary assistants and those paid to the secondary assistants in the secondary schools?—I know that the salaries paid to the assistants in the Auckland Girls' Grammar School are not very high.

41. They do not compare favourably with the salaries of the secondary assistants in district high schools?—Fairly well. In the junior portion of the Girls' High School there are M.A.s, B.A.s, and Bachelors of Science getting salaries of about £120 a year, but that school is not under the control of our Board.

42. How do the salaries paid to the district high school assistants compare with those of the primary assistants in the same school?—Not at all well.

43. Would it not be a fair thing that the secondary assistants in the district high school should be paid as much as the first assistant in the primary department?—They should receive salaries equivalent to those of the primary assistant.

44. *Mr. Wells.*] Do you not think that additional help in the case of growing schools is not given quickly enough?—That is the general experience in the Auckland District. We have occasionally to provide an assistant in a growing school for one quarter out of the relieving fund.

45. Do you think it would help matters if the regulations were so amended that if at the end of a quarter in the case of a growing school the Inspector certified that in his opinion the school was in a stable condition and help should be given at once?—I think the help should be given. The monthly return of average attendance is quite sufficient to give information as to the assistance required without waiting for the Inspector's certificate.

46. Would you approve of the suggestion to import young trained teachers from Home?—Certainly.

47. Do you think that the Native schools might with advantage be brought under the control of the Education Board?—I do not know that there would be any advantage.

48. Could not the work be undertaken with inspectoral assistance?—The Inspectors could undoubtedly do the work, but I think a man who is inspecting a Native school requires some special knowledge. I think he should understand Maori in order to get at the real state of affairs.

49. It is stated that the cost of building is heavier in Auckland than elsewhere in the Dominion—that the tenders received are often largely in excess of the amounts allowed by the Department?—That is frequently our experience. The other day we got tenders under the grant for a £3,000 school. The actual tender was £3,330.

50. *The Chairman.*] Is that a rare or the usual experience?—Recently it has been an unusual experience.

51. *Mr. Wells.*] Can you offer any explanation of the high prices prevailing in the district?—No.

52. With regard to the conveyance of pupils to a central school: is it not a fact that that system is not carried on to any extent in this district?—I do not think there is any instance in this district. When the idea was first mooted the Department made its success impossible by insisting that no existing school should be interfered with. There were several instances where the Board might have amalgamated schools.

53. *Mr. Pirani.*] Is it not that the Department will not convey the children if they can conveniently get to an existing school?—In the original circular it was made absolute. The attitude of the Department has been against centralization.

54. *Mr. Wells.*] Can you offer any opinion as to the Inspectors being placed under the central Department?—When I was an Inspector I wanted to be under the central Department, but now I think otherwise.

55. Do you think the Inspectors should be paid according to a Dominion scale?—I think the salary of an Inspector should not be less than that of a headmaster. I would be inclined to say that it should be more, but I recognize that in the Auckland District many headmasters of large schools would decline to accept an inspectorship, because of the hardship involved in that position. A man requires to be in the prime of health and strength in order to stand the strain. But an Inspector should certainly be paid as much as a headmaster.

56. If the life is so hard, is not that an additional reason why an Inspector should be well paid?—That is so. My point is that some headmasters could not possibly do the work on account of the strain.

57. Has the grading scheme in this district been a success?—Not an unqualified success, but it has been a success.

58. You think that the present conditions are distinctly ahead of those that formerly prevailed?—Decidedly.

59. From your long experience as an Inspector would you say that the syllabus required simplification?—Yes.

60. In what direction?—It should be made up in a much less complex way, so that the teachers could understand exactly what they are required to do in the various grades of schools. It is more important to the sole-teacher school—the Grade 4 school—than to the others, where the headmasters are responsible for the interpretation to some extent.

61. In what way might the work be lightened?—I have not thought much about that. I feel that the syllabus could be simplified, but I cannot go into details.

62. Can you offer any opinion as to the success of taking into the Training College students who have had no previous experience in teaching?—I have had some experience with teachers who have been through the Training College, and that experience has been decidedly unfortunate. I think the students themselves were placed in an unhappy position. They did not seem to know either the theory or the practice of teaching. I speak now of Division B students who had matriculated and gone through the Training College without previous teaching experience, and after their course of training had been sent out to teach. My knowledge of them dates back to the time when I was an Inspector. I have had some indirect experience of them since, and I think it is an unfortunate position for any person to be placed in.

63. *Mr. Kirk.*] Does not your district adjoin Hawke's Bay?—We go to Opotiki, and the district has lately been extended for thirty miles beyond Opotiki. There is a no-man's land between us and the Hawke's Bay District.

64. Can you work the district satisfactorily?—Yes, the roads are reasonably good.

65. Would it be in the interest of education if the Auckland District were curtailed in that direction?—The district is not at present too large. It is quite large enough, but it is not too large in that direction. We have comparatively easy access to Opotiki; there are goods roads from Rotorua. The Bay of Plenty is considered the plum of the Inspectors' districts in the Auckland Education District. It is the most easily worked, has the most comfortable travelling, and the best climate.

66. *Mr. Thomson.*] Has not the clerical work in connection with returns increased in recent years?—Yes.

67. Is there not more departmental correspondence—greater supervision by the Department over the operations of the Board—than there was ten years ago?—Yes, considerably greater.

68. May not a teacher be uncertificated and at the same time do good work?—Several uncertificated teachers do excellent work.

69. Supposing that all the teachers were certificated, would they be content to go to out-of-the-way places for the salaries offered?—They would go if there was nothing better offering.

70. May it not be that it is because the salaries are so low in the case of the backblock schools that you cannot get certificated teachers?—The real cause is that the certificated teachers are not here.

71. How many district high schools are there in the Auckland Education District?—Eleven, with 299 scholars.

81. Are these district high schools a success?—It depends upon what you consider is a success. Some educational enthusiasts would not consider them quite a success. The majority of them are for the purpose of getting students through the Matriculation and Junior Civil Service Examinations.

73. Have you closed any district high schools since the inauguration of that system?—We frequently close them when they dwindle away for want of attendance.

74. How do you deal with School Committees when they apply for works incidental to the maintenance of outhouses, fencing, gravelling, &c.? We provide shelter-sheds, fencing, and all the repairs generally necessary in the way of maintenance. For improvements to grounds and gravelling we usually make a pound-for-pound grant, but we sometimes pay the whole cost, if the circumstances of the Committee are such that the Board consider it advisable. There is no fixed rule as to the improvement, but generally half the cost is granted.

75. Is not the statutory grant to School Committees 5s. 6d. for each child in daily attendance?—We are paying 6s. 3d.

76. Do you find that sufficient for the Committee?—It depends on the Committee. Some Committees have good balances in hand, but others are always coming to us for grants. I think that, on the whole, under ordinary circumstances, the grant is sufficient.

77. Do the Committees complain much?—I think the majority of the Committees do not complain.

78. Does the 6s. 3d. make reasonable provision for the wants of the Committee?—I think it is sufficient to find what we require them to do, with reasonable economy.

79. What is the state of your fund for the reinstatement of schools?—We have £13,000 on fixed deposit for the purpose.

80. Do you ever draw upon that fund for carrying on the ordinary maintenance-work?—We draw upon it for the ordinary maintenance of buildings and the reinstatement of buildings.

81. If you are always trenching upon that fund, will it not disappear in course of time? Are you making provision for the time when you will have to reinstate a lot of your wooden buildings?—Yes, we have the £13,000 on fixed deposit for that purpose. We recognize that the maintenance and reinstatement fund is one fund for two separate purposes. We have also been able to find out roughly what was given for maintenance and what was given for reinstatement. I think that about half the fund is for maintenance and the rest for reinstatement. That is the way it works out with us.

82. Is money paid for primary education ever spent on technical education?—Yes, indirectly. We are paying out of the primary fund for some prizes for school-gardens, which really come under the technical. I cannot remember any other instance.

83. Why do the Auckland Education Board want to put manual and technical instruction under an associated Board of Governors?—Because the members of the Board feel that they cannot attend to the matter as it ought to be attended to. The Board meets fortnightly, and has a large amount of business to deal with. In connection with manual training and technical education there is a special order paper submitted by the Director. It is also felt by the Board that if the local bodies had representation on an associated Board they would take considerably more interest in the matter than they do at present, and would probably subscribe to the funds for technical education. I believe that any moneys they subscribe would be subsidized by the Department, so that there would be more funds available for technical education

84. You think it would be advisable to place all forms of education under the control of the Education Board?—I do not think so.

85. You think that separate controlling bodies make for greater efficiency?—I think so. Of course, it depends upon the amount of interest the controlling bodies take in their work. It would be too large an undertaking for the Auckland Education Board to carry on the administration of all forms of education in the district.

86. Speaking generally, have you had any great objection to the giving of instruction in woodwork in the Auckland District?—Frequently there is objection. When a new technical centre is being established at which the children can attend, many of the parents and some of the teachers object, but the objections soon die away, and after a few weeks they are rather pleased with what has been done in the matter.

87. *Mr. Poland.*] Do you not think it is advisable in a mining township, where a school-site chosen by the Department or an Inspector might be one that in a short time would require to be resumed for mining purposes, that the opinion of a Warden should be obtained, seeing that mining sites can be resumed without compensation?—It would be wise to obtain the opinion of a Warden, but in my experience I would not like to follow it.

88. *Mr. Davidson.*] You think that the chief cause of the scarcity of teachers is the defective scale of staffing in schools of Grade 4, with average attendances of between thirty-six and eighty?—If that condition of affairs did not exist we would be very much better off in the matter of teachers. So many assistants are absorbed in the schools of between thirty-six and eighty that there is no supply of female assistants left.

89. And would not that cause affect the schools throughout the Dominion?—Undoubtedly.

90. What means would you suggest to remove that defect in the scale of staffing?—I would recommend that a pupil-teacher be placed in a school of from thirty-six to fifty.

91. I suppose you are aware that the pupil-teacher system has been condemned in most countries that are considered progressive in regard to education?—I am perfectly aware of that, and at the risk of being considered retrogressive I say I am convinced that that solution of the problem is a good one.

92. You say that this district is difficult to administer. What change would you suggest in order to overcome that difficulty?—When the Stratford–Ongarue Railway is completed I think that the Taranaki Board should administer the schools in the Ohura Valley, which are most difficult to get at. I would suggest a readjustment of the boundary between the two districts.

93. You said it was not possible to build shelter-shed schools for £80. Did the Board suggest what amount was necessary?—I think the Department granted us the full amount that we thought would be necessary, but when we came to proceed with the work we found we could not get it done at anything like the amount. If it could have been done in January it might have been done within the estimate, but the bad weather came in early in the King-country, and made it almost impossible to do any work of the kind. As a matter of fact, I think the roads in the King-country have been broken up for eighteen months. They did not dry properly last year at all.

94. You spoke of the difficulty of getting the quarterly return made up. Do you think that if the Inspectors, in the course of their round, explain to the teachers how very simple this return is when really understood we would have many mistakes?—I do not think it would make any practicable difference. If the Inspectors spent their time in explaining regulations they would have none left to devote to the real work of the school.

95. Is not too much made of the difficulty in connection with this new form of return?—The difficulty exists.

96. Do you not think that five minutes' explanation by an Inspector to an inexperienced teacher would make the matter quite clear?—I do not think it would be of the slightest value. There are so many things in connection with regulations to explain to the teacher.

97. Looking through the Education Report, E.–2, 1910, I find that the increase in the cost of administration since 1902 has been from £29,000 to £41,000, or about 30 per cent., whereas the increase in average attendance is just half that. Can you give any reason for that marked increase?—I cannot. I think that in the Auckland District the increase in the cost of administration has not been very rapid.

98. *The Chairman.*] Do you wish us to infer that Auckland is not responsible for the increase beyond the natural increase?—The returns show that our percentage of expenses has decreased.

99. *Mr. Davidson.*] As an Inspector and as secretary, would you say that the amount of work, particularly in connection with the returns required by the Department from the Boards, has largely increased?—There is no question about that. I think it has doubled at least.

100. Would not that account largely for the increased expenditure on administration?—It would undoubtedly have some effect.

101. Do you know of any Education Board in New Zealand which has handed over the control of the manual and technical classes in schools to an outside person or body?—No.

102. Do you know that only 43 per cent. of the schools in Auckland carry on manual work, whereas in Southland the proportion is 97 per cent?—I can easily explain that. It is not possible for many of our backblock schools to do manual work. The number of pupils who would be available for it would not be sufficient to give them any capitation.

103. But in Southland every school takes manual work, and it is stated in the report on technical instruction that in Wanganui District 93 per cent. of the schools take it?—We have altogether about 570 schools in operation—I suppose, about 200 of them are in Grades 0 to 3. In each of those schools there is a sole teacher. Frequently the classes are not large enough to earn any capitation. That accounts for the small percentage shown in the returns for the whole district.

104. Then is it more a question of earning capitation than of the efficiency of the schools?—My opinion is that if the teacher in a small school, working alone, does good work in the "three Rs," with a little moral instruction and a little nature-study and civics, he has quite enough in hand without doing manual work. I certainly never insisted on their doing it when I was an Inspector. I did not think it fair.

105. *The Chairman.*] Would you go the length of saying that manual work should be excluded from the primary-school syllabus?—No, because very valuable work can be done in the large schools.

106. *Mr. Hogben.*] In the old form of Return 8 was there not one table showing the number of pupils according to ages and another showing the arrangement according to classes?—Yes.

107. In the new form to which you have taken exception how many tables are there?—One. I would like to make it clear that my chief objection to the new form of return is that the spaces left for filling in the figures are too small.

108. Well, if the spaces were larger would you object to it?—I would rather not have to do it at all.

109. Does your Board ever by inadvertence claim too much from the Department for a teacher's salary in making its returns?—Possibly. We have also on one or two occasions claimed too little.

110. If too much was claimed and the readjustment was made at the end of the year would it not be a hardship for the teacher to have to refund the difference?—Of course.

111. How would you simplify the form of return?—I do not know. I simply made a general statement that it should be simplified.

112. Could you give any indication of the salary you think sufficient for an assistant in a secondary department in a district high school?—About £250 a year.

113. Would you give the average assistant in a district high school secondary department a higher salary than the average assistant in a primary school?—They have not been paid sufficiently in the secondary schools, and I should certainly say so. We could have attracted a fair number of good men who have gone to other places for about £250 a year. I doubt if you could do it for less, but we might offer £225 a year.

114. Suppose you gave £225 a year; then, with other expenses, how much would a district high school with a minimum of twelve pupils cost per pupil?—I do not think there is any district high school in Auckland with a minimum of twelve pupils. About twenty is the lowest.

115. Can you refer me to the circular that prevented the Board from closing a school in order to establish central schools?—I think we have such circular in our office.

116. Is it the circular relating to the conveyance of pupils?—Probably.

117. Has the Department ever opposed the closing of a school when it was proposed by the Board with a view to the establishment of a central school?—I do not think the Board ever made such a proposal, considering the information at their disposal. They thought it useless to make any such proposal.

118. Did the circular relating to school-books allow any grouping of the classes for school-books?—Yes, some provision for grouping was made in one of the circulars—I think it was the last one. There are so many of them.

119. How many circulars are there each year in regard to school-books?—I should say one each year. I was referring to correspondence rather than circulars.

120. Does that circular allow the grouping of classes for text-books?—I think one of the circulars does.

121. *The Chairman.*] I wish you to go a little deeper into this matter of the preparation of returns. It is the fact, is it not, that the Boards are called upon to supply full details each quarter showing the name of each scholarship-holder, the annual value of the scholarship, and the amount due for each quarter?—Yes.

122. Could that not be simplified by tabulating the number of scholarships, the value, and the amount due quarterly—restricting the return to these three columns?—Yes, I think so.

123. Now, in regard to the returns relating to teachers' salaries and the staffing of schools, is it not the case at present that the Boards have to supply full details regarding the staff of each school—to wit, the names of teachers, classification, rate of salary, &c.?—Yes.

124. Would it not be sufficient if the total amount required to pay salaries in each grade were supplied, so as to afford a basis on which the Department should pay—namely, a return showing, first, the number of the grade; second, the number of schools in each grade; and, third, the amount of the salary within the grade?—Yes, I think so.

125. And as to the conveyance of children in order that they may attend a central school in out-of-the-way places, is it not the practice for Boards to submit in the case of each family a proposal of this kind to the Central Department?—Yes.

126. As there are rules for the guidance of the Boards with regard to distance and rate, should not the Education Boards be allowed instead to furnish the Department with a certified claim at the end of each quarter of the amount due?—I think so.

127. That would be a simplification in the right direction?—I think so.

128. Touching the nomenclature of schools, is not the tendency to call schools "district" and "district high" rather confusing, in that some schools claim to be high when they are really not the highest? Would it not be better to have a grade school, as in many other countries, after leaving the primary?—I think it would simplify matters. At present we distinguish them fairly easily by calling them secondary and district high schools.

129. Touching the inspectorate of your district, is it the custom to keep all your Inspectors in the centre and work them from the centre?—They all have their homes in Auckland. There are seven districts, and we have eight Inspectors, and the eighth man takes up work in districts that the other Inspectors cannot overtake. I think it is the intention of the Chief Inspector to make the districts correspond with the number of Inspectors. That is the most satisfactory method.

130. Do you, as an old Inspector, favour such a proposal?—I favour that proposal, but I do not favour the proposal that an Inspector should reside in his district. That did happen on one occasion and it was not at all satisfactory. An Inspector must be in closer touch with the office.

131. If you send junior Inspectors into the out-districts, what objection is there to gradually bringing them nearer to the centre by reason of length of service and efficiency until they ultimately get to the centre, and grading the salary as at present?—That is the principle adopted now. The man last appointed takes the undesirable districts in turn. In time he works into a more comfortable district; but to appoint Inspectors to reside in the districts here would be hardly practicable.

132. Inspectors of Police do not find that a drawback: why should an Inspector of Schools?—There is no Inspector of Police residing outside Auckland.

133 In your judgment, has the time arrived when schools, such as the Girls' High School, that are entirely controlled by women should be examined by women Inspectors?—I do not think it is at all necessary.

134. You think the abolition of the pupil-teacher is a retrograde step and should be reconsidered?—I think so.

135. Would you acknowledge Mr. Frank Tate, Director of Education in Victoria, as a reliable authority on matters educational?—Yes.

136. Would you subscribe to his opinion: "Undoubtedly this system [of training pupil-teachers] did good work in its day, and the teachers who survived the great strain which it imposed on them during their apprenticeship acquired great power in practical teaching within a very definite and restricted area; but we must not be blind to the fact that outside Australia all the countries that adopted the pupil-teacher system have now abandoned it in favour of one which gives fair conditions to the young teacher, and which must provide in the end a trained teacher of larger culture and greater individuality, and with more advanced power of doing his work. The teacher now aimed at by all progressive countries is one to whom a greater scope for individuality and initiative can be allowed than is possible under the pupil-teacher system"?—I have read reams of stuff like that, and I could write it too. I think many of the countries he talks about as having abandoned the pupil-teacher will yet be glad to go back to that system. I think they will find it necessary to go back to it.

137. Mr. Tate is a teacher of great repute who has travelled extensively and studied this subject, and he gives that as his studied opinion, and you say he is wrong in your judgment?—Yes.

THOMPSON WILSON LEYS examined on oath. (No. 19.)

1. *The Chairman.*] What is your position?—I am a journalist residing in Auckland.

2. You are a member of the executive of the Libraries Association in New Zealand?—Yes. I was president last year, and am now vice-president.

3. I understand you wish to place before the Commission your views in regard to libraries in connection with the public schools of the Dominion?—Yes. My chief purpose in coming before the Commission is to urge that adequate provision be made for school libraries. While we claim pre-eminence for our system of national education, in this respect we are altogether behind the times. I claim that school libraries, as an important branch of free public libraries, should be regarded as an integral part of the education system of the Dominion. In the cities of Great Britain education and libraries are managed by committees of the Corporation, and there is consequently no conflict regarding the liability for paying for these public services. The free issues of books from juvenile departments of the public libraries are, with few exceptions, considered sufficient to meet the requirements of schools. The juvenile books are carefully selected and the circulation large. For example, at Fulham Library, which may be taken as representa-

tive, out of 103,809 books circulated from the lending branch for the year ending March, 1911, 28,583 were issued from the juvenile department. In other cases—as, for example, Cardiff—the American plan of supplying school libraries from the central library and its branches has been adopted with great advantage. The volumes lent from schools provided in this way increased from 153,528 in 1900–1 to 282,711 in 1907–8. Adding the circulation from the public libraries of Cardiff to that from the school libraries, there was a total issue of 397,435 books of juvenile literature, as compared with 367,973 books circulated from the adult divisions of the Cardiff libraries, showing what an important place juvenile-library work occupies in a well-administered public-library system. The whole cost is borne by local taxation. In the United States of America public libraries have, however, attained the maximum of efficiency, and it is there we find the school library worked as a definite and important part of the system of education, and maintained entirely at the cost of the taxpayer. The system of administration varies in different States, but, speaking generally, it may be thus described: In towns some twenty or thirty sets of books, forming small libraries, are made up at the central library. They are distributed among the various schools, and exchanged at intervals. In some towns a teacher may make a selection of books for his school, either from the catalogue or at the library. In many instances books suitable for each standard are made up and used as readers in the various classes. But the school library is usually drawn upon for that purpose, increasing the interest in this branch of school-work and giving greater breadth to the literary instruction covered by the syllabus. Besides this, photographs and pictures are supplied. In Milwaukee surplus illustrated papers in the city libraries are made use of; the best pictures are cut out and pasted on sheets of manilla paper of uniform size, and arranged in sets of from twenty-five to fifty pictures, put in portfolios, and lent to teachers of the city schools. The pictures are selected mainly with a view of cultivating the æsthetic sense of children. In Boston, United States of America, the Free Public Library supplies 108 public and parochial schools. Not only the central library, but each of the branches and reading-rooms is a reservoir from which books are drawn for use by teachers in schools in its immediate vicinity. This applies also to photographs and pictures of different kinds, mainly for use in schools in connection with the work of the teachers. These collections consist of illustrations of fine arts, physical and commercial geography, coloured views of all countries, types of people, industries, transportations, &c. In November last one branch issued 200 pictures in this way, another 350, another 822. From the branches and reading-rooms about 360 teachers are supplied with books for use in their work, and the school circulation is over 80,000 volumes a year. In New York, in the year 1905–6, there were 485 elementary-school libraries, comprising 509,965 volumes, and circulating nearly six million books yearly. The cost was borne by an appropriation of £5,544 from the city and an equal amount from the State. Compared with the circulation from the adult libraries of New York, the children in school attendance borrowed ten books to one borrowed by adults. This affords evidence of the encouragement given to reading under a comprehensive system of school libraries, and I venture to say that no better endowment can be given to the rising generation than a love of reading, which furnishes the key to vast stores of knowledge. These statistics proved that, apart from the advantage derived from wholesome supervision of juvenile reading by teachers, the provision of good school libraries enormously assists in the diffusion of knowledge through the medium of well-selected books. It cultivates a good taste in reading, and affords the best antidote we can get for the "penny dreadful" class of literature which does an infinite amount of harm among boys. Coming to New Zealand experience, I may direct the attention of the Commission to the fact that under a free issue of juvenile books from the Dunedin Public Library there are 797 borrowers now on the roll, whereas in the older city library of Wellington (including the Newtown Branch), where a subscription of 2s. 6d. a year is charged, there are only 400 juvenile borrowers, and in Auckland, where the charge is 5s. a year, the juvenile borrowers at the two municipal libraries number only forty-five. I have had under my observation during the last three years in our juvenile reading-room at the Leys Institute an attendance of from fifteen to fifty boys, all of whom are either now attending or have passed through the primary schools, and I have been surprised at the utter lack of interest in reading, although the most attractive forms of boys' books and periodicals are placed at their disposal. In the absence of this inclination, primary education practically stops short when the pupil leaves school. Last year, as president of the New Zealand Libraries Association, I issued a circular showing what has been done with regard to school libraries elsewhere, and submitting an estimate of the cost of inaugurating a complete system for New Zealand. This circular was issued, with the approval of the various Boards of Education, to a majority of the School Committees throughout the Dominion. Calculating on the basis of 42,475 children in Standard IV and higher standards, and providing one book costing 3s. for every pupil on the school rolls for these standards, the initiation of the system would cost £6,341 5s. The Hon. George Fowlds, Minister of Education, in a memorandum which he permitted me to embody in this circular, stated that probably the average cost of any adequate supply of sets of books for school libraries and their proper distribution would be not less than 1s. per pupil per annum—three times as much as it costs in New York. According to this estimate, 50,000 pupils could be provided with a book apiece at a cost of £2,500 a year. In October last, as the outcome of two informal conferences of Inspectors of Schools and some of the head teachers of schools in and around Wanganui, a scheme was drawn up to provide library sets for nine schools in Wanganui and its vicinity. The cost of establishment was estimated at about £180, or 2s. 11d. per pupil, while the sum of £80 per annum, or 1s. 3d. per pupil, would be required to keep the scheme in operation. I have not heard whether this scheme was proceeded with any further. In Wellington, however, the City Council authorized the Librarian to supply the Clyde Quay School with books free, with very satisfactory results, but it is unlikely that the Council will authorize an extension of this system at the cost of ratepayers to other schools, so long as a charge

is made to borrowers from the city libraries. In Dunedin and other places where the Corporations have undertaken to provide free books, I can see no good reason why the aid of the teachers should not be enlisted in circulating the books provided for juvenile readers. With regard to the inauguration and management of a complete system of public and school libraries in New Zealand, after careful consideration I have come to the conclusion that it can be most effectively carried out by the appointment of an unpaid Library Board with offices in the Government Buildings at Wellington. The Board should have a paid secretary, skilled in library work, and two experienced organizers, on the American plan. The cost of the staff would not be a very serious matter. The distribution of books for school libraries might be made either wholly through the Boards of Education, or partly through the Boards and partly through the agency of the municipal libraries, which could carry out the work at comparatively little increase in the cost of issuing books free from the city libraries. This is a matter which requires careful consideration and inquiry after the Board has been set up to deal with all parliamentary votes for library purposes, and it depends upon the extent to which Parliament is prepared to promote the establishment of adult libraries for settlers in scattered country districts. The two systems might be worked in co-operation with a saving in cost. There should be a saving in the expenditure upon free readers in the schools through the establishment of school libraries which will provide books for use in the various classes. The *School Journal* was established for the purpose of widening the reading in schools. I believe that this object could be secured more effectively by placing good libraries at the disposal of teachers and scholars.

4. *Mr. Wells.*] Have you thought over the difficulty of transit in our country districts?—Yes, that is a matter that requires some arrangement, but there are some American States which have travelling libraries that are quite as scattered and difficult to reach as in New Zealand; and if you come to look at it from the school library point of view that is not a very serious difficulty, because the schools are pretty well dotted all over the place, and these libraries could be exchanged between the schools at comparatively little cost. The book sets in some American schools cost about 8 dollars, and that used in one school can be passed on to another school at comparatively little cost. I do not think the cost should be prohibitive. The estimate made by the Department has taken that factor into account, I presume. That estimate gives the cost of distribution at 1s. per pupil. The Wanganui Board also went into it, and for Wanganui and its vicinity the estimate was 1s. 3d. per pupil. There are about 50,000 pupils in the Fourth Standard and upwards, and that only means a cost of £2,500 a year. It is not such a very extravagant cost.

5. There might be centres throughout the country districts?—Yes, that would be a matter of organization. I think it would be necessary for the central Board to have two organizers. In America they have library organizers who are specially trained for the work. They would arrange to the best advantage for the distribution of these books. The Board would buy these books to very much greater advantage than they can be bought now. At present the grants distributed for books, mainly to public libraries, are spent not to the best advantage. The library committees have great difficulty in getting the best value for their money. They have no facilities for buying books to the best advantage. The money granted by Parliament now—£3,000 or £4,000 a year—is not put to such good advantage as it could be if there was a Board devoting its attention to library work. There are any number of people who give their time to education and other public interests, and I think there would be no difficulty in getting men who would give their time to this special work if proper officers were provided for the executive work.

6. And rebinding also could be done on wholesale lines?—Yes.

7. That is an extensive item in connection with small school libraries?—Yes. There, again, you would get advantages through doing the work on a general system. Your binding would be done more cheaply. Sometimes it is of advantage to substitute a new book rather than bind the old one.

8. The actual selection of the books would be a matter for the central Board?—As I have explained, under the system adopted in America the teacher can make his own selection from catalogues furnished by correspondence, or he can go down to the library and make his selection. But in the main the selection would be made by the officers of the Board. There would be arranged a certain number of well-selected school libraries, varying in the books composing them, so that a school exchanging a No. 1 set for a No. 2 set would get a complete renewal of its library.

9. I would like to know if you have any views on the subject of our Commission generally?—I have certain views on our system of education. I do not know that I can speak as an expert to experts, but I have a good general knowledge of the system. I have been brought in contact with boys and men who have passed through all grades of education.

10. *The Chairman.*] Can you, as a man who is concerned with an establishment which is a large employer of labour, give us an idea as to what the quality of the instruction is as shown by the products of our primary school who pass through your hands?—I can speak from my knowledge. I have established the only reading-room for boys in connection with a public library that is open at night in New Zealand; I have seen a good many boys, and I do still see them constantly. I taught in a ragged school in England when I was twelve years of age; and I have known boys intimately in connection with our own work. I am a member of the Council of the Kindergarten Association, and know the kindergarten work here. I am also a member of the Council of the University. I have no objection to express my opinion on the general results of our system so far as my observation goes. I thought it possible some questions might be asked me, and I set down very briefly my views on the subject. My opinion is that the essentials of a sound primary education are suffering deterioration through the intrusion into the school curriculum of matters which may with advantage be relegated to a later period in the pupil's life. I consider that the work of the six standards should be confined mainly, if not exclusively, to the thorough teaching of reading, writing, arithmetic, grammar and composition, with a good knowledge of English literature, drawing, elementary teaching in natural science, including

astronomy, botany, and geology, the general principles of mechanics, history, and those broad principles of political economy which form the basis of government. If a boy acquires a moderate knowledge of these subjects by the time he reaches the age of twelve or fourteen he will have done very well indeed. For girls I would add sewing and domestic economy. Specialized teaching in technical subjects I would dissever entirely from the primary schools, except in the country districts, where a place should be found for agriculture. I would make our technical colleges continuation schools, largely carrying on their work at night. When a boy leaves school—often after he has only passed the Fourth Standard—he is liable to get completely adrift. Private effort, in the shape of boys' brigades, Y.M.C.A.s, and similar institutions are doing something for him, but it appears to me that there is a defect here which demands the attention of the State. I have grave doubts about the wisdom of the policy under which we are holding out strong inducements to boys, irrespective of ability, to obtain a smattering of secondary education at an age when they would be better employed at the trade by which they are to make their living. The effect, it appears to me, will be to multiply the candidates for employment in the already overcrowded class of clerks, to the injury of the industrial welfare of the country. If you examine the careers of successful men in young countries you will find that, as a rule, an academic education has had little to do with the part they played in the world's affairs, and the general tendency of business men who could afford to send their sons to a university is to put them to work at a comparatively early age, unless they are intended to follow a profession in which some degree of classical attainment is necessary. For these the retention of Latin is at present indispensable, but otherwise the more these schools are modernized by substituting modern languages and scientific and commercial instruction for classics the better, in my opinion, will it be for the true educational interests of the country.

11. *Mr. Wells.*] Would not the programme for the primary school that you have outlined rather tend to extend the work undertaken at the present time than to lessen it?—My feeling is that this manual training should not be introduced at all into the primary-school work.

12. Do you know that the introduction of that manual work has given a distinct bent in the boys towards manual work as against the old inclination to go in for clerkships?—My contention is that boys are not now so well grounded as they were before. I maintain that to make a good mechanic you want a boy to understand English, to be able to write decently, to be a good arithmetician. My conviction is that for whatever profession he is to follow he should be well grounded in the essential elements of primary education, and you cannot do that thoroughly in the few years that the average boy spends at a primary school if you are to add a number of things which may be of very little value to the boy in after-life. It seems to me that there is in the syllabus a number of things which are non-essential, and which might be removed, and that a boy, if he were grounded in what are the absolute essentials of primary education, would be very much better fitted for any calling he may choose to follow. I have met in practical life with men who, life myself, left school before the age of thirteen years, and who were so thoroughly grounded in the essentials of a sound primary education that they were much better fitted for the work of life than the boys I see now. I am amused sometimes at the gross ignorance of boys now on such matters as certainly I would have been familiar with when ten years of age under the old system, and I can only suppose that this is largely due to their attention being diverted from these essentials. My contention is that these subjects to which I have referred are absolutely indispensable to a sound primary education, and that if you do not ground the boys well in these essentials they will never be of any real use as citizens. Unless they carry on their education afterwards they will never be good carpenters, good blacksmiths, or good tradesmen of any sort.

13. Would you make attendance at continuation classes compulsory?—I am inclined to think so. I do not think that pupils should be allowed to leave school after the Fourth Standard unless there is to be further teaching. I see some of these boys who leave school, say, after the Fourth Standard, smoking cigarettes at the street-corner from year's end to year's end. These boys not only do not advance their education, but they go back—they lose what they have acquired. I think that the technical schools should be entirely continuation schools, largely at night; but where they are carried on in the day I think their course should only begin after the boys have passed through the ordinary primary standards.

14. Do you think that employers might be required to allow apprentices time off in the afternoons?—No; I think that would be destructive of any satisfactory system of apprenticeship. I maintain that while technical schools are of use in encouraging boys to take a more intelligent interest in their business, that the real work of teaching trades must always be carried on by the trades. It is impossible that a boy could be taught printing, for example, in a technical school as we would teach him printing in the *Star* office, with all the appliances of the printing trade at hand to teach him. No technical school could be equipped as a business must necessarily be equipped to carry on its trade. For instance, we have to-day two parties coming from the Technical School to look at our printing plant and equipment. If a boy is going to learn the printing business he can learn it in the *Star* office infinitely better than he can learn it in the Technical School. At the same time technical schools are of advantage in mechanical employments by encouraging boys to study the higher principles of the trade or mechanical operation which they could not obtain in the ordinary practice of the business. I have a very strong opinion, formed by my observation of boys, that there is a gap between the time a boy leaves school and the time when he becomes a more or less responsible kind of citizen. Drill may induce some discipline, but after a boy leaves school now he very often deteriorates at a rate that is not at all satisfactory, unless he has the control and guidance of good parents. But there is such a lack of parental control here that I think the State ought to take hold of him after he leaves school.

15. Do you think the public is sufficiently advanced to support attendance being made compulsory at the present time?—I do not think it is; but public opinion perhaps was not sufficiently advanced for military service, but it is being educated to it.

16. *Mr. Poland.*] Do you approve of the local option which is given to different districts in connection with the continuation classes as an introduction to the compulsory system which may be brought in later on?—I certainly approve of it. I think the best means of testing that opinion is by introducing it gradually through the country, and so educating the country.

17. *Mr. Thomson.*] In regard to libraries, do you advocate the abolition of the *School Journal* and the grant of free school-books, and the substitution therefor of school libraries?—I should advocate the abolition of the *School Journal*. I should advocate the substitution of good libraries to be used in place of the *School Journal*. They serve the same purpose, and serve it better. I think the money that is devoted to the *School Journal* might be better applied by giving it still further breadth by providing adequate libraries. I should not like to express an opinion in regard to the free readers—that is rather a question for teachers in contact with the work.

18. Are you aware that 54 per cent. of the boys and 53 per cent. of the girls leave our primary schools without going through Standard VI?—I am not aware of that.

19. You think the difficulty we have to get over is to see that our boys and girls pass through Standard VI at a reasonably early age, so that we may then bring into operation the compulsory law entailing upon them the necessity of attending a continuation school where special vocational instruction could be given?—I think the fact that children leave the schools at this early age must be taken into account. We are faced with the fact that parents remove their children. Why do they remove them? Probably because they require them to enter into employments. Now, there are two courses we can follow. We can either say to parents absolutely, "You shall not withdraw your children until they have passed such-and-such a standard, no matter how old they are," or you can say, "We will allow you to take them away, but you must continue them at a school until they satisfy a certain educational qualification or until they reach a certain age." I think it would be easier to allow them to follow in continuation schools rather than to tie the parents down to keep their children at school until they reach a certain age. With regard to making an earlier start with children, from what I have seen of kindergarten work I think there is need for taking hold of a certain class of children earlier than five years of age. We have a free kindergarten in the Freeman's Bay district here, and it is doing excellent work. It takes little babies practically out of the gutter, and gives them some training which is of value to them, though perhaps not of educational value. It is also accompanied by visits to the houses of the parents. Now, whether that can be done by the State adequately, or whether it should be left to voluntary effort, subsidized by the State, I am not clear.

20. In some districts it is the practice to convey children in Standards V and VI from country schools to a centre, and they spend one day a week receiving instruction in manual training: do you think that should be abolished?—I think so.

21. You would have all that relegated to the secondary and technical and continuation schools?—Yes.

22. But you make an exception in regard to country schools: you think agriculture should be taught in the primary schools?—Rather the principles of agriculture than the practice.

23. With the idea of giving the boys a bias towards the farm, so that in the course of years they will take to farming pursuits?—Yes.

24. *Mr. Davidson.*] What are the non-essential subjects in the present syllabus you would wish to see dropped out?—Of course, it would be a considerable business to take the syllabus, which is a complicated sort of thing, and go through it in detail. Generally, I have laid down here what I consider are the essentials, and outside that in the main I would say are non-essentials.

25. Do you know what time is spent by the boys of Standards V and VI in the large towns at present in learning the subject of woodwork?—I cannot tell you exactly the time—I understand, two hours. But what I say in regard to the time actually occupied in the teaching is this: I think it is of less importance than the disturbance in the removal of the boys from one place to another—the change which excites their mind and distracts their attention.

26. I suppose you admit the great value of correlating, say, geometrical drawing with the teaching of woodwork?—I should not admit that. Drawing is a subject which I should not carry very far in the primary schools, but I think it is a good thing to have map-drawing lessons and map-drawing. I should make map-drawing an important part of the geography work of the school. My experience is that it is only a very small proportion of boys or girls who ever become very efficient in drawing—that is, in freehand drawing.

27. If for the first six months of the year the boys in, say, Standards V and VI spent one half-day per week in learning woodwork correlated with free, mechanical, and geometrical drawing, do you think that would disturb the continuity of work in the school?—I think that half-day is a half-day wasted, largely.

28. *Mr. Hogben.*] Have you ever seen a class of boys who have been at woodwork, and have you had an opportunity of seeing what effect it had on their arithmetic and mensuration?—That is a very abstract kind of question, and it goes really outside the range of evidence I have offered. I explained at the beginning that I would not attempt to give evidence as an educational expert. What I was prepared to give was evidence of the general results of our system so far as I had observed them in boys who have come under my notice.

29. You expressed an opinion about woodwork, and I presumed you had some ground for it and knew of its effect?—I hold this: that the essential subjects that should be taught in the schools are inadequately taught, and that the teaching of woodwork is not an essential of education.

30. You do not recognize any distinction between manual instruction and technical instruction?—I would specialize technical instruction entirely outside primary-school work.

31. You think that woodwork has no function as an educational subject?—I think it should be relegated to a later period, because it interferes with what I regard as the effective teaching of necessary primary subjects.

32. Do you think that elementary economics is a good subject to teach a boy of twelve or fourteen?—I think most decidedly it should be taught for a term to make them acquainted with the principles of good citizenship.

33. Is there not a certain amount of that indicated in the syllabus now?—I do not say there is not.

34. Do you think that the present tendency of the change in secondary education is to make more clerks than there were before?—It is not the change itself: it is the encouragement to a large number of boys to go on and get a smattering of secondary education which is of very little value to them.

35. And is it not a matter of fact that when a clerkship is advertised there are more applicants now in Auckland than there used to be?—As a matter of fact, clerks are the worst paid of any profession, which implies that the supply is in excess of the demand.

36. *The Chairman.*] You favour the raising of the leaving-age: that is to say, that a child must either go on to his Sixth Standard certificate or attend a continuation school till he attains the age of fifteen?—I think a Sixth Standard status should be required, but whether it should be required before a boy leaves school or by going on at a continuation school I think is an open question.

37. You know that in one of the countries you visited recently the compulsory age is fourteen, and that between the ages of ten and fourteen a pupil must decide at what continuation school he will proceed, otherwise he cannot leave the school: do you favour the gradual adoption of that system in New Zealand?—I do. I think the age of fourteen is probably early enough; but if there was an efficient system of continuation schools, perhaps it is not quite so necessary if attendance at the continuation schools were made compulsory.

38. You agree that the gap between the primary and secondary schools should be bridged by means of continuation classes and technical schools?—That is so.

39. And that the continuation schools should be properly graded?—That is so.

40. Do you know if it be a fact that the tuition in typewriting and shorthand in these schools has produced this result: that persons come into the labour-market now whose work in composition and spelling is so deficient that very often employers will not have them at all?—That is what I have contended throughout. I say that the essentials in every calling—good English and spelling and writing—are not taught as they should be taught, and I attribute it to the fact that non-essentials occupy too much time. I think we have as able a body of teachers as you will find in any part of the world, and I think the fault does not lie at the door of the teachers, but at the door of the subjects required by our system of teaching.

41. *Mr. Pirani.*] Does not typewriting teach them to spell? Is it not your experience as a teacher that setting type teaches a boy to spell?—Decidedly; but I maintain that it is not the business of a newspaper to teach boys to spell.

42. *The Chairman.*] You do not think it is the duty of an employer to whom a boy or girl comes with a certificate of proficiency in shorthand and typewriting to have to teach that boy or girl English and spelling?—Decidedly not.

43. Are you in favour of what is known as the "rural post" in the United States?—Yes.

44. Are you aware that it is proposed to inaugurate that system immediately?—I think the rural post will facilitate the circulation of books, but I do not think it will meet the needs covered by travelling libraries.

45. In regard to the difficulties of backblocks settlers, would not the rural post, by travelling from home to home twice a week, bring within the reach of these people a better class of literature?—Decidedly.

46. And therefore should be encouraged?—Certainly.

Frederick Edward Norman Gaudin examined on oath. (No. 20.)

1. *The Chairman.*] You appear here as Chairman of the City School Committee and as representing the city School Committees?—Yes. My purpose in coming before the Commission is to express an opinion as to the present method of selecting teachers by the Committees. For the last two years great dissatisfaction has been expressed by Committeemen at the action of the Auckland Board in altering the system of sending four names to them for selection. The Act of 1877 provides that Committees shall be consulted in regard to the appointment of teachers. In 1878 one name was submitted to the then City School Committee, and the Committee of that time sent forward an emphatic protest to the Board, pointing out that the Committee should be consulted, and four names at least sent to them. Since then up till 1910, over a period of thirty-two years, no interference has been made with the old system of sending forward four names, which shows that the protest made in 1878 was very effective. In 1910 the Auckland Education Board brought about an alteration, and submitted one name only. They appealed to the Attorney-General and got an interpretation of the Act, which gave them the right to send forward one, two, three, or four names. How the submission of one name can be a consultation with a Committee is certainly strange to me. They made a general charge against Committees of log-rolling and wire-pulling, and they practically withdrew all power of selection from the direct representatives of the parents of the children. This state of things has been brought about mainly by the grading-list set up by the different Inspectors, presided over by a Chairman who was not at that time in the employ of the Education Board. In my opinion, that was not a right thing to do. I have not been able to see the grading-list, although I asked to see it. I take it there are lots of teachers on that grading-list who are of equal merit, and in such cases I contend it is the duty of the Auckland Education Board—I do not know what practice is adopted elsewhere—to see that these names of teachers of equal merit are sent to the Committee, and that the power of selection of a teacher should be given to the Committee, rather than be put in the hands of the Inspector as it

is now. No Committee will contend that if a teacher is pre-eminently suitable for a position he should not have it; but on behalf of Committees I urge that this Commission should see that where the choice is to be made from teachers of equal merit the Committee should be consulted in accordance with the spirit and intention of the Act. Although the Attorney-General gave it as his opinion that one name only could be submitted to the Committees, still I am positively certain that was not the intention of the framers of the Act in 1877. As it is, the Committees have been placed in a most invidious position by the Board of Education: they have been belittled on all sides; their powers have been curtailed to such an extent that they now have nothing to do practically but act as overseers of the ladies, who scrub out the schools. That is the position in which the Board has placed the Committees at the present time. I am of opinion that if the Committees are to remain in this position it would be better they should be abolished, and the members of the Board, who are now elected by Committeemen, should be elected by the parents direct, and in that way the parents of the children would have a voice in the selection of teachers. At present members of the Board take up this position: they say that Committeemen are intelligent enough to discriminate the tares from the wheat so far as Board members are concerned, but they are not intelligent enough to say who will be placed in charge of the schools. I have only to add that this feeling is general right throughout the whole of this province. I have been in touch myself with no less than seventy-three Committees, and of this number one only has stated to me that they are satisfied with the present system under which one name is submitted.

2. *Mr. Davidson.*] What special qualifications do you personally possess for the judging of the merits of a teacher?—So far as my own qualifications are concerned, I was for ten years a teacher. I suppose I personally know half the teachers under the Auckland Education Board. I do not wish to place myself, though, before any other Committee; I am speaking on behalf of Committees generally.

3. You know that your case is an exceptional one?—If you think so, yes. I am speaking here on behalf of the largest Committee in the Dominion.

4. How many schools does your Committee control?—Four.

5. You know that every school in most districts has its individual Committee?—Yes.

6. You say that the School Committees are the direct representatives of the parents of the children: how many householders, approximately, were present at the annual meeting of your Committee?—There were 283 people in the hall—roughly, 300.

7. How many householders, approximately, are there in the districts represented by these four schools?—There are 2,500 pupils in the four schools, so you can gather from that the number of parents.

8. Have you heard teachers make any complaint about this new system of appointment of teachers in the Auckland District?—As a rule, so I understand. I have only spoken to a few—some are for and some against.

9. *Mr. Thomson.*] Is it not a fact that the teachers of Auckland approve of the existing system of grading and appointing teachers?—I understand they do. I believe the Headmasters' Association and Teachers' Institute have expressed that opinion.

10. Can you give any reasons why they favour this system which you condemn?—I do not think you understand me. I condemn the Board for not sending forward the names of teachers of equal merit who are on the same line of the grading-list. I say that where teachers are of equal merit the Committee should have the right of selection. A Committee understand the requirements of their particular district. They may want a robust teacher, and the Inspector may send them a sickly one, and there may be three others of equal merit to choose from.

11. *Mr. Kirk.*] Do you know from your personal knowledge that there is general dissatisfaction in regard to the limiting of the powers you have indicated of Committees?—Yes.

12. *Mr. Wells.*] If one name is submitted, does that not give the Committee the right to point out to the Board any serious fault, if they know of one, in the teacher whose name has been submitted?—I dare say it does.

13. Are you aware of the fact that, according to the last report, there were 1,147 teachers under the Auckland Board, and do you think it is possible that any Committee could have any adequate idea of the qualifications and claims of such a large number: must not that be left to the Inspectors?—Most decidedly.

14. Are you aware that this principle has been approved by the general body of the teachers here in Auckland and by each branch of the Institute?—Yes.

15. Do you not think that any system that carries with it the confidence of the teachers must be for the benefit of the work in the schools?—I admit that.

16. *Mr. Pirani.*] I understand you would be satisfied with this: if there was only one teacher on the top of his grade and his name only was submitted to the Committee you would be satisfied?—Most decidedly.

17. But if there are several teachers of equal merit according to the list, then you think they ought to be submitted to the Committee?—That is my contention.

18. As Chairman of the City Schools Committee, if all the information in the possession of the Education Board, including the grading-list, was placed at the disposal, confidentially, of the Chairman of the Committee with the application, and the Chairman was then satisfied as to the suitability of the applicant, do you think that would be sufficient?—That would be sufficient so far as I am concerned.

19. Then your complaint really is not so much against one name being submitted as on the ground that insufficient information about that one person is supplied to the Committee?—That is the case. There may be another teacher of equal merit to the one submitted, and a more suitable man in our opinion.

20. *The Chairman.*] If the Board, having come to a choice of the candidates to be sent to your Committee, gave an undertaking that they would be prepared to hear any objection on the part of the Committee to that selection before finally making it, would that be a consultation within the meaning of the Act in your opinion?—As a rule the Committee have no information to object to. We are told Mr. So-and-so is to be appointed, and that if we have any recommendation to make, to make it.

21. Have not the Inspectors of the Board to take all the responsibility of advising the Board as to the best teacher fitted for the position?—That is so, but you are placing the whole of the responsibility in the hands of the Inspectors.

22. Do the Boards, in exercising their legislative authority, always accept the *ipse dixit* of the Inspectors?—They generally put it this way: "In the opinion of the Inspector this candidate is the most suitable for the position."

23. Not "in the opinion of the Board," but "in the opinion of the Inspector"—is that what you tell the Commission?—That is the case. The Inspectors are the gentlemen who appoint.

24. Do you favour the Board system?—I am quite in sympathy with it.

25. Do you approve of the suggestion made that in future the election of Committees and Boards should be on the parliamentary roll?—I am quite in favour of that.

26. I understand there is a considerable deficiency in the playgrounds in this district?—Yes, it is a serious difficulty.

27. Can it be met under present conditions?—Well, the Auckland Board is trying to purchase a piece of ground at Napier Street with the idea of enlarging the playground of that school.

28. How are they going to get the money?—I cannot tell you.

29. Would you favour either a local rate being applied or the city rates in general being applied to assist?—Certainly not. That is a matter for the Government to attend to.

30. You do not think it practicable or desirable that, in order to cope with this difficulty, there should be joint consideration so far as ways and means are concerned—the Government on the one hand and the local education authority on the other, and the City Council supplementing it?—I do not think it would ever work out.

EDWARD WILLIAM PAYTON examined on oath. (No. 21.)

1. *The Chairman.*] What is your position and what are your educational qualifications?—I am Director of the Elam School of Art. I have been in charge of that institution for twenty-two years. I hold an art master's certificate from the Royal College of Art, Kensington. I have been three times medallist and twice Queen's Prize man in the National Art Competitions. I have been teaching art for about twenty-five years.

2. On what subjects do you propose to address us?—I have been asked to give evidence on several points, some of which refer to art education as a whole, and some to art education in Auckland more especially. First I wish to refer to the changes that have taken place in the examination of what used to be called the Science and Art Department, South Kensington, but more recently the Board of Education, London. We have received information that the examinations are to be very much altered. Formerly there were two grades of examinations, both of which have been held in the Dominion for many years. One of them seemed to be just about the standard for the average student likely to be educated in New Zealand; the other was a much higher one, within the reach of any student in the Dominion, but after much greater study. Both these examinations are either to be done away with or merged into one, and that one would be practically unattainable to the average New Zealand student. It entails a five or six years' course of study, which is more than the average student here could give, considering the comparatively small earnings that are at the end of it in the case of the successful student. There is, however, a real want of an examination which would be sufficient for New Zealand requirements, and I beg to suggest that the Education Department of the Dominion should take the matter in hand and conduct the examinations that have hitherto been held here under their supervision, the results having been sent to London. So far as one can see, these examinations could be conducted by art masters belonging to this country, or it would be easy to import art masters who could conduct examinations which would be as good to people in the Dominion as any held at Home. One grave defect in the former examination, from the point of view of the students here, was that they had a very long time to wait between the time of the examination and the declaration of the result. Frequently we had to wait six months before we obtained any of the results from London. The average student was often deterred from entering for the examinations on that account. Were the examinations held in the Dominion I am certain that the number of entrants would be very much greater than heretofore. It may be suggested that there would be considerable expense attached to this proposal, but I think the present arrangement is costing the Education Department a considerable amount of money, the examinations here having to be held under their supervision, and other expenses having to be met in London for the actual examination of the work. Probably there would not be much difference in actual cost between the examinations held in London and examinations such as I am suggesting. There would be a very great incentive to students to proceed further with art-work if some such examinations were instituted. Another gain would arise from the increased interest that would be taken in the matter by art students—the competition it would involve. Without emulation it is almost impossible to produce good work. The more emulation there is, within reasonable lines, the better for everybody, and competitions are exceedingly useful on that account. The chief competition in the British Islands and British overseas Dominions has hitherto been the National Art Competition, held once a year, in which all the best works of the various schools are sent up to compete one against the other, and awards are made in the shape of medals and prizes of various kinds, to which the students attach a good deal of importance. Out here we have very

little chance of competing successfully with the schools at Home. Some of our schools have been competing for many years, and, with the exception of a solitary bronze medal and one or two book prizes, New Zealand has not so far got very much out of the large number of medals and other prizes awarded. The reason is not far to seek. The difficulties to be contended with here are naturally very great compared with those at Home. Certain other subjects in which the examinations are held are practically impossible here—historic art or historic ornament, for example. There is very little chance of producing work of that kind here, except from books, and that is not altogether satisfactory. Even in the Old Country, when I was a student at the Royal College of Art, I have known students to come from Liverpool, Manchester, and Glasgow especially to study at Kensington for historical ornament. I only mention that as one example. I suggest that if it is possible to hold Dominion competitions they need not be held annually, but, for a start, biennially or triennially, between the schools of art, and that every one should have a chance of competing. If the best works do not come up to a certain standard the prizes might be withheld. The awards would need to be made by some one entirely outside the Dominion, but it should not be necessary to go further than Australia. I am sure that this would give a very great incentive to art education in the Dominion. The gaining of a prize in the National Art Competition is naturally a greater thing than such a Dominion competition, but nineteen out of twenty of the students go into that competition under the impression that they stand no chance of getting the prizes that are awarded at Home, and I think they are right to a great extent. They have very little chance compared with the student working under better conditions in the Old Country. I think a Dominion competition would produce a large number of competitors, and would have a very beneficial effect on art education. There are quite a number of art schools that could compete, and I think the number of competitors would be very large, whereas the number who go in for the National Art Competition is very small indeed. If anything of the kind is done, I suggest that the best works produced during the year should be purchased. I am sure they could be purchased for a nominal sum by the Education Department for distribution to the country schools. There are a very large number of schools that have very little chance of comparing their own work in a subject such as this with the work of a larger school, and it would benefit them if a selection of the work sent for competition could be sent to them from time to time. It may be suggested that the works which are now occasionally purchased by the Education Department from the Old Country answer the purpose, but I do not think they do altogether. Many of the works sent out are admirable for the purpose. Many of them, however, deal with subjects a little beyond that, such as historic ornament and historic art generally. If a simpler set of works were sent to the country schools it would produce a much greater desire for art-work than at present. Speaking as one who has had a great deal to do with the country as well as the town, I may say that I find no want of ability in the country. The demand is there, but the opportunity for satisfying it is not there. That demand should be fostered, and both the demands I have made would work in that direction. The Elam School has been in existence for about twenty-two years. It was started under a bequest from the late Dr. Elam principally for those who were unable to pay for tuition—not entirely for them, but principally. It continued as a day school for six or seven years, and a year or two after the Manual and Technical Instruction Act came into operation I obtained recognition for the school. I think it was one of the first associated schools that obtained recognition. After working for a little time with the Department it was suggested that as public money was being used it should not be confined to one class of student, but that every class should have access to the school. The suggestion was made that fees might be charged, and the school would then be within the reach of every one. The Managers complied with the request, and the school then became what it is now—the Elam School of Art and Design and Auckland Art School. For some fifteen years we have been working under the Education Department, and for thirteen or fourteen years we have been under the direct inspection of its Inspectors. The question to which I am working up is this: We have before long to make arrangements for new premises. The Managers are quite prepared to build a suitable school, and to equip it thoroughly in such a way as an Auckland School of Art should be equipped. But there is a considerable amount of overlapping in some of the subjects going on in Auckland, and the Managers do not altogether like to commit themselves to the complete school without knowing whether or not that overlapping is to continue. If the overlapping should be discontinued it would probably mean that greater provision will be made by us for students in the building we are contemplating. The necessity for overlapping seems to me very doubtful. In a place like Auckland, though the number of students is perhaps as great as in any centre in the Dominion, it does not amount to a great number, and it seems to me a pity that there should be any overlapping. I do not propose to enter into the exact subject on which overlapping is taking place, but merely to mention it casually. About two years ago classes were started in higher art at the Technical School, which up to that time had not been attempted. Life classes—classes in the highest kind of drawing and painting from life—were started at the Technical School, and continued for some time. Our Managers communicated with the Education Department, calling attention to the fact that under the original arrangement between the two schools there should be practically no overlapping between them. In course of time we received an intimation from the Department that they had looked into the requirements of art in Auckland and the instruction given at the Elam School of Art and Auckland Art School, and they were of the opinion that everything was provided for students that was necessary, and consequently they had notified the Education Board that they would withdraw the departmental support from the Technical School classes. So far that was satisfactory. But overlapping is going on now in other subjects —in more elementary art. The necessity for it is not easy to see. The school of which I have charge is quite prepared to meet any demand that may be made upon it in Auckland either now or in ten years' time. It can easily meet any requirements that are likely to arise. We have

from three hundred and fifty to four hundred students on our books, but before long when the accommodation increases, that number will increase. Some time ago the Education Board brought from Home two gentlemen to act as art teachers. It was suggested at the time—I am not sure by whom—that their appointment was intended to do away with the difficulties the country teachers will find in dealing with art education. We understood that the bulk of their time would be given to instructing the country teachers, and that occasionally they would teach in the large country schools. I understand, however, that they have been working mostly in the town, and rather in the direction of creating another art school in Auckland, for which there does not seem to be any necessity. No one would welcome the advent of further qualified teachers more than myself, but if they are simply duplicating the existing classes the necessity for their work is not obvious. If their work was conducted in the country, and had more to do with the country teachers and the conduct of country schools, there is not the slightest doubt that they would fulfil a demand which is very great indeed. Mentioning the Technical School as duplicating some of our classes leads one to consider the question whether art should be taught at the Technical School, or at the Art School, or at both. I do not propose to go into the question further than to say that I have a large number of statistics in my office bearing upon it, and they all show plainly that the modern tendency at Home—and I think the same tendency is found in these colonies—is to separate art and technical work as much as possible. In every case where they have been carried on in the same building art has been starved. To show the tendency in the Old Country, I have particulars of some 328 art schools in the British Islands, of which only forty-eight are carried on in connection with technical schools. I think that of itself should be sufficient; and the forty-eight places are generally so small that the reason for the combination of the two systems is obvious. It is a question of expense, whereas many of the larger art schools have only in comparatively recent years separated themselves from other institutions. The building that we wish to put up is to be, if matters can be arranged satisfactorily, a thoroughly up-to-date school of art. I do not know that there is an up-to-date art school in the Dominion at the present time. All the existing schools have been built a certain number of years, and one does not go many years nowadays without improvements being required. Some of them are very well suited for the work they have carried on up to the present time, but there are always improvements to be made. We hope to make those improvements, and the question that we wish to lay before the Commission is whether it is desirable for two schools to be competing with one another.

3. *Mr. Pirani.*] How is the controlling body of your institution elected or appointed?—It is appointed early in each year. The Board of Trustees were the original Managers, but they now delegate their authority to a Board of Managers. These Managers have to be elected every year, and their names submitted to the Government for approval or disapproval.

4. Would there be any possibility of an arrangement being made between your Board and the Board of Education to prevent overlapping?—I could not tell you.

5. Would it be advisable for the two bodies to meet and discuss the point?—I think it would be distinctly advisable.

6. Would it be possible at your institution for a student to get his art master's certificate?—Under the old regulations it was quite possible, but under the new regulations to which I have referred I doubt whether it would be possible in New Zealand—at any rate, within the period that they state, five or six years.

7. *Mr. Wells.*] Are we to understand that there is no overlapping, from your point of view, in the department of the higher art?—There is in the highest class, such as the life class.

8. Has the life work been undertaken by the Elam School all along?—Yes.

9. Are you acquainted with the work that is being done in the schools by the teachers under the Board?—Not entirely, but I am acquainted with some of it.

10. Was that work ever attempted by the Elam School of Art?—No, nor has the school ever wished to do it.

11. Then you are not complaining about that?—Certainly not. That seems to be the proper function of the teachers under the Board.

12. But is not that how their time is principally spent?—I cannot say how much time is given to it, but in the advertisement students are asked to come for an art course at the Technical School.

13. The greater part of the time of the art teachers employed by the Education Board is spent in going from school to school, putting in an hour or two in this or that school, and advising the headmasters and teachers. Do you insinuate that there is any possible overlapping there?—No. We do not wish to touch that.

14. The rest of their time is mainly taken up in instructing the young teachers. Do you mean that that might be done at the Elam School?—We did it until the Technical School was started. We had all the teachers at that time. There would not be the slightest difficulty in taking all the teachers again. That is not the work I am referring to. But there is no necessity for duplication. We are in a position to teach the teachers as well as the Technical School is.

15. With the art instructors going round from school to school, would not they have special knowledge of the direction in which help is wanted?—Possibly.

16. In that respect would not their training of teachers be especially valuable?—Yes. At the same time, we have a considerable number of teachers at the present time attending our school.

17. Would the Elam School of Art be prepared to undertake the instruction of all teachers in the elementary art required?—Certainly, and it is quite capable of doing it. I have had as many as two hundred teachers on my books in one year. Of course, when the Technical School started, the teachers were withdrawn.

18. Did the Elam School ever attempt to cater for the teachers in the country districts, who can come in only on Saturdays?—We encouraged them to come as often as possible. In attending our schools they have a right to the reduced rates on the railway.

19. Are your classes held at such times as to suit them?—Yes. They are held practically all day on Saturdays. In fact, I may say that our school is never closed any day, except on one morning for cleaning.

20. *Mr. Kirk.*] Is the tendency towards overlapping as between your school and the Technical School increasing as far as the Technical School is concerned?—I mentioned that the life classes had been discontinued owing to the suggestion of the Department, but within the last few weeks they have been restarted.

21. Why has that been done? Has the Department given its sanction?—I do not know, but they have been restarted.

22. Do you view that with apprehension?—I do. The withdrawal of the Department's recognition will no doubt affect it, but it is a pity that there should be the slightest opposition in a place like this. Auckland is not a large place, and the number of students for this kind of work is not great, and I think one good school is better than two or three small ones.

23. Did you have a promise that there should be no overlapping within five miles?—I do not know that there was a definite promise, but there was a suggestion to that effect.

24. There has been that understanding?—There has been that understanding always, as far as I know. I have over and over again refused students for such subjects as building-construction, which is more on the science side.

25. You think it would be against the best interests of art instruction that there should be in this city work going on in your own school and the Technical School on similar lines?—I certainly think so.

26. *Mr. Thomson.*] Who is the Inspector to the Elam School under the Education Department?—Mr. Isaac has done most of the inspection.

27. Is he qualified to inspect in matters of art?—I am not acquainted with his qualifications, but I assume so, as he is appointed by the Department to do it. I fancy his work is so great in other directions that it would be impossible for him to be a thorough expert in everything. He can hardly be considered an expert in cooking and engineering classes and all the classes combined, but that he has a good general knowledge of them all I have no doubt. I should certainly say in regard to his art-work that the experience he has had in the other schools of the Dominion has been of great advantage to us. He has an advantage over any other art teacher, however well qualified.

28. His inspection-work is good?—It has been thoroughly satisfactory as far as I am concerned.

29. What was the resolution passed last year at the conference called by the Auckland Education Board to consider the question of overlapping?—That there had been overlapping.

30. The record says that a motion moved by Mr. Garland was carried to the effect that "as there appeared to be no overlapping between the Elam School of Art and the Technical College, the conference would not further consider the matter"?—That referred to the then state of things. The overlapping had been stopped.

31. I understand from the record that there had been no overlapping between the two schools?—I could not say that that would be correct.

32. What alterations have been made in the Technical School syllabus with regard to art since last year?—I could not say. If Mr. Garland is reported as saying that there was no overlapping, that might be incorrect at that time.

33. An amendment was moved by Mr. George in favour of a special inquiry into the work of the Elam School of Art and of the art department of the Technical College, and of a report as to the work which should be carried on at each of these institutions. This amendment having been lost, Mr. Garland's motion was put and carried. Consequently it seems that there was no overlapping such as you say exists?—The whole matter was not gone into; I do not think the whole matter occupied more than a quarter of an hour.

34. Do you think the whole work of teaching art should be taken out of the technical schools and confined absolutely to the Elam School of Art?—It should certainly be confined to one institution.

35. Would economy be effected by doing so?—Certainly.

36. So far as having one Board of control for all educational matters in the education district, do you think the Elam School of Art should be under the control of the Auckland Education Board?—I do not think that would be possible, because under the trust the trustees have to be represented.

37. Could they not appoint the Education Board as Managers?—I suppose that would be possible.

38. Therefore there is no reason why that institution should not be brought under the central provincial authority?—Not that I am aware of, provided that the terms of the trust are respected.

39. *Mr. Davidson.*] Do you think that a Dominion art examination such as you suggest is quite practicable?—Quite, I think. I have gone into the matter and thought it out. In fact, I mentioned the matter to the Department six or seven years ago.

40. Do you not think that the standard of work would be lowered?—I do not think so at all. It would create a much greater interest in art. I do not think the standard need be lowered, as we could still get work out from Home, and pass it round as examples.

41. Do you think that certificates and medals awarded under such an examination would be considered as valuable and held in as high esteem as those hitherto obtained?—They would not in any other place but in the Dominion. Within the Dominion I do not see why they should not.

42. I find that the Department spends something like £650 a year on the examinations at present. Do you think that if that amount were spent in the way you suggest it would be suffi-

cient?—I think it would be quite sufficient. It is a matter which requires a little thinking out, but it seems to me probable that even one examiner would not be required to put in his whole time at it, and the travelling-expenses would not be very great. The services of an examiner could be secured for, say, £300 a year.

[*Mr. Hogben* here stated that the £650 covered the City and Guilds of London Examination as well as the South Kensington Examination.]

43. Would you suggest about the amount you consider necessary for the conducting of the art examinations in New Zealand?—That would be a little difficult on the spur of the moment. The Inspector-General should be able to say more as to the expenses of the examinations, because examinations would have to be held in many centres. The cost of the examiner himself would scarcely be half the sum you have mentioned.

44. You suggest the purchase of specimens of the students' best work. Would you carry that suggestion further and recommend the Education Boards to send the best of the work from the primary schools—for example, in freehand and brush drawing—to the schools in outlying districts, so that teachers could get an idea of the standard of work done in the best schools?—I think that would be an admirable idea.

45. *Mr. Hogben.*] You think that all the art classes should be connected with one school?—I do think so.

46. You refer to the classes in pure art—art that has no immediate relations to the arts and crafts?—I would suggest that pure art and arts and crafts be taken together. I see no difficulty about that. For instance, at the present time we have various classes in craft work, and we make no distinction between them and the art classes.

47. Would you separate designing that is connected with the crafts from the crafts themselves?—I think not. They would both come in what I call the art course.

48. Suppose it was a question of the designing of ironwork: would you do the iron-moulding in the Art School?—That would be impossible—iron-moulding is scarcely a "craft."

49. Would you teach the designing of ironwork in one school and the moulding and casting in another?—That would have to be done.

50. Is not that as much of a divorce as if you divorced the two kinds of art?—I think not.

51. As to the making of carved furniture: would you have the wood-carving in the Art School?—Yes.

52. Where would you have the furniture-making?—I do not look upon furniture-making as a craft subject; it is a trade subject.

53. What about art furniture?—I would call the decoration of it an art subject, and the actual making of the furniture as a trade subject.

54. Is that the practice in other parts of the world?—Yes.

55. Do you know any school of arts and crafts in England?—Yes, the Birmingham School, for instance.

56. Do they not work the art with the actual making of the things?—Not in the sense of making furniture. The two subjects seem to me entirely separate.

57. Have you read about what is done at Jena, Dresden, and Leipsic?—I have. I believe they do separate the arts and trade subjects there. There are separate schools for the carrying-out of the works. I know they do that at Vienna.

58. Do you see any harm in one authority exercising general control over art schools and technical schools, so that it could define their courses?—I see no objection to it.

59. *The Chairman.*] Do you see any objection to the principle of co-option being adopted here in this connection?—None at all.

60. If it is represented to the Department by the governing body of a recognized school that there is overlapping on the part of another school within five miles, would there not be a departmental inquiry, as a matter of course, to see if the allegation is well founded, and if it is proved well founded would not the Department intervene?—It seems to me that that ought to be so. When the Department withdrew their recognition in the case of the higher art schools we thought that overlapping generally would cease, but it has not. Such work as the more elementary work, work from the antique, and work from the cast is being duplicated.

61. Your contention is that your school can teach such art as they require to all the public-school teachers, and should not be interfered with?—That is my opinion.

George George examined on oath. (No. 22.)

1. *The Chairman.*] What is your position?—I am Director of Technical Education and Manual Training for the Auckland Education District.

2. What has been your own educational course, and what are your qualifications?—I entered the Merchant Venturers' Technical College, Bristol, in 1889. I received instruction there until 1896, when I joined the staff, taking chiefly elementary mathematics. I continued my studies at the College and also at the University College in Bristol. My academic qualifications include the Associateship of the Merchant Venturers' College, the Fellowship of the Institute of Chemistry, the Fellowship of the Chemical Society, and the Membership of the Royal Sanitary Institute. In addition I hold something like sixty certificates of the Science and Art Department, South Kensington, London. From 1896 to 1899 I was science master at Allan Glen's School, the Boys' School of the Glasgow and West of Scotland Technical College, and I also taught special classes in chemistry under the Lanarkshire County Council at the Hamilton Academy. From 1899 to 1902 I was headmaster of the Sutherland Technical Institute, Longton, Staffs. In 1902 I came to New Zealand as Director of the Auckland Technical School. Soon after I arrived here the Education Board considered that it was necessary that all the work in the province should be brought under my direction. Accordingly I was appointed Director of Technical Education and Manual Training for the Education District. This appointment I hold at the present time.

3. What matters do you desire to lay before the Committee?—At the outset I should like to say that I have always taken Spencer's definition of education as one which should guide us in dealing with all educational matters. He said that "to prepare us for complete living is the function which education has to perform." Therefore my remarks with regard to education in its various branches will deal particularly with education on those lines. In connection with the administration of the Central Department I would like to say that this is a branch with which I come into contact through the administration of manual training and technical education. From that standpoint it appears to me that the administration of the Central Department is weak, largely on account of the insufficiency of the expert staff, and because the experts that are engaged are not sufficiently well paid to secure the quality of expert advice that we should have. Some twelve months ago Sir Joseph Ward publicly stated that the officials in New Zealand were probably the poorest paid in the British Empire. I think that applies particularly to education. The result is that we do not get the same efficiency that we might expect if we employed more expensive experts. Take particularly the matter of the introduction of manual training and technical education into New Zealand, which practically started with the passing of the Manual and Technical Instruction Act of 1902—the year when I came to New Zealand. It might have been thought that one of the first things to be done in connection with that matter would have been to appoint experts to deal with technical instruction and manual training. But the only appointments made at that time were those of two Inspectors, neither of whom was qualified to deal with technical education—that is to say, neither of them had had any real experience that would be of value. I take it that if the country was willing to pay in a matter of that kind the proper course would have been to get really good men, in which case we should have seen very valuable results. Particularly in the smaller towns, where expert Directors were not available, the help and advice of such men would have been very valuable indeed, if they could have spoken with authority and from experience. As one of the results of the administration, we have had an annoying amount of red-tape introduced into the manual and technical work in New Zealand. Take, for example, the subjects which are now requisite as part and parcel of the primary-school curriculum —subjects such as brushwork. The amount of clerical work that is entailed in connection with these branches of elementary education is enormous, and altogether unnecessary. Greater efficiency could be obtained if the money were spent in other directions rather than in clerical work. If you require classes in brushwork to be recognized in a primary school the teacher has to fill up a form indicating his desire to take the subject. Then the form has to be made in duplicate and sent to the Board, and the Board has to send it to the Department. When the Department recognizes the class, notice has to be sent to the school, and at the end of it all there is a capitation payment of 9d., say, in the primer classes paid on account of this work. That is just an example of the kind of thing we have to submit to. I am not speaking in any carping spirit, but I am giving my experience in the hope of getting many of these things altered, and so bringing about the increase of efficiency. Again, take the payments in connection with technical classes. Many points in our system have been copied from other countries, but copied without due consideration for the difference in the requirements. For instance, there has been recently introduced a graded payment on account of technical classes here for the first, second, and third years, and these classes are differentiated into commercial classes, domestic science classes, hand-work classes, and so on. The rates of payment have differed in each branch for each year. In making out the returns there is a tremendous amount of extra clerical work. This system was copied from the Home requirements, but no consideration was given to the fact that at Home these graded payments were made because it was considered that some of the subjects were more expensive to run in the Old Country than others, because the local authority has to find the apparatus, whereas here the Government is supposed to find the money for equipment and apparatus; and, therefore, when once you have established classes it does not cost more to run one branch than the other. These are examples where I think we might have had greater efficiency if the Inspector-General had had associated with him men who had had experience in this branch of education elsewhere. Dealing with the subjects that come under clauses 3, 4, 5, 6, and 7 of the order of reference, I am very strongly of opinion that the Dominion should be divided into suitable education districts, and in each district there should be one authority—the Board of Education specially elected by the people, with power given to the Board to co-opt as well. There are always men who will not come out to be elected by the popular vote, but who will give their services if requested. This Board, I consider, should be charged with the control of all the education in its district—not only primary, secondary, and technical, but also university education. If that were done we should avoid a good deal of overlapping. This Board, I think, should be compelled to levy rates for education, and these rates should be subsidized by the Government at the rate of £2 for every £1 raised. The Government should still pay the salaries according to a Dominion scale, and this Dominion scale should apply not only to primary, but also to secondary, technical, and university education. The Boards, I think, should have the power to increase the salary above the Dominion scale. The Dominion scale should be looked upon as a minimum, because what is required in order to produce the most efficient education system is to have healthy emulation between districts. Why should not any particular district say, "We are going to have the best education district in New Zealand, and we are going to attract the best teachers to it. We will put our hands in our pockets and pay salaries over and above the Dominion scale"? It seems to me, after ten years' residence in New Zealand, that there is too great a tendency to bring things down to a dead level. I would like to see a tendency to bring things up to a higher grade. There is no reason why any institution, or any number of institutions together, should not have a separate local Committee working under the Board. Such a system as this would abolish probably one of the most unsatisfactory features of the present system—payment on average attendance, and payment by capitation in connection with hand-work classes. In order to see that the work was was properly carried out, Inspectors—or you might call them advisers—should be appointed by the

Central Department, and the Central Department itself should be under the control of a Council of Education. Having established our authority, the first thing we have to see to is that our teachers are properly trained. All teachers, whether primary, secondary, technical, or university, should be trained. The present system is unsatisfactory, in that insufficient time is given to the technical training of the teachers. The teachers when they enter the training college should have practically completed their academic training, with the exception perhaps of training in such special subjects as agriculture and drawing. The age at which they enter the training college should, I think, be raised. They should not be allowed to enter until about the age of twenty. This would mean that they would have received a good academic training by that time. Then, the male teachers should be bound for a longer term than at present. Many male teachers who enter the training college use it merely as a stepping-stone to get into the law or some other profession. They should be bound to the teaching profession for ten years, and be required to refund the cost of their training *pro rata* for every year for which they released themselves. The female teachers, I think, should not be compelled to do as hard work as the male teachers, and their pay should be regulated accordingly. A woman is not naturally constituted to stand the hard strain that teaching entails. In the primary schools generally, compared with other countries, there is not sufficient money spent on buildings. There is not sufficient attention paid to hygiene, in such matters as heating and ventilation, for instance. In connection with every primary school there should, I think, be a kindergarten. Pupils should also be required to attend until they reach the age of fifteen. Every primary school in the Dominion should be provided with a school-garden for experimental purposes. In the towns, portions of the parks and domains could be used. This, I think, is one of the most important branches of the work that can be done in the primary schools. I do not agree that the school-garden is useless, as I understand has been stated by some of the witnesses. I know from actual evidence that very great advantage has accrued to a district through the experimental work that has been carried on in its school-garden. We do not make much attempt to see that our children are properly medically examined. I think that every school and every child should be examined at least twice a year. One of the greatest bugbears in connection with the primary system is the number of very small schools. Many of them are absolutely necessary, but in certain districts they should be consolidated into one central school. I look upon the consolidation of the smaller schools as one of the crying necessities of New Zealand. If we had a large consolidated school instead of a number of little ones we could have as part of that consolidated school efficient manual training. We would be able to have also proper domestic-science teaching and efficient agricultural instruction. Wherever possible in connection with the primary schools there should be a swimming-bath. Swimming I look upon as a very essential subject of instruction in schools, especially in a country like New Zealand where there is so much intercourse in and around the country by waterways. Dealing more particularly with the training of girls, we have largely lost sight of the fact that the natural function of every girl is to become a wife and mother. Her education should be largely upon the lines that are calculated to bring that about in the most efficient ways. Whatever else a girl is to be, that is what most girls eventually reach. We want to alter our curriculum, taking away many of the subjects that are taught to girls, and introducing much more domestic work. Again, I think we might try with a very great advantage what has been done in Germany and London—an open-air school system, especially for children who are abnormal and mentally defective. As far as the secondary schools are concerned, these should be more vocational than at present. They should be of different types, to supply the requirements of the particular town. In every secondary school I would make agriculture one of the sides. I consider that it is absolutely essential that all girls should receive special training in home-craft, or domestic work, whichever you like to call it. It has been found from experience that a very large number of children, both in New Zealand and other parts of the world, and particularly in America, have left school before they were fourteen years of age, largely because they got out of sympathy with the work of the school. I think that in America something like 25 per cent. on the average leave school before they are fourteen. This means that they are out of sympathy with the course of instruction. Vocational schools have been introduced during the last few years in many of the States of America, and also in London and other places, and I understand that as a consequence there has been a much greater tendency for the pupils without literary taste to stay for longer periods. Dealing particularly with the technical schools of New Zealand, I suggest that these school buildings in the larger towns could be made to serve many purposes. For instance, the institution could be utilized as a day secondary school, a vocational school, a continuation school, and also as part of the University, as is done in cities like Belfast and Bristol. The day secondary school, of course, would be a modern secondary school, but a certain amount of time would be devoted to manual training for the boys, including metal-work and woodwork, and for the girls domestic work. The advantage of making use of the technical school for these different purposes would be that the same equipment would serve all branches, and the same staff could be utilized for the various purposes. Then, the day technical school would be a school to which students would come for technical work, and from the more elementary portion up to the very advanced work, the most advanced work, such as engineering, for instance, being part of the University. Thus the school could dovetail in, and that would prevent overlapping. The vocational school would be a school where boys, more particularly, would receive a certain amount of training in connection with the various trades. It has been found from experience that many boys who are looked upon as duffers by their teachers because they have not great literary ability yet turn out to be excellent workmen. Very often if these boys were drafted from the primary schools into a vocational school they would become excellent citizens and excellent craftsmen. Even now they stay at the primary schools till the age-limit comes, take little interest in their work, and are a bugbear to the teachers because they do not progress along the ordinary lines of the curriculum, and when they leave they become errand-boys

and drift into the class of unskilled labour. We could do a great deal to eliminate that by differentiating in the later stages of the primary course, finding out what they would be likely to take up, and putting them into the vocational schools, which would give them a direction along the line of their bent. I am very strongly of opinion that it should be compulsory for all boys and girls to attend continuation schools until they are eighteen years of age. I do not at all approve of evening class work. I should like to see the system adopted here which has been adopted at Munich. Munich at the present time has the most advanced educational system in the world. I had the pleasure of spending some time there in 1908, and I must say it has always remained with me as an ideal that I should like to see followed in New Zealand. All the boys and girls there attend continuation classes for from six to nine hours a week during the daytime until they are eighteen years of age. When this system was introduced—I believe it was in 1905—there was great opposition on the part of the employers; but eventually the thing was given a trial, and when I was there every one was delighted with it; the employers thought it one of the best things ever done for the city. Every trade and every occupation is catered for. Even a trade like chimney-sweeping was put on a scientific basis. Its curriculum included, for instance, the repairing of brushes, and dealt with the construction of flues and cognate matters. It is quite wrong, to my mind, to compel boys and girls to attend evening classes after they have perhaps worked seven or eight hours in the day. In the trades they have to work very hard. I know that the boys here work very much harder than in the Old Country—possibly because the master is compelled to pay a definite wage. At any rate, I know from my varied experience that apprentices here are expected to do much more than apprentices are at Home. Many of them come to the classes dead-tired. On this point I would like to relate to the Commission what happened in Auckland about eighteen months ago. There was to be a new award in the plumbing trade in Auckland, and the masters and men were meeting together preparatory to going to the Conciliation Council to settle the terms of the next award. For some time I had been trying to get the masters to allow their apprentices to attend for two half-days a week at the Technical College. At the beginning they were very much opposed to it, and I thought there was no chance of their agreeing to it. However, after many interviews, and after going before the Conciliation Commissioner, they all agreed, both union and employers, that the apprentices to the plumbing trade in the Auckland District for the first four years of their apprenticeship should attend at the Technical College for two half-days per week. Naturally I thought this was a very fine thing, and expected it to be ratified before the Arbitration Court. However, the Judge threw it out, stating that he had no more power to enforce it than to compel the apprentices to attend Sunday school. As an instance of the effect of compulsory attendance at technical classes I would like to instance the Auckland plumbers, who are practically compelled to attend the Technical College, but not in the daytime. Every man who is apprenticed in Auckland has to produce the diploma of the Technical College before he can get a license to do sanitary plumbing. It takes an average student five years to get that diploma. The result of that is that during the past four or five years plumbing in Auckland has reached to such a pitch that we have competed with the Home institutions in the City and Guilds of London examinations, and the Auckland Technical College has done better for the past three years than any of the Home institutions in that examination. I instance that because I consider that there are many other trades here in which it would be of the greatest value to make it compulsory for the student to attend technical classes—in the daytime, of course. I may say from my experience in Scotland and England and also in New Zealand that there is not as much incentive here for apprentices to attend the technical college and technical classes as there is at Home, because of the dead-level of the arbitration awards. The tendency at Home is for a man to get better paid as soon as he becomes better qualified. There is not that tendency here. If you investigate the matter you will find that when an award is made for, say, carpentering or cabinetmaking, almost all the men get the same wage. Even the foremen get very little more than the others. I have urged the employers that they should differentiate—give a half-crown or so more per week to the men who were worth it—knowing that if they admitted that a man was worth a half-crown more he would really be worth 5s. more. But the argument against it is "If we do that it becomes the minimum at the next award," so there has been great difficulty in getting that brought about. With regard to the technical schools themselves, New Zealand has not up to the present realized the importance of having really well-built and well-equipped technical schools. The majority of the institutions have been, until the last year or two, more or less of a makeshift character, and unless we are going to lag sadly behind in connection with technical education there must be a great deal more money spent here in providing buildings and equipment. We have gone very far in the direction of free technical education, but we have put the cart before the horse. We have provided free education, and have not provided the buildings and equipment for efficiently carrying it out. With reference to the teachers themselves in technical schools, at the present time they are under great disability, because they have to be paid out of the capitation that is earned. I consider that of all the teachers in New Zealand the technical instructors should be the best paid, for this reason: if you want a man who is teaching a trade subject to teach it well he must have had a thoroughly good experience in that trade. We know that in New Zealand at present, after the wave of prosperity we have had, there are excellent opportunities for men in trades, particularly on their own account. If we want to get the very best teachers we must make it worth while for them to give up the prospects of earning more than a mere pittance at the trade, and give them really good salaries. If we do not do that we will have to content ourselves with mediocre men. With reference to technical education generally, we are in a peculiar position in New Zealand, in this way: that we are not a manufacturing country, and I do not think we ever shall be, unless the state of affairs becomes even more artificial than it is at present. But we always shall have the domestic trades in this country. By these I mean the building trade, plumbing, and painting, and carpentering, and so on; a certain amount of engineering, particularly perhaps in the near future with reference to electrical engineering and civil engineering, and a certain amount of

repair-work in connection with mechanical engineering. In all these branches we should equip our students well. Then, in connection with all these particulars we shall be well equipped, we shall be able to show the students the most up-to-date methods, and we shall have the best teachers available. May I say in passing that one of the functions of the Technical School here has been catering for commercial training. The teaching of commercial subjects seems not to have been very warmly advocated by the Department. I think that is a mistake, for this reason: we are a country that has to do a great deal of distributing and a great deal of clearing; we have to collect our raw commodities, and we have to distribute our imports. That must mean necessarily the employment of a comparatively large clerical staff. If we are going to have clerks at all, it is better we should have efficient and well-trained clerks rather than those who have picked up their commercial training as best they could. The subjects typewriting and shorthand particularly have been condemned because of the fact that they are not taught until the students perhaps have been at secondary schools. I do not altogether agree with that, for this reason: that particular class of work—shorthand and typewriting—is usually done by girls. A girl seems to be admirably adapted for that kind of work, and it is a class of work that does not require a tremendous amount of brains. It requires a good general education, and a girl, generally speaking, fills her vocation in life and becomes a wife and mother. I see no reason whatever why we should not encourage the teaching of these subjects to girls with the idea of enabling them to earn their living. It is a healthy occupation as a rule, and they are brought into contact with a fairly decent class of people. I think it is better than factory life for girls. It has been stated that the pupils very often cannot spell, and cannot write, and so on. That is largely true, I believe, of pupils coming from the private commercial schools. If you take an institution like ours, where the girls receive a certain amount of instruction in typewriting in the first and second years, you will find that we devote five hours a week to the teaching of English, apart from the teaching of geography, which is probably as much time as is devoted to the teaching of English in secondary schools. When these girls go out at the end of two years into offices you will find that they give very great satisfaction. In fact, one firm here has over twenty of our clerks employed, and various others have ten, twelve, and sixteen of our clerks. Therefore I do not think that the introduction of typewriting and shorthand has caused the general elementary education of the pupils to be neglected. Dealing particularly now with another branch of technical education—namely, the arts side—I consider that the technical schools should take applied art, and for these reasons: It is generally recognized, I think, that if a person is to be a successful designer for any commercial production he is far more likely to be successful if he understands the possibilities of the medium in which the execution of that design is to be carried out. I will take for instance furniture-designing. I take it that the great majority of the men who design artistic furniture are or should be familiar with the actual practical process of furniture-making. I will take as another instance the various art industries in connection with the printing trade. It is absolutely essential in order that the designer may be able to get exactly the result that he wants that he should be familiar with the carrying-out of that design. In many schools this is recognized. In some of the most modern schools in Germany in which you have the applied arts taught they actually carry out in the schools the very designs that have been made; and if you are going to divorce the design from the actual work of carrying it out, by having the design made at one school and the actual carrying out of the design done at another, it will be a great mistake. I would like to say a word with reference to the art side of the Technical School and the alleged overlapping that has taken place. The teaching of art has gone on in the Technical School for many years. When I came here in 1903 there was some art teaching, and there was no question at that stage of overlapping, though there was a class of exactly the same character at the Elam School of Art. Soon after I came here I visited many of the primary schools and saw the state of the drawing there, and I suggested to the Board that what was required really was the training of teachers to fit them to give proper instruction in the primary schools. The Board imported from Home an art master who had had considerable experience in this work. In fact, the Chief Art Inspector in England told me three years ago that he was probably the best man in England we could have got for the position. His first work when he came here was to take classes of teachers. These were in the evenings, of course, and on Saturday mornings; and then he visited the schools and advised the teachers as to the carrying-out of that work. The net result of that has been that I believe at the present time the art teaching in the Auckland primary schools is second to none in any part of the world. I had the pleasure of attending the International Art Congress of 1908, and the general work of the majority of the schools represented was decidedly inferior to that carried out in Auckland. Side by side with this instruction of teachers we instituted classes for technical students in various branches of art, such as drawing in connection with cabinetmaking, carpentering, the printing trade, and so on, and gradually the thing grew until we had to get a second art instructor, who has to devote a part of his time to the Technical College and part of his time to the teaching of teachers and also to visiting the schools. That is the position so far as the art teachers in the Technical College are concerned. It is only in a period of several years that some brilliant art students will appear, and if they are going to carry out applied art on commercial lines, either in connection with the printing trade or any of the other local art industries, it is very necessary they should receive advanced instruction, and one of the most important subjects required for art students is drawing from life. However, this we did not institute until after I came back from England. Then a deputation, calling themselves the Advanced Art Workers of Auckland, waited upon me and asked me if I would endeavour to institute a life class. They were all connected with some art industry or other, or interested in art in the direction of getting special training. The first question I asked them was, "Why do you not go to the Elam School of Art?" The answer they gave me was that they did not get the instruction there, and they said, "If you will allow your art instructor, Mr. Wallace, to take the life class we shall be prepared to attend." That is how the life class started. Recognition was granted by the Department, and in the following year was refused after representations probably from

the Elam School of Art. The other advanced art work that is going on in the College is in various branches, such as, for instance, designing in leather-work and designing in stencilling, and so on; and I may say the instruction that has been provided has been so efficient that all the better students have been attracted to go there. And I think it would be a very great pity if they were debarred from going to these classes, because in many instances they are attending side by side other classes in the College. Well, we then dropped the life class at the instigation of the Department. What has been the result? These people who would not attend the Elam School of Art started a life class on their own account, for which they provided a model. But they had no one to criticize. Some of them again came to me and said, "Will you endeavour to give us the instruction we want, because we are practising, but the result is practically nil on account of our not getting criticism of our work." As a result a life class has been started again at the College, but these students have simply to pay the fees, and, of course, there is no capitation from the Department in any shape or form towards the instruction.

4. *Mr. Kirk.*] Why do you not send them back to the Elam School of Art?—They will not go, because they say the instruction there is not efficient.

5. Are they capable of judging?—They are some of the best art students in the Dominion.

6. They think they can get better instruction at the Technical College?—That is the point. I would like to deal briefly now with the matter of agricultural education. That is undoubtedly the most important branch of education in the Dominion. It appears to me that for a number of years we have not realized the fact that the whole of the prosperity of New Zealand depends on the land. And I would like to utter this word of warning: that probably in the next five or six years we shall find that South Africa is very seriously competing with us in the Home markets. I know that before Lord Milner vacated South Africa he had outlined a scheme of agricultural education which included co-option. This was drawn up with the advice of some of the best experts in the world, and as soon as Mr. Botha came into power he was broad-minded enough and knew enough to see that this was a very valuable report. That report has been adopted and is now in force in South Africa, with the result that in a very few years we shall find very great competition from South Africa in the produce of the land. I would also like to say that it appears to me we cannot altogether divorce ourselves from what has happened in New Zealand in considering the future of agricultural education. We have rightly or wrongly brought about an artificial state of affairs which has meant high wages for the trades in the towns. We have bolstered up the trades of the town at the expense of the country. The result has been that it has been very difficult to obtain labour in the country, and we have brought about a state of white slavery for children that is probably unequalled anywhere. I refer particularly to the milking that is done by children in the backblocks. Taking all these things into consideration, I think we have to look around and see if there is not some way to produce in New Zealand the very best commodities at the lowest price, so that we may be able to compete in the markets of the world. Briefly, it seems to me that our agricultural instruction should begin in the primary schools. This would, of course, entail school-gardens at all the schools, and the efficient training of the teachers to carry out the work. I still maintain it is just as important to teach this work in the city schools as in the country, because the problem of the world to-day is to stop the migration to the towns, and I think if the children in the town schools are given an opportunity to carry out some of this work in connection with school-gardens they will probably get a taste for it, and that when they come to choose an occupation they will want to go back on the land. In most cities there are domains and parks in which portions of land could be set aside specially for this purpose. The domains and parks are the property of the people, and what better use could they be put to than to provide instruction of this kind, which would be reflected in the additional prosperity of the whole Dominion? Having made this compulsory in all our schools, we should next take steps to do away with the small schools by consolidation, and in the consolidated school provide special instruction in elementary agriculture, including fruitgrowing, poultry-raising, beekeeping, manual training, and domestic science. The children could be conveyed to these consolidated schools; and in this connection I would like to point out that in the past there has been practically no co-operation between the Railway Department and the Education Department in the matter of running trains to suit the pupils. I think that is a matter that requires looking into, and I am quite sure that if it were arranged we could get many pupils conveyed to a central school who at the present time have to go to these small scattered schools. In addition to these consolidated schools, which would in the country provide the higher branches of education similar to the district high schools, we should have special agricultural schools in certain districts at which pupils would not attend until about eighteen years of age. They would attend by means of allowances from the Department, and they would obtain a thorough groundwork, which would benefit those who required to go on to an agricultural college, one of which, I think, would probably be quite sufficient for the Dominion. This would be an institution probably costing £250,000, all properly equipped, and would be established on the lines of the Macdonald College at St. Anne's in Canada. This college then would provide agricultural instruction of the highest type, and at such a college, too, our teachers would get special training for teaching agriculture in our consolidated schools; and also arrangements could be made for giving short periods of training there to teachers who are going to teach in the primary schools. Then, in addition to that we might have our farm-apprenticeship schools, where we could turn out excellent farmers and managers of farms. If we had such a scheme as I have briefly outlined we would probably find that the return to the country would be a hundredfold, taking into consideration the fact that practically the only industry in New Zealand is that of agriculture.

7. *Mr. Davidson.*] I understand you favour the reorganization of our system of education in such a way that Education Boards or similar bodies shall control the primary, secondary, and technical education within their district?—That is so.

8. Would you have the teachers and Inspectors of the Dominion paid on a Dominion scale and controlled by the Department?—That is what I advocate. The teachers would not be actually controlled by the Department, but by the local Board of Education. But the Inspectors would be directly under the Department.

9. In this district the manual instruction in connection with the primary schools is under your control?—Yes.

10. Do you think it is wise to have both primary and technical education controlled by the one authority?—I do. If you were to carry out what I have advocated, then you would probably have one official, the same as they have in America in some districts, and in England generally. In England, for instance, the County Council controls the whole of the education in a given area, and it has as its chief official a Director of Education, who is responsible for the whole of the education, whether primary or technical or manual. Of course, he has under him various experts, but he is the chief responsible official.

11. I understand you object to the capitation grant as the method of providing means for carrying out manual instruction?—I think it is altogether too tedious and too expensive. It is generally recognized now that a subject such as brush drawing is part and parcel of the primary-school curriculum, and why give a special capitation for that any more than for the teaching of geography? If you are going to continue the present system of Boards I would suggest that the Department should give a sufficient sum to the Board, and let the Board provide the necessary payment out of that fund.

12. That would do away with the necessity for so much clerical work?—Yes, and therefore save expense.

13. Can you account for the difference between the number of schools in the Auckland District receiving manual instruction as compared with the number in other districts: for instance, I find that in Auckland 43 per cent. of the primary schools have manual instruction, while in Southland 97 per cent. have it, and in Wanganui 93 per cent. have it?—I think I can readily account for that. It is because of the very large number of small single-teacher schools here, and the half-time schools, in which hand-work is not compulsory. I think Auckland Province is probably unique in the number of these schools. So far as the teachers are concerned, I think there is no Board in New Zealand that has done so much for the training of teachers in this work as the Auckland Board. Over a thousand teachers during the last ten years have received special instruction in the teaching of art and hand-work.

14. I find that the percentage of revenue used in connection with the administration of technical education amounts to 12 per cent: do you think that is excessive?—I think it is generally recognized that from 10 per cent. to 15 per cent. is a fair sum.

15. You remarked that the Department discouraged a course of instruction in commercial subjects?—That is so.

16. I find in taking out the figures that the number of pupils who qualified for capitation is equal to 50 per cent. of the whole: do you not think that indicates that the Department has encouraged, rather than discouraged, a course of instruction in commercial subjects?—I will show you exactly what I mean by concrete example. In 1908, when I was in England, the Department gazetted new regulations regarding the payment of capitation in day technical schools, and suggested that instead of paying on 800 hours, as it had been doing in the case of commercial subjects in a day technical school, it would only pay on 400 hours. There was a good deal of controversy up and down the Dominion about it. Eventually the Department agreed to pay on 800 hours for that year, and the next year it was to be 600, and after that it was to be on 400 hours. However, these regulations have since been revised, and the payment made in the day class is the same for commercial work as for the other branches, but for the evening classes under the new regulations published in 1911 the capitation rates paid for commercial classes are very much lower than the rates paid for arts and science, and so on.

17. What is your opinion on the subject of typewriting: could not typewriting be taught during, say, the last term of the pupil's course?—Yes, it could; but if it is taught properly it could be made a useful adjunct in connection with other work. For instance, there is no doubt a typist is taught better if, instead of having a concentrated thirty hours during one week, the pupil has thirty hours spread over thirty weeks. If the work is correlated in this way, and use is made of the typewriter for science notes, &c., it tends to neatness, and helps in the teaching of typewriting.

18. It has been said that the course of typewriting has been used really as a capitation winner: you do not agree with that?—That is not our experience, and I can only speak of our Auckland experience.

19. I think you strongly approve of local taxation for the purpose of raising funds for all educational purposes except the payment of teachers' and Inspectors' salaries, the amount so raised to be subsidized by the State?—Yes, to the extent of £2 for £1 raised. I do not mean to convey the idea that I advocate the whole of the money required for education, except salaries, being raised locally. The point I intended to make was this: that all teachers' salaries should be paid as at the present time according to a colonial scale out of the consolidated revenue; that local taxation for education, subsidized by the State, as I have mentioned, should be compulsory; and that the colonial scale of salaries should then be looked upon as the minimum rates. Then a Board of Education in any district could provide out of its ordinary revenue any increases to salaries of any teachers if it deemed such increases necessary.

20. Does your personal experience go to show that where such a system is in operation, greater local interest is taken in education, better supervision is exercised, and that altogether you have a more efficient system?—Undoubtedly. I have no doubt about that. One can lay it down as an axiom that money spend locally should to some extent be raised locally.

21. *Mr. Thomson.*] Why should a national work be a local charge?—Largely to increase emulation. I think there is very little of that in New Zealand. What happens at the present time? I will take technical education as an instance. Auckland raises a sum of money and gets a pound-for-pound subsidy. Then some other town like Christchurch will get practically the same money given to it for its technical school without any consideration as to the amount that has been voluntarily contributed in the district. If you make each district to some extent depend on its own efforts, undoubtedly you will arouse a much greater interest, and you will also prevent the anomalies that have been occurring in the past. Many districts are favourably treated in comparison with others. If you take Napier and look at the returns for grants for technical buildings and equipment in the last ten years you will find that it works out at something over 10s. per head of population, whereas if you take a return of the same grants for Auckland you will find it works out at something less than 2s. per head.

22. Are you including in that the cost of the new Technical School you are going to open shortly?—So far as that building is concerned, we have not received a penny from the Department, except in the way of pound-for-pound subsidy. We have been promised £4,000 for equipment, but we have raised something like £3,000 locally in addition to the gift of £10,000 from the Auckland Savings-bank.

23. What is the main purpose you desire—is it the mere spending of money or the mere acquisition of buildings? In addition to what you got locally you do not wish us to believe that the State should come along and give you money for the purpose of giving it?—Yes, because we require it. We have now an emasculated building—three stories instead of five—and when we go into it we shall have to continue renting shanties to carry on.

24. Speaking as the Director of Technical Instruction in the Auckland District, can you say that in your opinion there is waste and extravagance in connection with the administration of technical education?—We put it this way: that the same money could be spent much more efficiently than it is being spent at the present time.

25. Can you specify any particular direction?—I think there is too much money spent probably in erecting buildings in some country places for technical education. I believe that Feilding received something like £1 per head of the population for its Technical School.

26. You consider that there should be centralization in connection with technical instruction instead of having all these small schools?—No; I believe in having one good central school where there is a big centre of population, but I also believe in having consolidated schools in such places as Hamilton, for instance.

27. Do you not think there is a general complaint against the carriage of children in Standards V and VI to central manual schools even—that it is looked upon as a waste of time and effort?—I should not say it is generally: I should say so in some cases. Generally that feeling is caused through ignorance on the part of those concerned. But you very often find that after pupils have been attending manual classes for a little while, instead of opposition being shown, other schools in the district ask to be included.

28. How are you going to consolidate all the schools of a district when the people object to it?—The people objected to it in America in the initial stages, but not now when they know what it means.

29. What do you consider the first essentials of a good sound education?—A thorough knowledge of the mother tongue, in order that the individual may be able to express himself or herself clearly and forcibly and have a knowledge of what he or she reads, &c.

30. I suppose you are aware that men who have employed large numbers of boys have expressed the opinion that a boy's education to-day is not to be compared with what it was before we started manual and technical instruction in New Zealand?—I have heard that opinion expressed, but I do not think they are competent to judge from an educational standpoint. A boy may have been able to do certain routine work better under the old system than under the present system, but that does not say he was better educated.

31. Supposing you got a boy or a girl who could write shorthand or do typewriting, and you found their spelling was bad and their grammar weak, what would you infer?—I would infer that they had not received the instruction that they should have in these subjects. But one could not say that altogether, because, if you take spelling, I know that one of the greatest professors in England could not spell at all. You cannot judge by an isolated case.

32. Would you not infer we are trying to do too much with the primary-school child?—I do not think we are trying to do too much, but we are trying to do it in the wrong way. One of the greatest troubles at the present time is that we try to teach a hundred children as if they were so many marbles cast in the same mould. If we are going to give a first-class education we want a much smaller classification than we have now, so that we may be able to teach each child as an individual.

33. You say the teaching of commercial subjects in technical schools is not favourably entertained by the Department: do you not think it is better to confine that to the high schools in order to prevent overlapping?—I do not think there is any overlapping at the present time. As a matter of fact, the Grammar School does not teach commercial subjects in the same way. All this overlapping that is now talked about would be entirely prevented if you had the one authority controlling all education. That, to my mind, is probably a necessary change that should take place in this country.

34. In regard to the instruction of women in domestic subjects, do you think it would be a good thing to have hostels in connection with the secondary schools in which the girls could receive all the necessary instruction without being made school subjects?—It would be very excellent, but it would cost a fabulous sum to provide for the training of every girl in them. Somebody suggested a hostel for twenty girls, but twenty is a small percentage of the female population. The hostel system is undoubtedly excellent. I have in my mind a scheme for the training of girls for domestic service by which we would give them some special qualification which would be recognized by mistresses, and would mean better wages and better conditions, and more efficient service on the part of the girls.

35. So far as the Auckland District is concerned, you think the expenditure on buildings for technical nstruction has not been sufficient ?—It has not provided anything like for the necessary requirements compared with other countries. We must take this into consideration, that the value of money here is less than in European countries. Probably a building that costs £20,000 here could be built for £10,000 at Home.

36. *Mr. Kirk.*] You advocate the consolidation schools, as is done in the United States ?—Yes, and in Canada.

37. What States of the United States do it ?—Ohio is one which does it most, and they are doing it a good deal in Nebraska and Illinois.

38. Why are they doing it in these States ?—To get greater efficiency largely.

39. Is it not a fact that the effort to get that greater efficiency has become necessary owing to the scarcity of teachers ?—I do not think it makes a very great difference in the number of teachers actually employed. It means a saving of the time of the teachers certainly. I know there is that difficulty in many States. Of course, as you know, education in America differs a great deal in different States, and I do not think that in the States in which consolidation has taken place there has been that dearth of teachers. Of course, I am speaking without having looked the point up.

40. Do you not know that it is a fact that as a general rule they are suffering very much in the United States and Canada from the lack of teachers ?—From the lack of male teachers.

41. I say from the lack of female teachers ?—Not to the extent you seem to imagine. I have been through America twice, and I would not say I am under that impression.

42. Did you make inquiries on the point, or are you speaking generally ?—I spent all my time in making inquiries, and, speaking generally, whilst there is perhaps a scarcity of well-qualified teachers, I do not think there is much difficulty in getting teachers of a kind. There is a scarcity in Auckland and Southland of qualified teachers.

43. Is not that one of the factors that has contributed towards these consolidation schools ?—I do not think it has the slightest effect.

44. Do you know anything about the payment of teachers in America ?—Generally, there again they differ—they are amongst the highest paid and the lowest paid. In some States they are very highly paid, and in some very poorly paid.

45. In the majority of the States they are poorly paid ?—In the country schools. In the big towns they are better paid than in any part of the world.

46. You believe in taxes being raised locally ?—Yes.

47. What was the contract price for your new Technical School ?—£20,882 for the portion that has been put up.

48. What is it actually going to cost ?—I suppose, £2,000 on to that. We found that the sub-basement could be turned into a caretaker's house.

49. With equipment, what is it going to cost ?—It ought to cost, with equipment, fully £35,000; but it will not cost £30,000.

50. Do you think you would have a bigger chance of obtaining that money if each individual ratepayer had a voice in voting upon it ?—I think so. I think if to-day the Auckland City Council were putting loan proposals before the public and included a sum of £10,000 for the Technical College it would be voted for, as they voted at Devonport for the manual-training school.

51. And supposing the sum was £35,000, do you think you would get it ?—I do not know whether we would at the present time. It is not necessary to raise £35,000. There is a subsidy of £1 for £1, and all we want is from £12,000 to £14,000 to finish it.

52. What justification do you urge for your contention that technical-school teachers should receive greater salaries than primary-school teachers: you do not agree with those who say that the greatest work in life is the training of the young ?—I do; but the labourer is worthy of his hire, and it is not every man who will make a personal sacrifice at the expense of his wife and children for the sake of education. Such men are exceptional.

53. You do not think primary-school teachers are making this sacrifice to the extent of 100 per cent. ?—I would not agree with you.

54. *Mr. Wells.*] How do you propose to elect your Education Boards ?—On the parliamentary franchise.

55. Would you make no special effort to secure the representation of men interested in university or technical work ?—I mentioned I would co-opt.

56. Then, you would not approve of a Board of Control for technical education in Auckland ?—Under present conditions I would. At the present time the Technical College has to go cap in hand to the Government for everything it wants. If we had a Board of Control it would mean that each of the bodies having representatives on the Board of Control would have to contribute. It is purely a financial matter, and, to be candid, I would welcome any Board that would find money.

57. Do you think there should be a Dominion scale of salaries for the teachers in the manual schools ?—For all teachers.

58. You mentioned that you thought no students should enter a training college under the age of twenty ?—That is so.

59. He would still be two years in the training college, so that he would be twenty-two before he began to earn a salary ?—At the present time, if a boy wants to become a carpenter or a plumber he has to undergo a six-years apprenticeship, and he is earning a much smaller wage than a pupil-teacher is getting. If it is necessary to train a carpenter or a plumber for six years until he is twenty-one, surely it is necessary we should devote more time to academic training for teachers.

60. But a full-fledged carpenter will earn more at the end of his apprenticeship than a student just out of the training college ?—He should not do. He will earn £2 10s. a week.

61. You do not think if the age were raised it would lessen the supply at all ?—It would at the present time, but you would have to make the profession more attractive than it is at the present time.

62. How long have you been training teachers in woodwork and cookery ?—We have not been training any at all. We have had a sort of makeshift business. We have taken girls for two years at a cookery centre, and they have spent most of their time in the day assisting, and in the second year they give a certain number of demonstrations and practical lessons. Many of them have turned out very satisfactorily, and others, of course, we have never employed at all.

63. But a large number of country teachers have had training in woodwork ?—Only the teachers who attend on Saturday morning.

64. You still find it necessary to import woodwork and cookery teachers ?—We have not been able to give sufficiently high salaries to attract them. There were several primary-school teachers, and generally the best primary-school teacher has been the best man at the woodwork, but he would not think it worth while to leave primary-school work and the chances of promotion in order to become a woodwork instructor.

65. Is it not exceedingly important that a man who is going to teach woodwork should become a teacher ?—I would put it the other way round: I prefer a well-educated artisan who trains for a teacher.

66. *Mr. Pirani.*] I suppose in your idea a large number of students in a centre could be taught very much more cheaply than students scattered all over a thinly populated district ?—Undoubtedly.

67. How do you account for the fact that there are comparatively so few students in the technical classes in Auckland ? In Wanganui this year we have something like 800 students with a population of 10,000, while in Auckland, with a population of over 110,000, you had an attendance of 1,300 in 1910 ?—Different places will differ so far as appreciation or recognition of the value of education is concerned, but I think the position in Auckland is largely due to our lack of accommodation. I have no hesitation in saying that if we had better facilities we should have three or four thousand students here. If you saw the shanties we have had to work in you would wonder not that we had 1,300 pupils, but any at all.

68. When the new Training College is fit for occupation, do you think it would be advisable to have compulsory continuation classes there ?—I think so, undoubtedly, provided you make it in the daytime. That system is gradually spreading over Europe.

69. You would not be in favour of compulsory night classes for boys and day classes for girls ?—I do not believe in evening classes at all. If you are going to consider the future of the nation you must not compel boys who have been working very hard for eight hours a day to attend classes in the evening for two hours and a half, or whatever time it may be in the evening, with the study that entails. From my experience it is no use boys simply attending the classes and going away again; they must do individual work outside. The teachers can do the teaching, but the boys must do the learning. I understand that the amount of compulsory attendance mentioned in the Act is five hours per week.

70. Surely, compelling them to attend five hours per week would not mean occupying every night of their week ?—No; but I do not think it is a good thing even twice a week.

71. *Mr. Hogben.*] Do you know how many medical inspections of each child was recommended by the International Conference on School Hygiene last year ?—I think it was twelve.

72. Do you know that the Conference recommended three in the whole course of a child's school life ?—I was not aware of it.

73. You would not agree with that ?—I would not disagree with that at all. I was merely giving my opinion as a layman. If experts who have studied the matter and gone into it thoroughly say three times is ample I would say I bow to their judgment.

GEORGE JOSEPH GARLAND examined on oath. (No. 23.)

1. *The Chairman.*] You are Chairman of the Auckland Education Board ?—Yes.

2. How long have you been in that capacity ?—This is my second year. I was a member of the Board for six years. I have been a member and Chairman of School Committees for twenty-five years. I may say I have not prepared any statement in reference to the subject-matter of your Commission, but I will be pleased to answer any questions.

3. *Mr. Davidson.*] Are you in favour of the present method of appointing teachers in the Auckland Education District ?—Yes.

4. As a former member of a School Committee, do you see any objection to it ?—I think the present system is preferable to the one we had some years ago.

5. What is your opinion as to the size of the Auckland Education District ?—I think that probably for the next two or three years the Auckland District should be left as it is; but in the near future, when the Ongarue line is put through to Stratford, that country served by the railway which is now under our control will naturally fall, in my opinion, into the Taranaki District. Again, there is a large district to the eastward of Taupo and running down to Hawke's Bay that I think will naturally fall to the Hawke's Bay Board in the near future. But until the railways are opened and facilities for transit given I think the district should remain as it is.

6. Do you think that if part of the cost of education were thrown upon local taxation it would lead to better administration and greater economy and increased efficiency ?—I do not.

7. If the cost of the upkeep of the school buildings were raised locally, and the amount of taxation were subsidized by the State, would that not lead to a closer supervision of expenditure ?—I do not think so.

8. What is your opinion on the question of the control of the inspectorate: do you think that the body that has the framing of the syllabus should have the control of those who have the interpreting

and working of the syllabus?—As far as I can judge the inspectorate would be better if it were universal, and if what one might call a universal interpretation of the syllabus were given. I think something might be done in that direction. A great many teachers, so far as I can judge—I am speaking now of country districts—would have something definite to go on instead of having to interpret the syllabus for themselves.

9. Have you noticed the great difference in the salaries paid to Inspectors in different parts of the Dominion?—I have not noticed that. I thought they were about equal. We have a stated salary for the Inspectors, and a special allowance for the Chief.

10. *Mr. Poland.*] Would you expect the Chief Inspector of a district such as Westland, which has as many pupils as there are in the Mount Eden School, to have the same salary as the Chief Inspector of a district like Auckland?—Certainly not.

11. Would you advocate that the various education districts in New Zealand should be made more uniform as to the area controlled by each Board?—I think it would be a wise step if some were amalgamated. While some education districts may be considered to be too bulky, others, in my opinion, are on the small side. It is just like a large school—it does not cost so much *per capita* to teach a large school as a small one.

12. You think the larger districts would tend to economy in administration?—I should say so.

13. Do you advocate any alteration with regard to the functions of Boards and School Committees, or do you believe that the present functions of School Committees are sufficient?—I think School Committees do very excellent work, and I do not see why they should be displaced in any way. They are the local people, and they understand the local surroundings. They take care of the property of the Board, which is the property of the State, and I think the nation as a whole has a great deal to be thankful for.

14. Would you be in favour of the functions of Committees being extended, say, in the appointment of teachers?—No. I speak advisedly as an old Chairman of Committees. I will tell you why. The persons who see the teachers at work are best qualified to judge as to the best teachers, and promotion should be given according to the ability of the teacher.

15. Can you suggest to the Commission any means by which we could reduce the expenditure on education out of the consolidated revenue?—Well, you cannot cut down salaries, and you cannot cut down building grants. Buildings must be furnished to teach the pupils in. You cannot help the increased cost which has been going on in timber and other materials, to say nothing about labour. You cannot economize there. The price of land has also gone up, and you cannot economize there. I fail to see where you can effect any material saving in the grants for education.

16. You approve of control being exercised over the expenditure by the Department?—I think it is absolutely essential.

17. Does the Department always accept the recommendations of the Board?—No, not always.

18. Does the Department make investigations on its own account?—At times, yes. I may say that since I have been Chairman the Department has treated us perhaps with a little more liberality than in former years.

19. *Mr. Kirk.*] Assuming that a Dominion scale of promotion for teachers was in operation and that several applicants for a position were all on the one grade, would you favour all these names being sent on to the Committee for selection and allow the Committee to choose one?—I do not think that position could arise. It might be possible, but I do not think so.

20. Supposing three men on the same grade applied for a position, would you or would you not favour these names being sent on to the Committee to make a final choice?—I would much prefer the choice to rest with the Chief Inspector and the Inspectors rather than with the Committee, because it is only the men who see the teachers at work who are capable of judging, in my opinion. You might just as well spin a coin otherwise. As to Dominion promotion and a scheme for grading, I should be delighted to see that in operation. It is one of the things I brought before the Institute here some years ago, soon after I became a member of the Board, and in that scheme, which was sent on to the then Minister, provision was made for a Court of appeal to be set up. I suggested in my scheme that the Inspector-General should be Chairman of that Court of appeal, and that the other members of the Court should be the Chief Inspector of the district and some other person whom the Board would appoint, a member to be appointed by the Minister, and a member to be appointed by the Institute—five in all. The Court of appeal would take these things into consideration; allot to each man the position it considered he was best qualified to fill, and then if the man felt he had a grievance he had this Court of appeal to appeal to. I think a grading scheme for the whole of the Dominion is a very excellent idea, and one I should welcome most heartily. I trust when the Commission makes its finding it will give that question due consideration.

21. Have you any suggestions to make as to an extension of the powers vested in Education Boards, or are you satisfied they have reasonably sufficient powers now?—I think our powers are reasonably extensive. I am not hankering after greater powers.

22. Would you or would you not consider the granting of power to an Education Board to retire compulsorily at the age of sixty any teacher who they considered should be retired?—I have bestowed some thought upon that, and that is one of the questions which, in my opinion, a Board of appeal or of experts ought to judge rather than a Board of Education. I know there are cases where the retirement of certain teachers would be advantageous to the schools, but we do not wish to inflict any hardship, and so we have to be very careful and cautious as to what action we take. We retire teachers now at the age of sixty-five, and we have found that works very well so far.

23. Do you think it wise and advantageous and in the best interests of the students that there should be the optional subjects which are now to be found in the syllabus?—Yes, I think it is wise to have the syllabus elastic enough to take in the various subjects therein mentioned. I approve of

the syllabus. It is in the interpretation of the syllabus that the difficulties arise, particularly in the small country districts. I am speaking of the primary schools.

24. Speaking of the secondary schools, you know a boy can if he likes choose such subjects as typewriting, shorthand, and book-keeping: do you think it is wise that the time of school life should be taken up with instruction in these subjects?—I am rather of opinion that the time devoted to these subjects would be far more profitably devoted to agriculture.

25. Mr. Leys was before us to-day, and, speaking as a business man, he said he did not think it was advantageous to have these subjects taught, and that the boys coming to him, at any rate, showed a lack of knowledge in what he considered to be the essentials?—That has been my experience too.

26. Do you think then that more time should be devoted to the essentials?—Yes.

27. *Mr. Wells.*] Can you tell the Commission how that grading scheme is being viewed by the teachers of the Auckland District?—I have not met a single teacher since it has been in operation here who has expressed regret at the scheme coming into operation. Of course, I have not seen them all.

28. In your opinion has the institution of that scheme resulted in less canvassing and log-rolling?—Yes, there is none now, because the Board has divested itself of all patronage.

29. Can you recommend that scheme to other districts from your knowledge of it here?—Most heartily.

30. Do you approve of the present system of electing Boards?—Until a better one can be found.

31. Do you think that election on the parliamentary roll would be any improvement?—I am afraid it would not be very much of an improvement. I am speaking generally. Since I have been a member of the Board I do not think there has been 2 per cent. of the votes that ought to have been recorded that have not been recorded, and we have had no informal votes for the last three or four elections. That shows me, at any rate, there are intelligent men exercising the privilege, and that they most religiously look after it. It is very rare to have a voting-paper coming into the office after the day specified by law.

32. You are not prepared to recommend any better scheme than that at present in existence?—I do not see any better one.

33. Do you find any undue delay in getting new schools built?—At times we have had delays, but I cannot recall an instance just now.

34. Can you tell us anything about the want of modern conveniences in teachers' residences in this district?—That trouble was largely overcome by the schools being grouped and a sum being specified for each group for necessary alterations. There are only a few still to be done.

35. Do you think anything could be done in this district in the way of centralizing country schools—closing three or four schools and opening a central one?—There are places where railway facilities obtain where that could be done, but I do not think there are many.

36. Probably the cost of conveyance in this district would be higher than in many other districts?—Yes, I should say very much higher than in Canterbury.

37. Do you think there should be differential rates for the different districts?—That might overcome it, but it would be very hard to adjust matters.

38. In regard to retiring a teacher at the age of sixty, do you think that when a man has got past his best work in a position of some responsibility he should be allowed to apply for a less difficult position without jeopardizing his superannuation at all?—I see no reason why he should not take a lower-grade school if he wished it.

39. You think that would be in the interests of the service?—Certainly, because it would induce young men to come in.

40. *The Chairman.*] What burden would that cast on the superannuation fund?—Probably £15,000 or £20,000 a year: I cannot say definitely.

41. *Mr. Wells.*] As Chairman of the Board, can you make any suggestions by which the efficiency of the system can be improved?—I could make a suggestion, but I am afraid it is outside the pale of practical politics, because it means more money. Give higher salaries and you will get greater efficiency.

42. You think the salaries are too low at present?—I certainly think so in a great many cases.

43. *The Chairman.*] How will you deal with the present difficulty in Auckland in the matter of providing proper playgrounds for the schools?—I am glad you have asked me that question. I think that the law provides that we shall do our share towards additional playgrounds, and we have always been willing to do that. As an evidence of that I may say we found £120 towards the purchase of a piece of ground for the Napier Street School, costing £220. The Department gave us the balance. You know that the Municipal Corporations Act gives power to a Municipality to spend, I think, 20 per cent. of the rates in any one year for the purpose of assisting education. If the extension of playing-areas could be brought within that provision I should say it would be an excellent thing tor the schools in this particular city. I think if the matter was put before the ratepayers they would vote a sum of money for this purpose.

44. Take the school we visited on Friday: how would you get over the difficulty there?—I think that property would cost probably £1,500. If the City Council found £500, I am quite sure my Board would find a third of the cost and the Department would find the other third. There are three other schools, at any rate, that require attention, but that is the worst.

45. What would you get for £1,500?—Not very much, unfortunately.

46. Do you favour casting on the particular locality the upkeep of the schools so far as the maintenance of the buildings and grounds is concerned, or do you think it should come out, as it does now practically, of the consolidated revenue?—I think it should come out of the consolidated revenue.

47. Would it surprise you to know that experience in the educational world has shown that wherever local effort is encouraged by liberal subsidy the result has been increased economy and more

interest on the part of the people of that locality in education ?—I cannot challenge that, but it has not been my experience. My experience is that our system is one that has worked excellently for over thirty years.

48. *Mr. Kirk.*] As land in the vicinity of that school seems to be dear, and as the school buildings appear to be old, is it possible to get any other site which would provide sufficient playgrounds with the moneys which would be realized by the sale of the present property ?—There is not a hope.

49. *Mr. Pirani.*] Is it not possible to get a portion of the cemetery ?—Not while you or I live.

TUESDAY, 11TH JUNE, 1912.

SIDNEY ERNEST LAMB examined on oath. (No. 24.)

1. *The Chairman.*] What is your position ?—I am Lecturer on Engineering at the Auckland School of Mines.

2. And what are your educational qualifications ?—I am a Bachelor of Science of the London University, with Honours in Engineering. I hold an Associateship of the Royal College of Science in Engineering and Physics, and was the holder of a Whitworth Exhibition. The School of Mines in Auckland having proved a failure, the question arises as to what position the engineering classes taught at the school now occupy in the educational system of New Zealand. Classes in engineering have been provided for those engineering students who require an education up to university standard, and which would prepare them to sit for the examinations held by the three premier engineering societies. Success in these examinations, together with the production of satisfactory evidence of practical experience, entitles the candidate to become a member of such a society ; he is then a qualified engineer. A university degree in engineering is accepted in lieu of the society's examination. At the present time thirty-two students are in attendance at the school. These pupils, for various reasons, are unable to study at Christchurch, and yet require a university education. To encourage them to take a systematic course of instruction, including the allied subjects of mathematics, physics, chemistry, and geology, an associateship course has been inaugurated. Six students have commenced the study for the associateship in the first year of its existence. The classes are also attended by architectural students, and by men who are candidates for the Government certificates of licensed surveyors, and for the third-class certificate for marine engineers. As far as pure theory goes, the lectures are arranged up to university standard, but it is recognized that the school is not equipped with sufficient apparatus to give such an efficient training as may be obtained at Christchurch. The authorities at Canterbury College have somehow gained an impression that we are in competition with them for Auckland students who would otherwise study at Christchurch. I say openly that we have no such intention. It is true that only two students have left Auckland to study at Christchurch during the last nine or ten years, but it must be remembered that this lack of students existed before the engineering classes started in Auckland, and to my knowledge five students have left this city to study engineering in England or America during the last two years, and that goes far to explain why so few attend the school at Christchurch. A system of scholarships has been advocated as a means likely to popularize the southern school, and I think some additional students may be attracted by such a scheme. I offer a suggestion which I think might help very considerably towards that end. The system of study for the engineering degree has lately been altered. A student after matriculating may now complete the University examinations in four years, of which the first year of study may be taken at any of the affiliated colleges ; at the end of the first year the candidate sits for the Entrance Examination, consisting of papers on the allied sciences such as are taken for a B.Sc. degree. The subjects for the next or first Professional Examination are—(1) mathematics, (2) technical chemistry or geology, (3) freehand mechanical drawing, (4) descriptive geometry, (5) applied mechanics. All these subjects, with the exception of technical chemistry, occur in the degree course for miners, and the Auckland School of Mines is already recognized for the teaching of these subjects for the mining degree. I suggest that Auckland students be allowed to study for this examination at the School of Mines, and then to complete their training in Christchurch. I am aware that a similar application made to the Senate two years ago was refused, mainly because elementary steam was then a subject for this examination, and it was thought that a difficulty would occur in the following year when students had to study advanced steam. This difficulty has now been removed by placing the elementary steam in a later year. Under this scheme Auckland students would spend two instead of three years at Christchurch, and students who commenced the study of engineering in Auckland would undoubtedly be encouraged to complete their degree by proceeding to Christchurch. This suggestion is deserving of earnest consideration, as I am convinced its adoption would be of considerable benefit to both centres of education. The opinion has been expressed that the Technical College may in the future be able to impart the necessary instruction in engineering to those students who do not require a university education. If a university education means taking a degree, then I dissent altogether from such a view. In my opinion all professional engineers, architects, or surveyors should have the benefit of a university training, whether they elect to sit for a degree or not. This opinion is not antagonistic to the precedent established by other universities ; for instance, one of the latest universities is Birmingham, and there not only is provision made for degree students, but a course is provided for unmatriculated students, at the end of which a certificate is awarded. The latter is on all-fours with what is now done in engineering at Auckland. When the population of New Zealand has increased to such an extent as to warrant the provision of advanced instruction in engineering at the technical colleges, then also another university school of engineering will be required, and Auckland seems to be the natural position for such an addition. In England there is a university college teaching engineering for about every one and a quarter million inhabitants; we find the same proportion in Scotland and Wales. In Australia the proportion rises to one and a half million. As there are one million people in New Zealand to our one engineering college, at some not-distant future there will be the need of a second engineering school, and the Auckland University College is making provision

in a gradual but rational manner towards the fulfilment of such a necessity. The sum that has been spent on buildings and equipment at Christchurch has been mentioned as £30,000. I estimate that the equipment could not have cost more than £12,000. In addition I have gone very carefully into the cost of the minimum equipment for efficient teaching at a school of engineering, and I am convinced that £4,500 would be sufficient for such apparatus. As a matter of fact, an addition of £3,000 worth of apparatus to the equipment already possessed by the Auckland School of Mines would complete this minimum. I do not wish it to be understood that I am advancing this as an argument for the immediate provision of such a minimum at Auckland, but simply as my opinion, as an engineer who has had twenty-three years' experience in the engineering profession, that an exceedingly expensive equipment is not absolutely essential.

3. *Mr. Wells.*] Is it your experience that there is a distinct need for a school doing the work now being done by the School of Engineering in Auckland?—It is. We have proved from the numbers attending the school that there is a demand for the instruction of engineers who cannot go to Christchurch and who do not wish to go there. Possibly they have taken up a wrong policy, but the position is that generally they will not matriculate till they are about seventeen; they have to study for four years at Christchurch in order to get their degree, and then before an engineer will consider them qualified they must serve for three years under a practical engineer. That brings them to the age of twenty-four, at the minimum, before they are qualified engineers. One plan which some of them will persist in following is to take their practical training and theory at the same time. They can then qualify in five years instead of seven, and can then earn a certain amount of salary at twenty-two instead of twenty-four. Nevertheless, I think they should be encouraged to take the degree.

4. Can the training these students are in search of be obtained anywhere else in Auckland?—No.

5. *Mr. Hogben.*] Would you propose to include in your associateship in Auckland a course in civil engineering, and another course in mechanical engineering, and a course in electrical engineering?—When we started we included all three, but I have come to the conclusion that for the present, at any rate, there is not very much demand for the associate course in mechanical engineering. Practically the whole of our students are studying civil or electrical—the bulk of them the civil course.

6. You propose to establish an associateship in civil and electrical engineering, especially civil?—Yes.

7. What proportion of the subjects required in the degree for civil engineering would you take in the associateship?—Neither of the special subjects, such as railway or borough engineering. I would treat it from the general engineering point of view, similarly to what is done in the London University. The number of students here does not justify specialization.

8. Would you take advanced surveying, including geodesy?—Yes.

9. Building-construction and strength of materials?—Yes.

10. Hydraulics?—Yes.

11. Would you take hydraulics practically?—As far as we are able with our apparatus.

12. Is not the installation of hydraulics apparatus rather costly?—I do not think so. At other universities the hydraulics apparatus is the least expensive.

13. At Manchester, for instance?—Manchester is a special kind of thing. They are in the middle of a vast industrial district, and they have plenty of money. A good many of the hydraulic experiments can be done with inexpensive apparatus, if you like to experiment with it rather than the more perfect form. You can get the same results.

14. Are the results reliable?—Your experiments are taken with reliable instruments, therefore the results must be reliable.

15. Do you think you could have really good work in strength of material without expensive apparatus?—The most expensive is the testing-machine, and there seems a favourable opportunity of getting that in the near future.

16. Do you not think that if it is done at all it should be done in the same style as for standard tests?—It is not absolutely necessary. Millions of tests have been done in the universities in the last twenty or thirty years. Taking the case of a forged bar, whether you turn that down to $\frac{3}{4}$ in. or $\frac{1}{2}$ in. diameter experimental results have proved that there is absolutely no difference between the results.

17. What about granite?—You simply use a block of smaller size.

18. Are the results the same?—Absolutely the same, unless you get very small blocks. For instance, at Durham University they have only a 20-ton testing-machine.

19. You think you can teach as well with a 20-ton tester as with any other?—You can teach the principles as well.

20. Do you think you can give all the practical work that is necessary for a further expenditure of about £3,000?—Yes.

21. You wish to take the work for the first two years for the engineering degree?—Students are already able to take the work for the first two years at any affiliated college. We are only asking for one extra year. Taking the subjects in the first Professional Examination, applied mechanics is the only one that I think any one could object to, because freehand mechanical drawing and descriptive geometry for miners have the same definition as for engineering, and applied mechanics is one laboratory we are efficient in. I think we have just as much apparatus as at Christchurch, but we have not the models they have for mechanics of machinery. That subject has been cut out of the examinations.

22. What about the cost of model engines that can be used for testing the different elements of the steam-engine?—I have included in the £3,000 a sum of £800 for a 40 h.p. experimental steam-engine and boiler, with the necessary equipment of pumps. My contention is that for any type of steam-engine, except the steam turbine, the test of any one engine is exactly similar to the test of any other.

23. You think an engine such as you could get for that would be sufficient for an engineer to read his indicator diagrams and see what the different elements are?—I believe that is the same size as they have at Christchurch.

HARRY WALLACE examined on oath. (No. 25.)

1. *The Chairman.*] What is your position ?—I am art master at the Auckland Technical College.

2. And what are your qualifications ?—I hold an art master's diploma from the British Board of Education, now known as the Royal College of Art. In addition to that I hold a subgroup certificate for life work, having passed "excellent" in that examination. In connection with figure group I have a first in antique, first in antique from memory, first in anatomy, first in honours design, first in architecture, first in monochrome painting, first in still life, &c. My principal experience has been technical, but I have also been connected with teaching for many years, and have exhibited a number of times as a painter and etcher at the Royal Academy, London.

3. How long have you been in Auckland ?—A little more than eight years.

4. Will you state briefly your opinion with regard to art education ?—First I will deal with my views in regard to the teaching in elementary schools. I have had a good deal to do with work of that description. I do not altogether agree with the changes made in connection with the teachers' certificates under the new regulation. I think too much is required in the way of geometry, particularly for girls. The colour work appears to be to some extent overlooked. I feel very strongly on this point. We have found in Auckland, and I found in the Old Country, where I was supervising classes in the pottery districts, that the introduction of colour work was of very great benefit to the drawing. Personally I am very sorry to see anything introduced that tends to discourage that side of the work. In addition to the interest brought about by the introduction of colour work there is the question of the development of the colour faculty. That does not seem to be taken as being of great account, but to my mind it is one of the most precious of our gifts if we understood it properly. With regard to teaching-certificates generally, I should say that a certificate on the line of the Kensington Art Class teachers' certificate is not quite the thing we need. I know that certificate very well. I hold it myself in addition to other qualifications, and I can say very distinctly that many people who hold that certificate, and have not gone further with their studies, just get a certain amount of executive power, and it seems to make no difference to their taste. The literature of the forward movement in art teaching shows that, particularly in America, they have given more attention to the æsthetic side of things. I think that has very considerable cultural value, and we regard it as a humanizing influence in education. I think the aims and objects of the drawing-lesson should be thoroughly understood, and I would suggest that a method paper be set in connection with the drawing examination for teachers. That is done, I believe, with some of the kindergarten work and brush drawing, but it does not follow through all the subjects. I understand that the Inspector-General has spoken of the desirableness of making life in the country more attractive. I have been asked on several occasions to judge the work in the home arts and industries exhibited at country agricultural shows, and I have seen not only good work done by the children in the schools, but also very praiseworthy work done by young people who have very limited opportunities, in the way of embroidery, stencilling, and pictorial work. I have seen the art faculty exercised in the arrangement of bouquets and other floral displays. I think that that kind of thing is worthy of encouragement, as it helps to stimulate social feeling in the country—helps to give the country people something to think about besides the humdrum work of their every-day life. It could be helped along if the cultural side of education were kept in view, as it is in some of the best American districts. As far as the drawing in elementary schools bears upon this, I say that if greater emphasis were placed upon the design side it would help that kind of thing forward very much. Together with simple talks on pictures and other elementary art matters it would lead to the formation of taste, particularly in the case of girls. It would affect their needlework, flower-culture, house-decoration, and dress. I do not wish to put before the Commission any high-falutin' ideas. My own ideas are on the simple side; but the home influence in the country is one of the things that tend to keep the people there if it is of the right kind. I have spoken of the cultural side particularly as far as girls are concerned. The constructional work could still be retained for boys. I think that the art schools should exist chiefly to help students who are engaged in pursuits in which a certain amount of executive power is necessary. After the preparatory course I think the training should be purely vocational. Design should hold a prominent place, as it is so necessary to architects, decorators, sculptors, lithographic draughtsmen, process-workers, jewellers, and others. I also think that the historic side of art is a very important subject, and should receive particular attention in New Zealand, as we have so little material in the way of building, furniture, pottery, jewellery, &c., on which to form a standard of taste. Superficial pictorial work should be discouraged, but all would benefit by a course of drawing from nature, and provision should be made for those who require a knowledge of those principles which would guide them in making tasteful homes.

5. *Mr. Davidson.*] What is your opinion of the quality of the work done in drawing, particularly in brush drawing, in the elementary schools of the Auckland District ?—It varies in different schools according to the staff, but, taking it generally, I think it is recognized as holding a high place.

6. How does it compare with that of similar elementary schools in England ?—I think it is quite equal to the work in the English elementary schools. I have had a wide experience in that way. I was once invited to attend a special conference in London, through the chief Inspector of Art, on account of my connection with elementary art work. The district in which I worked in the potteries held a high place in art.

7. What is your opinion of the work done in the Technical School, particularly in regard to the training of teachers ?—I think a great deal of good work has been done. I believe that in my time more than a thousand teachers have passed through the art classes, and all have had instruction in model and object drawing. They have also been taught in blackboard drawing with a view to illustrating their lessons, and they have done a certain amount of brush drawing and freehand drawing.

8. Do you think that provision in Auckland for the training of teachers is adequate in these matters ?—We have been working under difficulties ever since I came to Auckland. I should like to see things better so far as room and equipment are concerned.

9. Do you think that the primary, technical, and secondary education in this district should be controlled by one body ?—It would be better if it could be.

10. *Mr. Kirk.*] Are the pictures issued by the Department for use in primary schools the best kind of pictures for the purpose ?—I think they are excellent pictures, but I should suggest something further. They deal mostly with botanical matters, historic buildings, and so on. I think suitable pictures might be selected from reproductions from the great galleries that would be likely to be interesting to the children—for instance, a fine picture with a historic setting, a typical building, or a typical costume, or the type of man represented in a picture, to say nothing of the particular interest of the portrait. I think that might be made exceedingly interesting to the children, and it would help to teach things outside the picture—the historic bearing, for instance; and there are other phases of the subject that might be dealt with in the same way by selections of suitable pictures.

11. *Mr. Wells.*] How much of your time is spent in the primary schools ?—Five mornings in the week.

12. How much of the balance of your time is given to the training of teachers in art work ?—I have classes on Monday, Wednesday, and Friday nights. I also have the teachers' class in the Training College.

13. Do you know if any of this work was done before you arrived ?—No attempt was ever made to supervise the work of the children or to train the teachers.

14. Do you know of any duplication of your work here ?—I do not think there is any overlapping except in the case of the life class. There is another art institution in the city, but I think our work is carried on on technical lines. We have, for instance, seven or eight young architects attending our classes, besides one or two stonemasons and one or two architectural masons who are learning to carve, lettering, and ornamental work. We have painters and decorators to whom we are giving a course of design in lettering, and giving them some information in colour work. We hope that in the time to come they will be able to act as advisers to their clients. You may ask how we deal with all these trades. To return to my qualifications, I may state that I earned my living for several years as a lithographic artist, and when I was in the potteries I was art director to a firm there for seven years, during which time I was engaged in modelling. I also taught copperplate etching under the Staffordshire County Council for four years. In addition to that I spent a year designing lace curtains in Nottingham. This experience gives one a wide outlook in design generally, and enables one to adapt design to other requirements.

15. Do you find that there is a distinct demand from you for that kind of work—*i.e.*, drawing from the living model ?—That is so. But you cannot take higher design work without training in the higher draughtsmanship. I cannot train a lithographic artist, for instance, to make a design in which the figure plays a conspicuous part unless he has some knowledge of anatomy. Consequently, if we have no chance of teaching the figure our technical work is at a disadvantage.

16. *Mr. Pirani.*] What is your salary ?—£325 a year.

17. How many hours do you average in the week ?—I am actually teaching a little over thirty hours, but that leaves no time for preparation. I am working about five or six hours more than an elementary-school teacher. I have a good deal of travelling to do in connection with my visits, and that travelling-time is not counted.

18. *Mr. Hogben.*] Reproductions of historic pictures are in the Department's programme ?—Coloured pictures are more attractive, but owing to the state of the light in New Zealand—probably because it is more actinic—in the three-colour process pictures, which are the best reproduction, the red always disappears, and this upsets the colour values.

19. With regard to the programme for the teacher's certificate, have not the drawing subjects been rearranged ?—Yes.

20. Was brush drawing formerly compulsory for teachers ?—It was not, but there is no brush-drawing examination at present, according to the new regulations.

21. Is not the drawing free drawing with pencil or brush ?—The brush is used in that way, but anybody well acquainted with the technical peculiarities of the pencil and the brush will find that the brush expresses certain forms more freely and more beautifully than any other instrument, whereas the pencil has its own special domain. If you ask any one to execute with the brush what would be better expressed with the pencil you would land him in difficulties. That matter should be cleared up in the regulations.

22. You think, then, that the regulation as it stands might mean that some question would be set to be done with the brush ?—I think it would be generally read that way.

23. In the old syllabus for brush drawing the word "colour" was not mentioned. Would it be a good thing to make it clear that training of the colour-sense as well as the form was intended ?—The only item that bore on the subject was the statement that marks would be given for taste in colour. I have examined in that subject on several occasions. I did not introduce that, but I thoroughly agree with it.

24. Was that in the old syllabus ?—It was on the examination-paper.

25. Then you think the point should be made quite clear in the new syllabus ?—I will think the matter over and place my views before you in writing.

GERALD LOFTUS PEACOCKE examined on oath. (No. 26.)

1. *The Chairman.*] What is your position ?—I am a member of the Council of the Auckland University College, and Acting-Chairman.

2. Will you state the matters you desire to bring before the Commission?—My object in appearing is to emphasize the evidence given by Mr. Lamb on the subject of the engineering classes. The general question I should like to refer to is that of overlapping as between one University college and another, and also between the Technical College and the University. The School of Mining Engineering was started here because it was recognized that this was the greatest centre of gold-mining in New Zealand, besides which there is a considerable amount of coal-mining going on, so that it was the part of the Dominion where there was most need for this kind of education. It was found that there was not apparently a public demand for university teaching in mining engineering. The consequence was that we found ourselves possessed of an equipment, both in the teaching staff and the apparatus, of which we could not make full use. Part of it was engineering equipment, which was practically the same as the equipment that would be required for, at any rate, a considerable part of the course in engineering pure and simple. We therefore thought that in order to make use of the money that had already been spent we should carry on engineering classes—practically up to what would amount to the work of the first two years of the degree course. As much as anything else the object was to avoid wasting the efforts we had made in establishing the School of Mining Engineering. We held the mining part in abeyance, but it was always open to be taken up again if the people of the goldfield and other places should begin to see the advantages of such education in engineering as they would acquire by taking the degree. I think one of the reasons which militated against the school being really utilized by young people was the fact that there are so-called schools of mines at the Thames, Waihi, and Coromandel—schools which take the students only through the elementary part of mining work, which only fits them to become shift bosses and battery-managers, and that sort of thing, but which does not pretend to equip them with the education necessary for a real mining engineer. However, for the present they seem to be satisfied with this elementary part of their education, and do not realize as yet the value of the fuller course. That realization may come when we get a larger population. In the meantime, in order to utilize as far as possible the equipment and teaching staff we had, we thought we would go on with the engineering classes. I understand that Canterbury College considered that this was an invasion of their preserve to a certain extent, and was also contrary to the plan which had been tacitly accepted of specializing in certain subjects in certain colleges. I confess that some years ago, when the late Mr. Seddon gave special grants for specialization, I thought there was a good deal in the idea, but I have come to see that in this country it does not work out as we hoped. It is evidently necessary, in order to give our young people an opportunity of taking the higher courses of education in applied science, that they should be able to get it where they live. I think it is a mistake to encourage the idea of watertight compartments in our college system. A student might just as well, if he has to leave his home, go to Melbourne or Sydney, or England, or America, as go to Christchurch or Dunedin. The only additional cost is that of the longer journey. The cost of his living is the same wherever he goes. As a matter of fact, we find that if students leave Auckland at all they go further afield—to Australia, or America, or England, where they can get larger opportunities. There remains a considerable number of students who, because they cannot get the full course near their home, do not take it up at all, and remain always only half-educated men in their particular line. Therefore we must recognize that the College will have, as the demand arises, to take up these various subjects. Engineering is a subject in which I believe we shall have a large number of students in Auckland. I believe that there are thirty-two students at present at work upon it in our College. I quite agree with Mr. Lamb that we might very well carry them on for the first two years, and so prepare them to go on for their full course at Christchurch until the Auckland College is sufficiently equipped to carry them right through the degree course. That, I understand, would necessitate only a comparatively small increase in the outlay for equipment—something like £3,000, he tells me, would carry a student on to the full degree course. At the same time, I am not supposing that we can do that at once, but I think we should keep the students together in the engineering classes, and give them an associateship for a really advanced course in engineering—not the whole course, but something a great deal more than could be given at the Technical College. That, at any rate, will encourage engineering study, and will do good, and later on the day may come when we may give them the whole course. Any day a mining engineering school may become a public demand, and then we shall be ready to supply that special education in engineering, as originally taken up. With regard to the Technical College, it seems to me that if it gave advanced teaching such as we give now in those classes it would be going outside its proper function. I am simply expressing my individual opinion when I say that there is a tendency in the Auckland Technical School to go outside its province as an institution for purely technical teaching. It seems to me that the instruction that a technical school should give should be what a young man or a girl would get as an apprentice in a properly equipped commercial workshop in the particular trade for which the school gives education. Of course, more of the scientific principle of the trade would be taught than they could get in any commercial workshop, but at the same time it should be more of a trades school than a theoretical scientific school. If the Technical College goes beyond that I think it is trenching upon university work. It appears to me there is a tendency in the Technical College to multiply classes in fancy subjects which become nothing more than capitation-earning classes, and very often are not wanted. These classes are largely made up of children from the primary schools, who never intend to go in for an occupation where this technical work will come in. These classes earn capitation, the result being that technical education is costing more than it ought to cost in proportion to the practically valuable work it is doing. I do not mean to say that it is not doing valuable work, but I fear that many of the pupils who attend are not likely ever to give a return to the State for the money spent upon them, because this kind of education is more or less forced upon them, and is the kind of thing they do not want. This is my personal

opinion, but I know it is shared by many educational authorities in Auckland, and I think the Commission might consider with advantage how far technical education in New Zealand is going outside its proper functions. There must be a certain amount of overlapping between educational institutions—that is to say, they must impinge a little upon each other in order to avoid gaps —but there should be as little as possible. Coming back to the question of the Engineering School, I would say that we have no idea of trenching upon the preserves of any other University college. We do not desire to injure in any way the excellent Engineering School at Canterbury College, but rather to prepare students to go there, but under an arrangement under which they would spend only half the time they do now away from their homes.

3. *Mr. Hogben.*] When you say that the classes at the Technical College are made up of children from the primary schools, do you mean children now on the rolls of the primary schools? —I understand that children come from the primary schools for certain hours of the day to attend the technical classes.

4. Is it not the manual-instruction classes?—It may be. I know they attend the school. Parents have said to me that they looked upon their attendance as waste of time, as their line of life was not likely to be connected with the subjects in which they were being taught.

5. You did not know that the woodwork classes were carried on for the sake of their general education?—I thought that sort of thing was done at many of the schools themselves.

6. Do you know that on the roll of the technical classes you cannot include children who are on the roll of a primary or secondary school?—No.

FRANK HEATON examined on oath. (No. 27.)

1. *The Chairman.*] What are your position and educational qualifications?—I am a Bachelor of Arts and Bachelor of Science of London University, with Honours in the B.Sc. in Physics and Chemistry; also a Master of Arts of Cambridge University, with Honours, and a Senior Science Scholar of Emmanuel College.

2. What was your experience before coming to New Zealand? I was an assistant master in a Board primary school, then senior English master in a grammar school, and at the same time was head of the commercial department in a technical school. I went from there to Cambridge, and at the end of my course there was Lecturer in Physics and Chemistry at Emmanuel College, and Director of Studies in Physics and Chemistry. I was tutor in physics in connection with London University and the University Correspondence College. I have been connected with the Auckland Grammar School.

3. What are the subjects that you wish to bring before the Commission?—In the first place I want to emphasize one or two points in Mr. Mahon's evidence. One thing that he mentioned was the cost of education in England, which he gave as £15 per head, but he had not with him his authority for the statement. He has given me the report of the Consultative Committee on Higher Elementary Schools, published in 1906, in which it is shown that the gross cost of maintenance of the higher elementary schools and secondary schools, exclusive of sinking fund and interest on capital expenditure, was estimated by different witnesses at from £12, according to Mr. Lloyd, an Inspector, to £15 according to Dr. Garnett. Dr. Scott gave the amount at £14 4s. A later authority than this is that of the West Riding of Yorkshire County Council. In their instructions to authorities who were instituting secondary schools they issued suggestions which state that "the cost of maintenance, apart from establishment charges, may be put at from £14 to £16 per pupil per annum, this estimate also slightly decreasing as the number of pupils increases. The proportion of teachers to the number of pupils in the school ought to be at least as 1 is to 20." Those are the suggestions they enforce. If the local authority cannot come up to that standard they refuse their sanction, and will not give additional grants. Revenue is obtained in various ways—partly from Government grants, partly from endowments, partly from County Councils, and the rest has to come from local rates. To give some idea of what the local rating means I can only quote the case of the Borough of Keighley, West Riding, of which I happen to know Their local rate at the present time is 4d. in the pound on the annual value, for secondary education only. Primary education runs up to about 10d. It was 10d. some years ago, when I was at Home. The Keighley authorities were lately extending their institution, and, according to a report which I have lately received, they expected that when the extension was completed the rate for secondary education, which includes technical, would be 6d. in the pound. I understand that a question has also been raised as to the staff of the Wyggeston School, in which I was at one time a master. In my time the teachers numbered one to every twenty or twenty-one scholars. Since then there has been an increase, and there is now a class over twenty-five, but the other classes are much smaller. A question was raised as to whether the Wyggeston School was well endowed. So far as I know it is not. It used to be estimated that the total endowments were less than sufficient to pay the salary of the headmaster, about £1,000. I know that the school has the reputation of being heavily endowed, but in actual fact it is not so. In fact, when the Government brought pressure to bear to compel fulfilment of the regulations it became necessary for the County Council to take over the school. It has now ceased to be a privately endowed school, and is under the Leicester municipal authorities. A former colleague of mine, who is now headmaster of the Huddersfield Municipal Secondary School, has sent me particulars of the number of boys in the different classes. There is a preparatory division, and the school goes up to Form V, which corresponds with Form VI in the Auckland Grammar School. The numbers he gives are—Eighteen in the preparatory class; thirty-four in Form I; thirty-five in Form II—I gather that these two forms comprise boys of the same year, but in one form a little more advanced than the other; twenty in Form III; twenty in Form IV; and eleven in Form V. My friend added, "I am sending one of the old time-schedules. They [the Government] would not allow such large

forms now as I and II "—referring to the forms in which the numbers are thirty-four and thirty-five, which was about the strength of our lowest form in the secondary schools when I was in Leicester. Another point that was not touched upon by Mr. Mahon was that of the salaries of the lady teachers in New Zealand secondary schools. They are in a worse position than our own. One lady, after thirty years' service, is receiving £120 a year; another, after twenty years' service, £200; another, after sixteen years, £185. Other salaries are lower than that, going down to £150. With the exception of the first-mentioned, they hold the degree of M.A. of New Zealand University. One grievance of the lady teachers is that there does not seem to be any rational way of regulating promotions. One lady left the service at a salary of £150 a year after six years' service, and was immediately replaced by another mistress fresh from the University, with no teaching experience and no better degree, at £175. It does not tend to good feeling on the part of a staff when they know that they are working for less salaries, for instance, than those paid in the Normal School. The mistress there is getting £250, and the kindergarten mistress about the same. It does not seem to us that there ought to be that difference. One would think that the senior mistress in a secondary school ought to get at least the same salary as the mistress of the kindergarten school. I feel that the ladies are worse treated than the men. I would like to emphasize the point as to the size of the classes. I believe that that is the secret of any lack of efficiency there is in the present system. There are many little points that one would like to see remedied, but when you get down to bed-rock nearly all of them are explained by the fact that the classes are too large. To remedy that, I know, means increased expenditure. I do not see how the Government can hope to get things done more cheaply here than in England or Germany. That they get value for the expenditure I feel sure, after comparing the corresponding classes of boys. I teach exactly the same average number here as in Leicester, and I find that in a given time we covered approximately 50 per cent. more ground there than we do here, because our classes are so much larger and we take about three hours to do what we used to do at Home in two. The effect is that the boys do not cover the same amount of ground. The final effect is that the boys at Home, when leaving the school, are very much further advanced than the boys here. I have heard it suggested that that is due to specialization, but that is not so. There are classical schools at which they do specialize, but in the ordinary modern schools the boys come from the primary schools at an early age. Here, practically no boy comes till he is thirteen or fourteen. When I was leaving England six years ago they were discussing the question of giving no scholarship to any boy over twelve. That shows that the boys in England get on faster in the primary schools. One possible explanation is that at Home kindergarten schools are universal. The result is that the children begin their education at the age of three instead of five. Teachers say that there is an enormous difference between a child of five who has come even from the best home and the child who has come from a kindergarten. The syllabus at Home is almost the same as the syllabus here, but at Home boys take University scholarships between the ages of sixteen and seventeen. I think the same thing holds good in the primary schools, although I have not been in the primary schools at all. My explanation may be wrong. When I came here the physical-measurements course was almost identical with the course I had been teaching at Home, and no change has been made in the work I do. When I came I found the boys here covered a certain amount of ground in one term in twenty-four hours, and as the years have gone by the time required to cover that particular ground has gone up from twenty-four to forty-eight hours. They are the same boys, but there has been some change which I cannot account for, except it may be that possibly as the result of the introduction of the new syllabus in the primary schools, without making the corresponding changes necessary, the children have fallen behind because the teachers cannot get the time to teach them in the modern way. This year I have been astonished at the amount of time required to cover the same ground. The only other thing I wish to refer to is the teaching of science and kindred subjects in secondary schools, assuming, of course, that we could have this change of classes. I think it is possible to make an improvement in this matter. I do not think that at the present time science and the kindred subjects hold the position in the curriculum that they ought to do. We could divide the boys when they come into the school into two classes—those who will go to the university and those who will not. As to those who go on to the university, obviously their work must be governed by the science syllabus of the university. Those who take matriculation may not be influenced in the same way. Seeing that to gain a sholarship you have not to gain it in one subject, but in two, obviously the best thing for a boy who is not going to have a scholarship before him is to make him earn as many marks as you can. In that case, if one subject is undermarked and another subject is well marked, obviously the authorities will encourage a boy to take the highest marking. I think Latin and mathematics have 1,500 marks assigned to them, which is the highest. For science you can get 1,200 marks by taking two subjects; and for English 1,000, and French, I think, 1,000 marks. The point is that not only is science made subsidiary, but in order to cover the syllabus you have to put in an amount of time out of all proportion to the marks that can be gained. In fact, the ground cannot be properly covered. It would not be fair to take it out of the school-work. The method I adopt is, instead of taking two sciences, to teach a part of two. That means a pupil is handicapped before he goes in. The tendency, therefore, is to encourage schools where they have no very strong opinions to substitute other subjects. I am not referring to our school, because that is not the case. We substitute the maximum: we take two sciences in the lower forms when we need only take one. But the tendency in other schools is to take the subjects which will pay better, and it produces a one-sided curriculum which is almost entirely literary. Out of twenty-five hours in the week in our school fifteen or sixteen are devoted to literary subjects—classics, English and modern languages, and so on, and I think there are only about ten given to mathematics and science. Again, mathematics, as a result of the syllabus, is more or less a theoretical subject, so that you only get one-fifth of the time devoted to what can be called real scientific practical modern work. I am not depreciating

classics, because I know that classics can produce some marvellous results. I say a classical training is an excellent one, but you have to do it properly. Those boys who do classics properly start at the age of eight or ten years at the outside. They do Latin and Greek compulsorily, and they study with it the literature of these languages. The result is that they know some classics when they are done. The question is whether it is worth while for the University of New Zealand to encourage the taking-up of Latin and literary subjects when you are starting with boys at the age of thirteen or fourteen and know that they will finish at the age of twenty-two. That is where I doubt the wisdom of the practice. I think, at the same time, science as we teach it yet is not as it ought to be. It should be associated with workshops. There should be in every school, along with the science, practical workshop practice, not devoted to teaching to draw or anything of the kind, but merely to developing the powers of the boys. I do not think there is anything like it. If you correlate mathematics and science with the workshop with sufficient literary subjects I believe you will get the best results.

4. *Mr. Davidson.*] In England does the State provide free secondary education?—No. They take a very strong stand on that, and will not give Government grants to any school that does not charge a fee. They mention as the minimum fee that ought to be charged £3 per year. At the same time, to meet the case of poor people it is within the powers of the governing body to give a number of bursaries providing free education and the necessary maintenance allowances, providing that these do not reach above a certain proportion of the whole.

5. Then, the pupils taught by you were not drawn from the ordinary Board school?—Yes, they were—at least, the ones I happen to be basing my statements on were.

6. And these pupils were the very best from the primary schools?—Yes.

7. Here you will have boys who have simply obtained free places?—Yes.

8. Or passed the proficiency examination?—Yes.

9. So it is scarcely fair to compare the average boy taught by you here with the boys taught by you in England?—I am not doing that. You see, the class of boys that comes more immediately under me is a class composed two-thirds of National Scholarship holders and Education Board scholars. I have carefully left out of my reckoning the other boys.

10. Do you think that the course in physical measurements laid down in the primary-school syllabus should be taught to the upper standards in our primary schools?—I should hardly care to express an opinion on that.

11. Are you aware that the work laid down in elementary physical measurements in the present primary-school syllabus is not done in the primary schools in Auckland?—It does not concern me at all.

12. If that work were done in the upper standards of the primary schools in Auckland as it is done in these standards in other districts in New Zealand, do you think that would have a marked effect on the preparation of boys for your work?—I should not like to see it done, because I think there is no subject so difficult to teach as science, and unless you get experts in the primary schools I do not think the work would be well done. I would rather receive boys who know nothing than boys who had done some work in a primary school.

13. You say that the secret of any lack of efficiency in the secondary schools is attributable to the fact that the classes are too large?—Yes.

14. Do you think if the secondary schools were under the same control as the primary schools that would lead to a better co-ordination of work and to a better staffing probably of the secondary schools?—It is not necessary. It may lead to it. I think some arrangement between the teachers, too, and these bodies might bring that about without having to make a change.

15. Do you not think we are more likely to have a uniform scale of salaries and a high rate of salary if primary, secondary, and technical education were under the one governing body?—From the point of view of salaries, yes; but I was talking of the efficiency of the teacher.

16. *Mr. Kirk.*] Can you give us an idea of the size of the classes in the primary schools in the Old Country?—When I left about six years ago the average size was about fifty. Since that time the Department has stepped in and has insisted that the classes shall not be more than forty. To do this they have to face an expenditure of something like £30,000,000 in the next five years.

17. Do you think if that system were introduced here it would really tend to greater efficiency?—I do not think there can be any doubt about it. I suppose you will have to increase the number of schools or increase the size of the buildings. It brings you up against another question altogether. I think there is a certain minimum size which might with advantage almost be the maximum size. As soon as you come up to a certain size you have reached a maximum of efficiency, and I do not think it pays from the point of view of efficiency to increase it. I would say you could with advantage diminish schools of from 600 to 1,000; but it does not matter when you come to schools of ten or twenty, because you cannot get efficiency there.

18. Is it fair to compare a young country like New Zealand with an old settled country like England?—No; but I was trying to give you the ideal, and the question was, are we getting value for the money? My opinion is largely this: I think we made a mistake at the beginning in trying to take up the free education that we have done. It seems to me rather like a man starting business with too little capital. Now, the question is, what are we going to do? Will you retrench this education or raise some more money and carry it on? I think that, while you are getting as much value for the money spent as you can get, you are not getting as much value as you would if you doubled the amount of money spent. I think you would then get ten times the value that you do now.

19. What are the sizes of the classes at Eton?—They are pretty big, but there is no comparison. The aim of the education authorities here is not at all the aim of the Eton authorities. They get education at Eton outside the class-rooms; they look on the inside work as comparatively unimportant. These remarks would apply to all the large English schools. There is the same difference as between an Oxford and Cambridge B.A. degree and a New Zealand degree.

20. You speak about children entering school at an earlier age: what have you to say in regard to the statement of doctors that children should not attend school until they reach the age of eight years?—It depends on the school. I have never heard any doctor oppose a kindergarten. The children are better there than at home: it is an ideal home.

21. You believe in children entering kindergarten schools?—Certainly.

22. At what age do you think they should leave the kindergarten for the primary school?—The primary at Home does not differ very greatly from the kindergarten—it is merely a changed kindergarten, so they really do not leave it so far as their studies go, but they leave it so far as the Government classification is concerned at the age of five.

23. So that at Home children enter upon our primary-school system at the age of five?—Yes.

24. Has that been pernicious or otherwise here or at Home?—The result of going at the age of three is that they have been, so to speak, in an ideal home where their faculties have been developed, so that so far as development goes they are really seven years of age when they enter the primary school at five years of age.

25. Has it had any detrimental effect on the health of the children?—Very much to the contrary. The classes are small—only six to twelve—and the rooms are beautiful and as comfortable as a nursery.

26. *Mr. Wells.*] You made a comparison between the salaries paid to some lady teachers at the Grammar School and the salaries paid to teachers at the Normal School: I suppose you know that the teachers at the Normal School are called upon to do very special work in assisting to train young teachers?—I did not wish to convey the idea that I was depreciating the teaching at the Normal School.

27. Do you not think the work of training people who are going to teach numbers of children in their time is specially important?—Yes, but not more specially important than the work of a senior lady teacher at the Grammar School. I should look upon them as experts.

28. And they should be paid as experts?—Certainly.

29. Do I understand you would strike out all science teaching from the primary schools?—All systematic science work.

30. You know a good many pupils go to work after leaving the primary schools and do not go to a secondary school?—Yes.

31. Do you not think it is an advantage that they should have a beginning, as it were, in scientific work?—I would replace that by object-lessons.

32. Scientific method would be needed in object-teaching?—Yes, in a way, but it is not quite the same.

33. Do you know that in some of the large town schools the numbers in the Fifth and Sixth Standards run up to sixty and seventy?—I understand they go higher still.

34. Do you not think that fact would account for a great deal?—I said I thought it was the cause.

35. In regard to the slackness you have noticed in this year's boys: I suppose you find, as most teachers find, that there are fat and lean years in regard to ability?—Yes, but the point that struck me was the gradual change.

36. Can you express any opinion as to the work done in English and arithmetic by the boys who come to you?—Five or six years ago I should have said the arithmetic was good, but since then it seems to me it is not so good. The same falling-off has occurred in writing and character of composition, and so on.

37. *Mr. Hogben.*] Is it not true that in the last five years you have raised the standard you require of the efficiency of the experiments?—No, I do not think it is.

38. Are you not requiring in the class a higher standard of accomplishment in the experiments before you pass it now?—I should think it was the opposite.

39. Did you not go a little carefully at first because you had different boys to deal with, and therefore you did not require too severe a test?—I do not think so.

40. Are you aware that five or six years ago the only boys admitted to free places at Auckland were boys who had passed the Department's examination for free places?—Of course, I came here at that time, and only took the boys as I found them.

41. Now you take all the proficiency boys?—Yes; but my argument is based on the same class of boys, as I have already pointed out.

42. You seem to think there ought to be no science taught in primary schools: by that I suppose you mean the organized body of knowledge that is worthy of being called a separate science?—Yes, I ought to have called it a science course.

43. Do you not think if physical measurements were taught in the upper standards of the primary schools in the very simplest form it would help the arithmetic, and would help you afterwards with your science work?—If you take mensuration as the first part of physical measurements I might be tempted to agree.

44. Do you not think it is a good thing to keep the observation of the children trained from the earliest years?—I think it is.

45. *The Chairman.*] I understand you to emphasize the value of the kindergarten as the first step in the education ladder?—Yes.

46. And that the general tendency is to take a child from four to six years and keep him in the kindergarten course?—Three to five years.

47. Do you know as a fact that the result of kindergarten instruction is to allow a child on passing through the primary course to forge ahead considerably of ordinary pupils?—I do not know that personally, but that is what friends have told me. I do not think there is much doubt about it.

EDWARD CORRIGILL BANKS examined on oath. (No. 28.)

1. *The Chairman.*] What are you?—I have been a farmer at Matamata for the last eight years. I have been Chairman of the Matamata School Committee for the last six years, and before that I was in the Head Office of the Education Department. I have been a member of the Education Board one year. I wish to speak in regard to the division of districts, the school syllabus, teachers' training, and country schools. With regard to the division of the education district and the districts of the Dominion as a whole, I think that three of the districts in the South Island could be done away with, because they are too small. I refer to Marlborough, Grey, and Westland. Each of these districts is only about as big as one of the largest schools. I think that the Auckland District is too big altogether, and I think it should be divided at Mercer. At the present time on the other side of Mercer we have three members of the Board—two living at Hamilton, and myself, half-way between Mercer and Rotorua. There is no member on the gold-fields, at Bay of Plenty, in the King-country, or at Raglan. These districts might just as well be controlled from Wellington as from Auckland. My idea is to divide the Auckland District at Mercer. It would then have something like 26,000 or 28,000 children, and would still be the largest district in New Zealand. The South Auckland District would then have something like 12,000 or 14,000 children, and would be about the fifth-largest education district in New Zealand; and instead of the three men living in that district we should have nine members, representing Opotiki, Tauranga, Waihi, Thames, Cambridge, Rotorua, Raglan, Taumarunui, and Te Kuiti. The headquarters would be at Hamilton. With regard to the school syllabus, speaking as a farmer, I simply wish to refer to the young fellows who come to me. I am a farmer in a big way. Young men come to work on the farm who have been through the Sixth Standard, and it is remarkable to me the ignorance these young men display. They have no practical knowledge. They cannot estimate the acreage of a field or tell me how many gallons of water there is in a tank. This is an agricultural country, and it is becoming more so every year, and we have to form our syllabus so as to meet that fact. If I ask a young fellow anything about plant-germination he knows nothing about it. I certainly think our pupils should know something about the history of New Zealand, and they should certainly know something about the geography of New Zealand, and especially the physical geography. In regard to teachers' training, I brought up the following remit at the Farmers' Conference at Auckland: "That the Government be asked to arrange that all male students attending teachers' training colleges have six months' education on a Government farm." In support of this remit I said: During the thirteen years that Mr. Hogben has been Inspector-General of Schools he has made an honest attempt to make our education system more practical, and in this he has been backed up by Mr. Seddon and other Ministers of the day, and we are now, in addition to having increased the salaries of teachers, paying away some £100,000 a year for manual and technical instruction in public and high schools more than we were thirteen years ago. This is a very large expenditure, and though there are some results, yet they are not what they ought to be in comparison with the amount of money spent. The reason that there are such poor results is the conservatism of the older teachers. When they were in their teens they were taught to teach everything from the book, and the majority of them cannot tear themselves away from the old methods and make their teaching more interesting and effective by teaching the children plant-life in the school-garden, animal physiology with the cow and the horse in front of the class, and practical arithmetic by giving the boy rule and measure and making him find out for himself by actual measurement and calculation the amount of water the school tank will hold or the area of a three-sided portion of the playground. The older a teacher is the harder it is for him to assimilate this newer and better method of education, and I think that it would be better if, instead of spending money on him, the young teacher were taken in hand when he is in his teens and given six months' practical education on a Government farm. It may be said that a Government farm is too expensive a place for a man to receive his education on, but a gradual decrease has been brought about of late years under the management of Mr. Clifton, Mr. Drysdale, and others, and I was pleased the other day to see from a statement of the Hon. Thomas Mackenzie that the Government farms are now paying their way. At Ruakura a large building was finished a year ago for the accommodation of students, and it has not yet been occupied. At Weraroa the Government is proceeding to erect accommodation, and at Lincoln there is the Agricultural College. This institution has now been at work some forty years, and has always been fortunate in its directors and teachers, but the results have not been as great as they should have been, the reason being that the students are mostly rich men's sons, and rich men's sons, as a class, are lazy. It would be far better for the Lincoln Agricultural College if half the College were reserved for the students at present attending our teachers' training colleges. The teacher student, knowing that he has to work for a living, will take keen interest in the work of the College, and will assimilate to the full the practical lectures given by the masters in botany, mechanics, veterinary surgery, general farm work, &c., and when he leaves the institution will be equipped for the rest of his life for the teaching of our children in the public schools in a practical way. I may say that in Australia the Government is already doing this good work at Hawkesbury College, and several men from that College have received appointments in the southern production districts of New Zealand as teachers of agriculture at salaries of from £300 to £400 a year. This being the case, I think that it is high time we proceeded on the same lines in New Zealand as is done in the Hawkesbury College in Australia. If our teachers are educated on the lines indicated, there is reason to hope that our sons who will be the farmers of the future will receive such an education that they will make better farmers than ourselves, and this should be the hope of every father. With regard to small schools for country districts, when I became a member of the Board I found that it was the general practice to wait till there were more than twenty children of school age

in a district, and then apply for some £300 for the building of a school. I thought that that was rather rough upon districts where there were ten or fifteen children without education, and I brought the matter before the Board. We resolved that with respect to districts where there were more than ten children we would apply for a smaller grant. In one or two instances we have applied for £70 or £80 for what we call a "shelter-shed" school. That system is not yet well known, and the people in the backblocks are still being asked to put up their own schools. When I came through Kaimai, near Whangarei, the other day, I found that the settlers in the district, mostly poor men, had subscribed £17 for the building of a school, which is as much to them as many hundreds of pounds amongst business men. That should not be allowed—we should not take advantage of the willing men in the country. I consider that wherever there are more than ten children in a district without education the Department should give the Board £100 to do their best with in that district.

2. *Mr. Pirani.*] Do you think it would conduce to better education if one Board controlled the primary, secondary, and technical education in the whole district?—I do not know. The personnel of the Boards is not good enough for that. If you had better-educated men on the Boards they could do it.

3. Do you not think the personnel would improve if the responsibility were greater?—Probably it would.

4. Would you favour the election of the Boards on the parliamentary franchise?—No. I would leave it to the School Committees. If it could be done I would let the teachers have a say too.

5. Do you know of any other instance where those who are in the position of employers are appointed to that position by the employees?—I cannot think of any.

6. *Mr. Wells.*] Can you say how many of the Grade 10 schools of 600 and over there would be in the proposed South Auckland District?—Not offhand, but there would probably be seventeen out of the fifty biggest schools. The district would include large and growing towns like Hamilton, Te Kuiti, and Cambridge, and there are big schools at the Thames, Rotorua, Tauranga, and Opotiki.

7. Have you had much complaint from the out-districts?—I have heard a great deal of complaint from the King-country and the Bay of Plenty district. Those districts have no representation, and the Board is of no use to them.

8. Are not the men of whom you have spoken grown up?—Twenty years of age, a lot of them.

9. Men who probably left school at fourteen, and have never done anything in the way of study since?—No, and they have forgotten all their book-knowledge.

10. Do you not think there is a shocking waste in boys leaving school at fourteen and dropping their education at that stage?—They should at least go on in the primary schools till they are fifteen, and get a better grounding, especially in practical arithmetic, plant-life, and animal-life.

11. Could not that be done in continuation schools?—If a man or a boy does eight hours' work in the country he is not very keen for evening study.

12. Could they not do it in the afternoon?—It would be a very good thing.

13. From your knowledge of the work of the Department and your experience as a farmer, can you offer any suggestion as to the way in which we could get greater economy or greater efficiency in the system?—Not beyond the suggestion I have thrown out as to grants for small country schools.

14. *Mr. Kirk.*] I think Mr. Hogben, in one of his reports, has recommended the formation of classes in the country for young men, where they would have an opportunity of reading up special subjects. Has any attempt been made in your district to form such classes?—No. It would be a good thing to have them. If veterinary surgeons could come along, say, once a week, to instruct young farmers it would be a splendid thing.

15. Do you know that the Government either now send round, or propose to send round, Instructors to the farmers in certain agricultural branches? Would not that largely meet the case?—It will help to meet the case; but where you want to begin is at the student in his teens. You want to teach him more about agriculture. We are importing men from the college in Australia. Why is that kind of work not done at Lincoln College?

16. Do you not think that a knowledge of the history of our own Empire, and the history of the great men of the world, would tend to make our agriculturists better citizens?—It would be very well in a school reader, but it should not take precedence of a knowledge of plant-life and animal physiology, which they have to deal with every day. It is all very well for recreation. I would like to see our boys know more about Captain Cook and Sir George Grey than of such matters as William the Conqueror. I would sooner see our own history taught than English history.

17. Do you not think that the agriculturists, who will have a large representation in Parliament, could exercise their political powers more effectively if they knew something of Roman history?—It is of no practical use to them. Ninety-nine per cent. of them are not going to Parliament.

18. Then, your opinion is that history does not stand high as a factor in education?—I like it for recreation, but there is not much time for it in the public schools. If we teach history it should be about New Zealand.

19. Do you then, as an agriculturist, stand for a purely utilitarian system? Do you think the purely utilitarian man will make the best citizen?—I would not be so emphatic as that. What I have mentioned should be compulsory subjects in the syllabus, and history and the geography of other countries should be only optional. I would make the history and geography of New Zealand compulsory.

20. In view of the pushing-on of the railway-line on the east coast, from Gisborne to Tauranga, did you, when thinking of the cutting-up of the Auckland District, look ahead to the time when perhaps Gisborne might be the centre having charge of the Tauranga, Opotiki, and east coast districts?—I have not thought of that. Under the present railway policy it will take thirty years to complete that line. It ought to be done in ten. I think there is a good deal in what you suggest. If the railway were constructed in a reasonable way it would be a very good thing to have the Bay of Plenty and Gisborne in the one education district.

21. *Mr. Davidson.*] Are you in favour of the present method of appointing teachers in this district?—I am.

22. If the unnecessary small schools in districts where the roads are good were centralized, would you favour the spending of money in such districts?—At Matamata we tried to get the Turangamoana people to send their children by a good road to the Mangawhero School, but some of the people would not have it. The erection of a school in a district increases the value of the land in the district, and the man who is milking wants his boy both morning and evening. The people in such districts will not have centralization.

23. If they could be educated up to seeing that they would have increased efficiency if the unnecessary schools were closed, would you be in favour of spending the money so saved in the direction of helping the people in the backblocks?—I would.

24. *Mr. Pirani.*] Do you know that the *School Journal* teaches exactly what you say ought to be taught in the shape of current history? I have a copy before me which deals with the South Pole, the Delhi Durbar, the current history of China, the doings of the New Zealand Parliament, and the life of prominent New Zealand men?—That is what we want.

25. So that all the time the Department has been doing what you say it ought to do, in connection with the *School Journal?*—Yes.

26. You favour giving the teachers a voice in the election of Boards. If the elections were carried out under the parliamentary franchise, with a system of proportional representation, does it not follow that the teacher, as a citizen, would be able to exercise his rights, and therefore influence the election of a better class of men?—The teachers would have very little influence under the general franchise, but if each teacher had a vote as well as the Committee he would have more influence.

27. Would not that be purely sectional representation?—We have universal representation in Parliament at present, and I do not think it is a good thing.

28. Would not the application of the principle of co-option strengthen the personnel of the Boards materially?—As to getting the services of men experienced in education, it is certain that if an Inspector who had spent the best part of his life in the Auckland District retired at sixty and had still good work in him, he would be elected by the School Committees and teachers.

29. As an ex-clerk of the Education Department, can you suggest any means by which the returns required by the Department could be simplified?—I think they are a good lot of returns, and they are wanted for general information.

CHRISTOPHER JAMES PARR examined on oath. (No. 29.)

1. *The Chairman.*] On what matters contained in the order of reference do you desire to address the Commission?—In the first place, with regard to the question of the administration of education, more particularly primary education, I consider that the present system of Boards and Committees is as satisfactory a system as the Dominion is likely to get. It is much more easy to criticize the system than to suggest a means for its betterment. As to the areas covered by the Boards, undoubtedly the smaller Boards should be amalgamated, in the interests of efficiency of administration, and more particularly in the interests of the teachers. When I was a member of the Auckland Education Board I came to the conclusion that three Boards could satisfactorily serve each Island of New Zealand—certainly not more than four. The Auckland District may be a little too large, though I would not lay much stress upon that aspect of the matter. I believe that any large business, provided that you get competent executive officers, can be much more efficiently and economically managed than a comparatively small business. The same principle applies to the administration of education. A great deal depends upon your executive officers. A large district may be just as well managed as a small one, if not better, provided you have competent officers in the Secretary, Architect, and Inspectors. The Inspectors move about among the Committees, and if they are the right class of men they keep the teachers and the Committees in touch with headquarters. I consider that the Chairman of a Board ought to be paid a salary. When I was Chairman of the Auckland Board the work in connection with the office took up quite half my time. I do not see how the Chairman of a large district can do his duty unless he gives up half his time. The Chairman should travel about a good deal, and get more in touch with the Committees than is usually the case. I found that 99 per cent. of the little differences that arose were smoothed away at once by a visit from the Chairman and, say, a couple of members of the Board to the district. Very often in ten minutes matters that had exhausted reams of foolscap in correspondence were settled to the satisfaction of all parties. Certainly the Chairman, and possibly the Board members, should get about amongst the Committees more than they do at present in most districts. I should like to emphasize the need for better playground facilities for the children in the Auckland City schools. I think there is the same lack of playing-grounds in Wellington, and I have some recollection of seeing some rather limited playgrounds in Dunedin. If the State compels a child to go to school it is the duty of the State to provide that child with proper open-air playing facilities, so that he may grow up a healthy and strong individual. I need hardly say that the strength of a nation is the physical strength of its people. I do not think it is fair that we should ask six or seven hundred children in a city like Auckland to play on half an acre of asphalt. This is one matter in which the administration of education in this country

have been exceedingly shortsighted. The requisite land is available. No doubt I shall be met with the remark, "Oh, the land in the localities where you would want it is worth £10, £15, £20, or £30 a foot, almost a prohibitive value." I do not agree with that view. I think the most valuable site is not so valuable as the health and ultimate well-being of our young people. I suggest that a special effort should be made by the Legislature and the local bodies of New Zealand to enlarge the playing-places attached to our big city schools. That would be one of the best investments that public money could be put into. I suggest that in a place like Auckland the city and the suburban boroughs ought to do their duty in the matter. In such cases the local body ought to contribute, because it would get what is really a park for the young people. I have already suggested that something of that kind should be done with regard to one or two of the local schools. As to the grading of teachers, I hold that you cannot get a satisfactory system of promotion unless the teachers are graded, as is done by the Auckland and Wanganui Boards. I think the Wanganui Board adopted that system first, though we had been discussing it earlier than they had. It was adopted by the Auckland Board during my chairmanship, and I think it was the best thing done in my three years' term of office. I know that under it the teachers have been much better satisfied with their conditions than previously. Of course, there are individual teachers who object to it, but I have generally found that the dissentients are the less efficient people in their profession. I feel that the principle of grading on some plan should be extended to every education district, in the interests of fair-play to the teachers. I approve entirely of the direction of the present legislation with regard to the appointment of teachers. I hold strongly that the Inspectors should grade all the teachers, and that promotion upon that grading is the only satisfactory solution of the problem. I do not approve of the School Committees having the right to select teachers for the schools. I have great respect for the average School Committee. It is a very useful institution, and does a great deal of good work, notwithstanding the tendency nowadays to disparage School Committees; but I am unable to accede to the suggestion that a Committee has any real capacity for the work of selecting the teachers. The men who know the teachers best are the men who have to examine their work—the Inspectors. The Auckland Board was content to give away the patronage that had previously belonged to Boards, in order to carry out what they believed to be the system fairest to the teachers. The Committees and the public ought to recognize that more than they do. In my time I found that there was a less amount of objection to the change on the part of the Committees when once they got into the swing of the new system. What objections there were were isolated, and could not be substantiated when they came to be examined. I doubt if there is to-day any real objection by the Committees to the Board sending in to them the name of only one candidate. All the trouble on the question is being raised by a very few gentlemen who are sorry to have lost the patronage they exercised under the old system. I am quite satisfied that the plan of promotion by grading, the Board taking the name of the highest-graded teacher and submitting that, and appointing that person in default of reasonable objection, is the most equitable system. Before it came into operation here at least 30 per cent. of the appointments that were made went to the wrong man—not to the man who deserved the appointment, but to the man who was the best canvasser or whose friends canvassed on his behalf. That meant that thirty out of a hundred teachers suffered grievous wrong. We tried the four-name system, but found that almost as a rule the fourth man on the list got the appointment. The system of local control in education matters is immeasurably superior to the Australian system of bureaucratic control from headquarters. In New South Wales a gentleman in Sydney appoints the head teacher of a school five hundred miles away, or removes a teacher from a school six hundred miles away. We should adhere to the principle of local control by Boards and Committees, with certain amendments that might be suggested. As to the syllabus, the conclusion I formed when in office was that the syllabus, if put into the hands of an expert teacher, is a great improvement upon the syllabus that previously obtained, but you must have a teacher of some experience—a teacher who is something more than a mere drudge. He must be an educationist. Our difficulty in my time was that we had so many uncertificated teachers—positively weak, untrained teachers, particularly in the country districts. I felt that in the hands of these people the syllabus was rather a mistake. That kind of teacher requires to have his work cut out and laid before him, and unfortunately we have to put up with him, because you cannot get anything better. We attempted to remedy the difficulty by appointing another Inspector, who is called an advising teacher, and I think that man has done excellent work among the weak teachers. He explains to them the syllabus, and suggests to them a course of work, and that has been to the benefit of both teachers and pupils. But get the right kind of teacher and the syllabus is all right. While we are extending the system we must not forget the fundamentals. I am inclined to think we have gone a little off the track in that respect. Some of the subjects, I think, are not taught as well as they were, though others are taught much better. Writing, when I was on the Board, was considered to be better than it had been. The reading, certainly, was better than when I was a scholar in the primary schools, and very much better than it was twenty-five or thirty years ago. With regard to writing, when I say it is better nowadays than it formerly was, I speak as an employer who has to deal with boys who come from the primary schools. I doubt whether there is quite the same accuracy in arithmetic—I refer to the mere drudgery of arithmetic. I do not think the children are as accurate in long additions as they were. I grant, on the other hand, that their reasoning faculties are better developed, but I regret the falling-off in accuracy. That there is that falling-off I am pretty clear. With regard to geography, the physical side of it is very much better taught than it was. As to political and commercial geography I am not so sure. When I was on the Board we considered that it was rather neglected, and took steps for its improvement, and I believe we have pulled it up in this district considerably. History, too, was absolutely neglected at one time. I do not blame the syllabus for that, but the Inspectors who are charged with the interpretation of the syllabus. I think that, on the whole, the syllabus, if rightly interpreted and put into the hands of competent teachers, is undoubtedly on the right lines for bringing about the best results.

2. *Mr. Pirani.*] Do you think it would be an improvement to have the primary, secondary, and technical education of a district under one control—with sub-committees, of course?—I think so, on the whole. In a large city I think the Education Board should encourage the formation of a controlling Committee, in order to stimulate public interest.

3. *Mr. Wells.*] What is your opinion as to the advisability of giving the local body power to levy a rate for the upkeep of the school, such rate to be subsidized?—I am very chary of giving the Legislature an excuse for putting the cost of education on to the local rates.

4. I do not mean as to salaries, but simply the maintenance of the school and the maintenance of the school-grounds?—I would not even go as far as that. It would be opening the door. I think the Consolidated Fund should bear those charges, otherwise you would get one district laying itself out to do the thing really well, and another, perhaps a poorer district, neglecting education altogether.

5. Would it not provoke a spirit of emulation?—I do not think you could screw the ratepayers up to much emulation.

6. Is there not a great waste through children suspending the education when they leave the primary schools? Have you thought about the establishment of continuation schools?—The matter came before the Board in my time, and we were in favour of the system of continuation schools. I thought it was really a crying need at the time.

7. Do you think public opinion is ripe for making attendance at such schools compulsory?—I do.

8. *Mr. Kirk.*] Assuming that a Dominion system of promotion were in operation, and that for a vacany there were, say, three applicants of equal standing on the promotion list: would there be any harm in sending all three names to the Committee, and allowing them to make the final choice?—Not the least, if the candidates were equal.

9. Would you favour such an extension?—I do not see any objection to it.

10. Have you had an opportunity of judging as to the results of teaching in school vocational subjects, such as shorthand and typewriting?—I think so. In my office we employ eight lads who came from the Grammar School after having been through the primary schools, and also two typists who have had primary education only.

11. One gentleman has given us his opinion as to the value of the education system as it affects the lives of the young people of the country. Will you give us yours as to its effects upon boys in town?—I have already said that I consider some subjects are much better taught than they were. I see the result of that in the young people I have to do with.

12. Do you think that as a result the boy is better qualified than the boy of fifteen or twenty years ago?—I doubt if he is. I do not think the literary side is so well looked after as it was, but if you are going to make your boy a blacksmith or a carpenter I do not know that he is not better turned out now.

13. Is there time in the school to teach such subjects as shorthand and typewriting?—I do not think they ought to be taught.

14. *Mr. Davidson.*] Do you think teachers should have the opportunity of securing positions in any part of the Dominion?—Yes.

15. Do you favour, then, a Dominion promotion scheme, such as that advocated by Mr. Mulgan?—There would be many advantages in such a scheme if it could be managed, but the difficulties are manifest. You will have Inspectors with different standards of judgment, and you will not have the same group of Inspectors dealing with the same body of teachers.

16. But is not such a system in operation in the Australian States?—I do not think the difficulties are considerable, but there are some.

17. If they could be surmounted would you recommend the principle strongly?—Yes. You will not get satisfaction from the teachers until you have something of the kind.

18. Do you think the Inspectors should be under the Central Department?—I am not prepared to say.

19. If that were done would not the bringing into operation of a Dominion promotion scheme be simplified?—Very much.

20. Suppose the Inspectors were placed under the Central Department, would it not be a good thing to have for each education district an officer who might be called the Superintendent of Education, to do what you say you think the Chairman of the Board ought to do—move about the district, and be an adviser to the Board?—I felt very often, when Chairman, that there was a need for a functionary of that kind in this large district.

21. You spoke of organizing teachers: are there many such teachers employed in the Auckland Education District?—I think there are two.

22. Would it not be a good plan to have as your relieving teachers specially qualified men who could act as organizing teachers?—No doubt there is a good deal in that.

23. *Mr. Hogben.*] Are there typewriting and shorthand classes in any primary or secondary school that you know of?—I think there are in the Grammar School—on its commercial side.

24. Do you see any objection to shaping the education of boys and girls so that they shall receive a general training in connection with the subjects that will have a bearing upon their future careers?—I do not see any objection to that, but you must be careful not to begin that sort of thing too early. The child must first be able to read, write, and spell. When a child is unable to spell two-syllable words correctly I do not know about the value of training him with a view to his future.

25. Is it inconsistent with the teaching of reading, writing, and arithmetic that the subject-matter of his education should have reference to his future life?—Not at all.

26. *The Chairman.*] Are we all agreed that the pupils who come to you professing a knowledge of shorthand and typewriting are the products of the secondary schools? Is your experience of such persons that they are not as well grounded in composition and spelling as they ought to

be if they are typists?—I do not know that most of these young people have received their technical training in the schools. I am inclined to think they got it from private teachers. I have had no experience of typists trained at the Technical School. A good deal more than half of the typists and shorthand-writers are turned out from the private schools, which take children who have been through the primary schools.

27. What is your estimate of the instruction they give in these special subjects?—I think they are rather weak at times.

28. Assuming that the Consolidated Fund is charged with the cost of supplying all schools and equipping them, and that it is required to make an addition to a school, or provide it with new playgrounds, or erect new conveniences, is not that a fair charge to put on the local rates, provided that the State gives a subsidy?—I see no objection to giving the local body power to levy a rate for such a purpose, but I would not make it compulsory.

29. As a matter of fact, is there not a good deal of local effort now? Do not the people tax themselves to provide all sorts of things for the schools, the proceeds of which are subsidized by the Board of the district? Would it not be an advantage in respect of these purposes if the locality, supplemented by a liberal subsidy from the Government, took these matters into its charge?—I have said, with regard to providing recreation-grounds for the city schools, that it would be a fair thing for the local bodies to contribute.

30. Take the case of one of your city schools: is there not a project to provide a new playground?—Could not it be got by the City Council, the Education Board, and the Department agreeing to contribute equally to the cost of purchasing the necessary ground?—I have already suggested that, and it is before the Education Board now.

31. Is not the same principle good with regard to other matters? Does it not encourage local effort?—I see grave objections to shifting the responsibility for the maintenance of schools on to the local rates.

32. But I am not speaking about the maintenance of schools. I have excepted new schools?—What precisely would the rate be for?

33. For the hundred-and-one things that have to be done during the year?—I would like to know what they are before answering.

34. In one school that I am interested in a swimming-bath has been provided by local effort, and we are asking the City Council to supply water free? Is not that a proper thing?—If the citizens are willing to help, let them, by all means.

35. Are you, as Mayor of Auckland, prepared to recommend the citizens to provide a sum of money to secure the playground you have referred to?—The area as to which a proposal is before the Board now is one at Ponsonby, several acres in extent, which is quite separated from the schools, though close to them. It would make a first-rate football and cricket ground for the boys. I suggest that it should be acquired as being central for three schools, as a playground. In that case I see no objection to the City Council helping. I think they ought to.

36. But not in the other case where they have no playground at all, and propose to acquire certain properties for the purpose? Is not that even more pressing?—I must consider each case on its merits before I can agree to it. I am not going to favour a proposition which might mean that every local body in the country might be called upon to increase the playing-grounds for the schools. That is the business of the Legislature.

37. Do you favour the creation of a national Council of Education, to control all phases of education in New Zealand?—I think something in the nature of a council of experts would be a step in the right direction.

MARTHA WASHINGTON MYERS examined on oath. (No. 30.)

1. *The Chairman.*] What are your position and qualifications?—I am the wife of Mr. Leo Myers, a citizen of Auckland. I am a graduate of the high schools of San Francisco, and took a two-years course at the University of Berkeley, California. My interest in education has been entirely non-professional.

2. What part have you taken in education matters in New Zealand?—My interest in education here has been confined to the free kindergarten movement, which I was instrumental in founding in Auckland. The movement was not properly understood until we worked it through the private kindergarten system. About ten years ago we started a private kindergarten in Remuera. It was well attended, and then the parents of the scholars began to realize the effect of the Froebel principle of education. After we had got a second private kindergarten established, we decided to try again with the opening of a free kindergarten. On securing a capitation grant from the Government we sent away to the Old Country for a teacher, and Miss Gibson was appointed two and a half years ago. Through the generous gift of Sir J. Logan Campbell we were able to equip the Campbell Kindergarten, erected on land at Freeman's Bay given to us by the Auckland Harbour Board. Our principal difficulty has been that of training teachers—getting the girls to train—but we have surmounted that, and each year the movement is growing stronger and meeting with more public support. The Campbell Kindergarten now has an average attendance of about forty-five, and there are three assistant teachers, who give their services in the mornings in return for the practical training, and in the afternoon attend lectures given by Miss Gibson on the theory of the system. The Auckland Kindergarten Association has under it the Campbell Kindergarten in Freeman's Bay, besides private kindergartens at Remuera and Epsom; and yesterday a second free kindergarten was opened at Newmarket. As with most charitable organizations, we have a difficulty in the matter of funds. The Government grant helps us to the extent of about half our expenditure; the rest is made up by voluntary subscription. Those interested in the movement consider that the free kindergarten system should form part of the education system of the country—that there should be a free kindergarten in every

primary school in the Dominion. Of course, it is a question of finance, but as I believe we pay more *per capita* for education than any other country in the world it ought to be possible. After years of sympathetic work in America and New Zealand as a non-professional, but as a mother and a woman keenly interested in all matters bearing upon social betterment, I do most heartily recommend the establishment of kindergartens in every public school in the Dominion. The few free kindergartens at present in existence merely serve as searchlights that throw into bold relief thousands of dull, neglected children—children of idle, dissolute, or irresponsible parents; children, too, from comfortable homes who are being wrongly developed. Place them in kindergartens during their most impressionable years (from four to seven) in an environment which nurtures what is best in their moral and mental health by occupations suited to their natural unfolding, and you are building up a solid asset for the nation—the forming, from the beginning, of good citizens. Kindergartens stand for formation, and obviate the necessity for reformation. Children passing from kindergartens into public schools assure that continuity so essential to all-round practical education. The present existence of free kindergartens, supported partly by Government grant and partly by private subscriptions, places kindergarten work under the shadow of charitable schemes, and fails signally by being obviously unstable and limited. Kindergartens, being utilitarian and ethical in their essence and aims, should rightly become co-ordinated in your national scheme of educational reforms. The training of young women for this admirable work is of equal importance, its necessity running parallel with the establishment of kindergartens in all public schools. The study of Froebel's methods and their practical demonstration are higher education, rich in culture and in life's principles. Better than that, it carries in its soul the jewel of true womanliness, a working at the very fountain-head of intellectual and spiritual power and moral character. It trains young women towards home-life—not away from it. It is a profession full of depth and dignity, far better and more developing to their womanhood than office, shop, or tea-room. It is the very heart and soul of woman's work. In making the profession of a kindergarten teacher possible to the young women of this Dominion, and in developing young children on right lines during their most plastic years, you are setting the keystone of a higher social and civic life.

JOHN FARRELL examined on oath. (No. 31.)

1. *The Chairman.*] What is your position?—I am Architect to the Auckland Education Board, and have held that position for the last five years.

2. *Mr. Davidson.*] Can you give us any idea of the difference in the cost of building between this district and other districts?—It is difficult to make the comparison. The cost in Auckland is governed a great deal by the amount of work that is in progress at the present time, combined with the high price of materials. On account of the amount of work offering the cost of labour has risen, and timber has also gone up. First-class kauri timber is now costing 26s. per 100 ft., and other timbers are in proportion—for instance, the Waikato timbers, which we use for buildings in the King-country and the Waikato. In both cases it is practically a question of supply and demand.

3. Is the cost greater here than in other districts?—I have only the information furnished by the Department, and I understand that it is slightly higher here.

4. Do you find the Auckland District too large for the work to be carried out satisfactorily?—Not from my point of view. The only part of the district that is difficult to work is the Ohura district, but I manage it by means of a system under which I have four men in charge of the maintenance operations in various parts of the Board's jurisdiction. If schools are being erected by contract in the out-districts I arrange with our permanent men to inspect them periodically, and I make the final inspection personally. If the job happens to be near the railway I probably inspect it two or three times during its progress.

5. Is your work mostly done by contract?—The bulk of the new work is. The chief exception is in the case of the smaller schools in the backblocks, where it would be simply waste of time to call for tenders. In that case I employ day labour, or I may arrange with a builder who has carried out the building of a school in a neighbouring district to quote me a price, which if satisfactory is accepted. Our permanent staff consists of two foreman carpenters, a labourer foreman, and two painter foremen.

6. Do you find it satisfactory to keep these men permanently?—Yes.

7. Except as to the Ohura district, would you prefer the boundaries to remain as they are?—As far as I am concerned.

8. *Mr. Kirk.*] It has been suggested that all the building in the Dominion should be directed by a Dominion Architect. Do you see any objection to that?—I do not know that there would be any objection, provided that he could get on the work, but it would be necessary for him to have men in every part of the country to control the local works. The conditions differ so materially in the different parts of the Dominion that I do not know whether central control would effect any saving.

9. *Mr. Pirani.*] Have you ever worked out the cost of working of your department as compared with the employment of a private architect?—With a private architect the cost would be considerably greater. Some time ago, before the work of the office had increased to its present proportions, I found that under an architect's commission my salary would have worked out at about £1,200 a year instead of £600. At the present moment we have about thirteen or fourteen new schools in hand, besides six or seven additions to schools and teachers' houses. In the last two or three years we have built several new schools in brick.

10. *Mr. Hogben.*] Can you make any comparison between the cost of building near town at the present time and the cost three years ago?—Take the cost of a primary school built about three and a half years ago: the cost per square foot for class-room floor-space was 15s.; including

the hall and porch it was 11s. per square foot, with all the usual outbuildings. In the case of the Grey Lynn School, built about eighteen months ago, the cost was 17s. per square foot of class-room space, and including porches 12s. The Mandeville School, for which we have just accepted a tender, cost approximately 19s. for floor-space, and including porches 13s. 9d. All these were schools of the same standard.

11. Take the cost of small wooden schools: has there been any material variation in the last three years?—When I first took over the work here I used to reckon upon getting small schools to accommodate thirty or forty children built for something like 12s. per square foot of floor-space; and small schools for from twenty-five to thirty children for from 14s. to 15s.; and the cost of the larger wooden schools, with four or five class-rooms, was about 12s. 6d. per square foot.

12. Are you aware that the prices you have quoted are from 10 to 40 per cent. higher than in the South?—No doubt, in some places.

13. *The Chairman.*] Would it tend to economy if such matters as repairs to schools, fencing, &c., were to be done by local effort, subsidized by the Boards?—I do not think it would. In many instances where we have made grants towards the erection of shelter-sheds we have found that the work was done in a very inferior manner. That does not tend to save our maintenance account at some future time.

14. As a general rule what has been the treatment of your Board by the Department in respect to grants for new school buildings and additions to existing buildings?—We have been fairly well treated by the Department with respect to grants, insomuch that I have so far been able to arrange for the works being done within the amounts granted.

15. Has there been any undue delay in the making of grants?—Not more than is usually incidental to proper consideration of applications.

DUNEDIN, FRIDAY, 14TH JUNE, 1912.

DAVID RENFREW WHITE examined on oath. (No. 32.)

1. *The Chairman.*] What are your qualifications?—I am Professor of Education, Otago University, and Principal of the Otago Training College.

2. You have been for a number of years teaching in the schools of the Otago District?—I have been for forty years engaged in primary-school work in this province.

3. You are a graduate of the New Zealand University and a Master of Arts?—Yes, and hold an A1 Certificate under the Education Department.

4. You know fairly well the text of the several matters referred to in His Excellency's Commission. Have you any views to offer in respect to them?—I wish to refer briefly to one or two points in connection with primary education. First, I would call attention to the large increase in the number of subjects that has been taking place not only in New Zealand, but in other countries also. Many years ago we confined our education practically to three subjects. These have been increased to six, nine, twelve, fifteen, and eighteen, and I dare say if we were to go on adding all the subjects suggested by Naires and others who write on education we might increase the list to twenty-five subjects that, according to the views of some people, we ought to teach in our primary schools. I should like this Commission to consider whether it is wise on the part of those who administer our primary schools to have so many subjects as we have at present. This numerical increase has been intensified in this way: that we have subdivided the subjects themselves. As an illustration, what was formerly spoken of as "geography" is divided off into "critical geography" and "mathematical geography." I think that kind of subdivision has, to a large extent, increased the field of our operations in the primary schools. I do not think those facts are disputed by any one. What has been the effect of this? One result is that, as compared with twenty or thirty years ago, we have now more "once a week" subjects; and I believe that any increase in the number of subjects taught in the primary schools will lead inevitably to an increase in the number of subjects that can only be given once a week. Now, a "once a week" subject in my experience may be necessary, but as a matter of mental discipline or training a subject taken only once a week is not really of much educative value. At least, we ought, I think, to limit that tendency. I am quite sure it is a tendency forced upon us by the large increase in the number of subjects. I am in contact with primary-school pupils nearly every day of my life, and have been so for forty years, in the province, and I feel that if we are going to increase the number of subjects in the primary schools, or even retain the present number, it will and does necessitate a hurrying-on from lesson to lesson on the part of the teachers, and this often leaves a lesson in a scrappy or unfinished state. That is rather, I think, the tendency of the present day—a tendency I think we ought to avoid by keeping down the number of subjects in the primary-school course, taking them more slowly on the part of the teachers as well as on the part of the pupils. All sound educational work is slow work. I feel that the more we increase the field of study the less accuracy and thoroughness we secure in the subjects studied. As a general principle I do not see how any one can avoid that conclusion. As to how the difficulty should be met, I also have some notion as to that. In Germany, in America, and also in our own land I think educational authorities, heads of training colleges and others, have been trying to meet that difficulty of the ever-increasing number of subjects, and still retain in the primary school the same field of study, and secure also thoroughness and efficiency. We have been trying in the first place to co-ordinate the subjects—to see if we can bring two subjects together and so accomplish the work in the time usually given to one. Speaking from my own experience, I frankly confess that after years of trial in that direction I have been able to do very little in the way of effective co-ordination—that is to say, co-ordination that would obviate

to any extent the disastrous effects of too many subjects; nor am I hopeful that any known system of co-ordination will meet the difficulty. Those interested in the education movement have tried other methods. They have tried to meet the difficulty by concentration of subjects. In my opinion, all schemes of concentration have been and will prove an absolute failure. The main objections are psychological. I believe all such schemes are in contradiction to the processes of mind-development. I believe they are condemned both in theory and in practice, and I have no hope of an amelioration in that direction. It has also, I know, been urged that we might get over a larger programme by lengthening the hours in the primary schools. On that point I have nothing to say, both for the sake of your time and mine, and I leave it there. With regard to simplification of the syllabus, that is largely a matter for experts, and a matter also upon which the public might have some opinions.

5. We regard you as an expert, Professor White, and should be pleased to hear your views?—Well, I will just mention three points which I think require consideration. First, I think we perhaps begin some of our subjects at too early a period in school life. I should like to see the syllabus revised. For instance, in the infant department I should say we might do away altogether with formal writing. Such writing implies a very exact co-ordination of the muscles of the hand, and at so early a period of life it ought not to be asked. When I see the little tots endeavouring to adjust their three fingers I feel I am asking altogether too much of them. Then take the question of history. History is a difficult subject however simply it may be treated, and I think it is probably begun too early in our schools. The same applies to civic instruction, which begins, I think, with the Third Standard.

6. *Mr. Hogben.*] No—from the Third?—Well, I believe civic instruction to be a most difficult subject. In the first place, it implies a knowledge of existing institutions which our young children really know very little about—Courts of justice and their constitutions and powers, and so on. It approaches more closely to constitutional history. I think we ought to keep that in view if an alteration in the syllabus is to be made. Acting on this principle, if we are at all in doubt as to whether it should go into the Third or Fourth Standard, put it into the Fourth. That will be one way of limiting the subjects of instruction. It will give the mind time to grow. It is better to begin too late than too early with any of our subjects. I do not say there has not been some improvement in this respect, but I think there is still room for cutting down the syllabus in the scheme of work. The subject to my mind most neglected in our course of instruction is the training of the understanding of the pupils by the giving of more attention to the subject-matter contained in the lessons, and to a knowledge of the language in which those lessons are couched. Another subject which it seems to me demands more time than we give to it is written composition. It would be better if far more time were devoted to this subject as a mental training for our pupils. I hope my criticism will not be taken as in any way condemnatory of our present system, and I only speak in this way because I believe it is capable of some improvement. Well, as regards oral instruction, I believe it is better now than it has ever been, and I would continue it still further. I would not have written composition in the Second Standard at all. I should postpone it until the pupil had some knowledge of the construction of sentences, because when he makes an error in his little composition it is not sufficient to say to him, "That is wrong": it is necessary to give him some reason or rule so that he may not commit that error again. Then, from the primary-school course I should strike out nature-study as an independent subject. It is a most elusive subject, and it bears upon the whole programme of instruction. It means nothing and it means everything. It is connected with so many independent subjects of study, and that kind of thing I think we ought to avoid. If nature-study is to be retained as a subject it ought to be taken, I think, in conjunction with the prescribed lessons in the readers. There is ample material in the readers for that purpose. There should be an explanation of what is contained in the written lesson. Nature-study implies a detailed observation and analysis of the parts of plants, for instance—sometimes requiring almost a microscopic examination. I am not sure that we are not beginning to train the observation too early. There is the same tendency with regard to science—the tendency to bring all the "ologies" into the primary-school course. In my opinion science even in its most elementary form might perhaps be better relegated to the secondary schools, or only taken after a boy has passed the Sixth Standard. That might seem a sweeping kind of reform, but my objective is the bringing-down of the field of instruction. Then there is the subject of hand-work as distinct from manual and technical work. Hand-work is described very clearly in the Inspector-General's report, so that I need not detail what it is. Hand-work with paper and cardboard, and block and figure laying, have been made independent and separate subjects, and the attempts to co-ordinate them with drawing has had the effect, I think, of interfering to a great extent with the teaching of drawing itself. We have taken from drawing the time which should be given to it. I want to emphasize the necessity for more time being given to drawing as a primary-school subject. Its educative value lies in the fact that it must always be the basis of all technical and manual instruction afterwards. I should like to see our boys have a better knowledge of drawing when they leave the public schools than they do at present. With regard to manual work as apart from what is called hand-work—I mean ironwork, woodwork, and subjects of that kind—I have very decided opinions. They may not be classed as trade subjects perhaps, but in some cases they do involve the use of trade tools, and I think it would be wiser to postpone all those subjects known as "manual" until our boys and girls have gone through the primary course of instruction. That is all I have made a note of so far as primary-school work is concerned.

7. *The Chairman.*] Have you any views with regard to other matters in the order of reference, such as overlapping and duplication?—Well, I am not so sure that overlapping takes place. It seems to me there is rather a separation of subjects and a want of continuation of the subjects that have been commenced in our primary schools. Take, for instance, our manual work: I

do not think it is continued in the secondary schools at all. However, my attention having been confined generally to the work of the primary schools, I do not profess to know more than other people with regard to subjects outside that work. With regard to agriculture, I do not think it can be taught in primary schools at all. Agriculture is looked upon as a science. It implies a knowledge of chemistry, and it ought to be taught thoroughly. I fear, although it is not a popular thing to say, this demand for agricultural instruction does not proceed on right lines. The only places in which I think it can be taught are well-equipped district high schools, or in some technical college established for that purpose. That I know to be the opinion of the head of the Lincoln Agricultural College—the highest expert in agriculture in the Dominion. As to the financial aspect of the matter, I would just say, if there are funds available—more money available than we have at present for education—I think money should be devoted to increasing the salaries of teachers in the small schools. With regard to instruction in technical schools, I see the head of our school here, and he will know more about it than I do. But with regard to the training of our boys after they leave the primary schools, I believe it ought to be made compulsory for all boys to take some instruction in a technical school. I would not compel them to take the regular course, but would rather say to the lads, "You must take one subject; you need not take more." It might be that a boy was fond of mathematics or science. Let him take that subject and no more. To ask a boy to take the full course after his day's work, in my opinion, is not wise. Then, I think some physical training for a period should be made compulsory, for it seems to me that we have a great deal of apparatus that we do not now use. For instance, we have large gymnasia in connection with our public schools, and I do not know that they are ever used at night for the purposes of physical training. I would have those boys compelled to spend one hour a week. If that were done you would soon find that our gymnasia would be crowded nightly with our boys. The military training for boys that has been brought in recently is justified largely on the ground that it is physical training. I suppose it is so, but I think our boys require mental training also, and you would get that in the way I suggest. The military aspect, of course, does not concern me except that incidentally if the scheme is to cost over half a million of money perhaps a quarter of a million of it might be devoted to the training of the intellect in the way I suggest in our technical schools and gymnasia. With regard to the Bill brought in by Mr. Sidey a year or two ago, I know the Department has done something in the direction suggested in that measure, but I do not think it has gone quite far enough. Schemes of that kind, of course, can only be carried out in large cities. I do not see how the difficulty is to be overcome in rural districts. Speaking generally with regard to rural education, we cannot expect in a young country like this to be at all fully equipped in that respect. I do not think there should be any more technical instruction in the sole-teacher schools. I do not think the sole teacher ought to be asked to carry out everything that is taught in a city school. I would limit the subjects for those schools. It may be said, of course, that you are not giving the same education in the country as you are giving in the cities. Well, education does not consist in the multiplication of the subjects taught. It consists largely in the way in which the subjects are taught and the mental discipline that is attained. The general desire to make our education free from kindergarten to university is, I think, an ideal which we ought to work up to, but there are obvious restrictions which ought not to be disregarded. For instance, I feel sure there are a number of our boys and girls who are taking advantage of secondary education who really have not the necessary capacity for such work, and who would be better employed in the study of other subjects. It is just possible the same thing will extend to the University, and the recent movement in that respect so far as our teachers are concerned was a very wise advance on the part of the Minister of Education. You cannot possibly open the door too widely to our teachers. The proposal to allow all teachers with a C certificate to attend University classes and have their fees paid and other recommendations of a like nature are, to my mind, on the right lines.

8. *Mr. Pirani.*] I suppose you are aware that the suggestions you made with regard to nature-study and the lines that you considered should be followed are contained in these instructions on page 149 under the heading of "Nature-study": "The lessons given in the lower classes should be marked by two main characteristics: In the first place they should be really lessons on objects, or natural phenomena—that is, they should treat of things that each child in the class can see with his own eyes or can handle with his own hands; secondly, they should not be disconnected, but should form a course of lessons co-ordinated with one another and, as far as possible, with the other subjects of instruction." Was not that what you suggested should be done as an amendment?—No; what I suggested was that the nature subjects should be those which are largely contained first of all in the readers themselves, and that there should not be a separate course of study apart from that. I said also I did not think you could co-ordinate.

9. Other people think you can?—That is so.

10. Can you see any difficulty in teaching nature subjects by means of objects which they can see without a microscope?—I said they would almost require a microscope.

11. You do not think they should be given nature-study at all?—It depends on what you mean by "nature-study."

12. That is a matter for the teachers?—Yes, but teachers differ, and that is why I am objecting to it as a separate subject. I do not mean that certain kinds of objects should not be referred to in the primary schools.

13. I only wish to be clear as to what you mean?—Then I wish to supplement what I said. In the infant department of work there are certain things, of course, that we should talk about. I think that in the work of Standards I, II, and III to arrange a definite course of nature-study apart from the reading-lesson is liable to abuse because of the nature of the subject selected and because of the treatment of the subject—too wide and too scientific. I admit it is a matter of method to some extent, but I should prefer, myself, that if nature-study in that limited way is

to be given at all it should be in connection with the subjects taken in their course of reading, and not separately. There is no set of readers now published that does not contain such courses. If a separate course is taken it means duplication, and the work is not done thoroughly. I am directing my criticism to this in view of the efforts that are being made to bring down or narrow the field of work.

14. You think it would be wiser to postpone hand-work, such as cookery, I suppose, woodwork, and manual work until after the pupil had left the primary school. How would you get at the pupils who had left the primary schools?—I did not say I would leave it until after the pupil had left the primary school. I said, "after he had passed the Sixth Standard." As you know, there are seven standards now. I have no objection to a boy or girl learning those subjects if I am satisfied that they have got through their Sixth Standard course of primary instruction.

15. What percentage of the pupils who have got through the Sixth Standard remain at a primary school?—I am not prepared to say.

16. Would you be surprised to know that not 20 per cent. remain?—I cannot say what the percentage is.

17. I want to know how you are going to get those pupils who have passed the Sixth Standard to take up these other subjects, such as cookery, woodwork, and so on?—By including them in the Seventh Standard, or by continuation classes, which I should make compulsory. I made that clear.

18. You said the pupils who attended the continuation classes should be allowed to choose their own subjects. How, then, are you going to compel them to take cookery or woodwork?—I referred to two different classes of pupils. There are day classes and there are evening classes. I am quite sure the boys and girls largely will be sent to the day classes, where there will be a definite course laid down. But for those who have to earn their living in the daytime it should be optional as to which subjects they took up. There are two classes of pupils and there are two courses of instruction.

19. You say those who are compelled to earn their living in the daytime are the ones who should not be compelled to take useful instruction of any given kind, but should be allowed to take what they choose?—There is another way of meeting that difficulty—a difficulty which, if I had time, I should have referred to in connection with Mr. Sidey's Compulsory Continuation Classes Bill. The difficulty comes in here, as we know it does in every country, as to how far is it well to compel employers of labour in certain hours to free their youths from their occupations for the purpose of instruction in the subjects I have referred to. That is how it is met in other lands, and that is what we shall have to do here also, I think.

20. Then you would not have compulsory attendance at continuation classes unless the time were taken from the employers' hours?—I have not committed myself to that. That is only one way.

21. Do you know of any other way?—I do not know of any at present.

22. I think you said you would confine agricultural instruction to such instruction as is given at Lincoln College?—No; I mentioned the district high schools.

23. You referred to Lincoln College: do you know how many pupils they turn out in the course of a year?—I do not.

24. Do you think the Lincoln College meets in any degree the scarcity of instruction in scientific agriculture?—I know nothing at all about its management or efficiency. I am disposed to think, however, that it might be advisable to have in different parts of the country a kind of school of agriculture leading up to the Lincoln College.

25. A sort of preparatory school?—Yes.

26. Would you be in favour of scholarships for sending promising pupils to Lincoln College or some such similar institution?—The scholarship system is a very wide subject. I think what you suggest would be a very good way, but I do not propose now to discuss the scholarship system.

27. *Mr. Davidson.*] In regard to nature-study, do I understand you to say that you object to that subject appearing on the time-table as a separate subject?—Yes.

28. Would you have nature-study permeating the whole of the work of the school as far as it can be taught casually?—In that way, yes.

29. In regard to physical training, I think you said you thought the many gymnasia about the city and suburbs should be used for the purpose of physical training in connection with our boys. Is it not a fact that many or most of these buildings are used at the present time for that purpose?—I am not aware of that. Our own is not so used.

30. I was thinking of certain gymnasia where scouts are taught physical training, and in which there are also gymnastic classes on one or more evenings of the week, and I was wondering whether that was not a general practice?—I was speaking of compulsory physical training. Your question suggests a point I might add with regard to physical training in our schools. For instance, it is said that all boys should learn swimming as part of physical training. That is one branch. Then they are supposed to take certain definite physical exercises which take up a certain section of time; and then they have, also, in addition to that, a kind of military drill. I have never been able to see much good in this marching about the playground, forming fours, and things of that kind, and I was rather gratified to see a high authority like General Baden-Powell taking the same view of the matter. I do not disregard the value of physical training, and I am not sure whether in the syllabus we could not bring that physical training somewhat into line.

31. Are not breathing exercises taken in every school?—Yes.

32. You consider that a good form of training?—Yes; but it is just possible whether that half-hour a week spent in the playground in physical drill is sufficient. A boy or a girl is not growing only on that particular day when you take him out. He is growing every day, and would it not be better that the regulation should say that ten minutes every morning or every afternoon should be given rather than spend half an hour or two half-hours in the playground per week? I am not quite sure whether that would not be a move in the right direction.

33. Are not physical exercises taken now in all schools five or ten minutes every morning, and frequently during the day?—The Inspectors can answer that, but it is not a general rule with us.

34. Turning to the question of scholarships, would you insist upon those pupils from our primary schools entering the secondary schools having some form of guarantee given by their parents or guardians that they should remain in those schools at least two years?—I think it is a most desirable thing. Perhaps it should be provided that if they are not prepared to undertake to remain there that time they will not be allowed to enter.

35. With regard to the classification and training of teachers, have you seen the *Gazette* issued on the 15th February last containing these regulations?—Yes.

36. Do you think that such regulations before coming into operation should have been considered by the Principals of the training colleges, Inspectors of Schools, and others who are deeply concerned in the matter?—Obviously.

37. What is your opinion of the effect of these regulations upon the uncertificated teachers in out-of-the-way places?—I do not know that they contemplate the existence of uncertificated teachers at all. They are an anomaly in our system, and the regulations on the whole are, I think, distinctly an advance and improvement on the existing regulations.

38. Do you think it should not be possible for many of these uncertificated teachers in out-of-the-way places to become qualified?—I think some special provision might be made by the Department for their training, and probably less exacting conditions might be arranged for them until the Education Boards have finally got rid of them altogether.

39. Do you approve, then, of the increased difficulty in connection with the obtaining of these certificates?—I think so, for this reason: Whilst we worked under five grades of certificates, A, B, C, D, and E, for a number of years, the D certificate when the E was abolished was not very much higher than the former E certificate. I think, myself, that the standard of work required there is not beyond what our Training College teachers should have on leaving the college.

40. How would you overcome the difficulty in connection with the presentation of a certificate showing that a course of practical work had been taken by those teachers?—When I expressed my approval of the course of work I might be allowed to make this reservation, that I think the work in science demanded there is rather excessive. As some of you know, I have never approved of the course of science given in my Training College, but there is a possibility now of it being placed on better lines. But I still think that the amount of practical work insisted upon in those regulations is far too great. The relation of some theory in science to practice in science, by lectures, is rather an important matter, which I find as a matter of daily practice we are not able to give. I do not think it is wise to give more than a quarter of the time to the practical work if students have to pass an examination in theoretical science. You must give time to lectures. I am not sure that we do not undervalue the effect of lectures. A lecture is a text-book, and no one undervalues a text-book. I think too much opposition has been raised by scientists themselves to this use of a text-book. If you are going to insist upon an examination in science—by that I mean a written paper on the theories of science—you must use a text-book or you must lecture. We are opening up now a new era, to which I have been looking forward for many years, and have urged in vain should be brought in. It would be possible now, I think, to get our teachers better trained in the matter of science. The difficulty has been that we have attempted too many sciences, and the Department has very unwisely, I think, put in the foreground physiology, the most unsuitable for primary-school teachers of all the subjects you could name. The Department has certainly now struck out the word "physiology" and put in "hygiene," but physiology is there all the same.

41. How many students have you at the Training College?—106 at present—thirty-eight men and sixty-eight women. Last year we had forty-eight men and fifty-two women—the highest number of men in the history of our Training College, and the highest number that have attended any training college in the Dominion, and a very much higher percentage than will be found in other countries in the world. Whether it will continue or not I do not know, but I hope it will.

42. Do you think sufficient provision is made in connection with the Training College for practically training in the art of teaching and controlling classes by students?—For a two-year course, I think, as much as you could possibly get, and, I was going to say, an adequate amount. Every student who leaves my College has, during his last year, spent ten weeks in practical teaching out of the forty. I am not saying that that is sufficient. What I would like to see is this: a third year's course in the Training College, and that in that third year the student should be sent to get practical acquaintance with classes in large schools. That I think would make our system as complete as any system of training teachers with which I am acquainted, and I know the German, English, and American systems.

43. Do you think it would be a good plan if in the immediate neighbourhood of Dunedin the smaller schools—that is, the sole-teacher schools and perhaps the two-teacher schools—were in charge of highly qualified teachers and your students had the opportunity of visiting such schools?—I should not have them sent there either in their first or second year. Opportunities might be given for that class of school in the third year, as I indicate. As you increase the number of students in the College it becomes difficult to get in the necessary amount of practical training; and when I said just now that last year the students got that amount of practical training I omitted to say, in connection with our model school, we have forty juniors and practically sixty senior students, and where the sixty come in it is not possible to get in any one school the amount of training I spoke about. Our students leave the College, so far as that department of work is concerned, the small-school work, only having had one fortnight's continuous training or observation in small schools. We are obviating that to some extent.

The Board recently appointed another school, and we hope now to duplicate the amount of time given in these schools. The more I see of the training of teachers the more I am convinced of this: that it is not advisable to throw them too early into the practical conduct of classes and pupils. I think we make a mistake there, just as we do in the training of our pupils in the public schools by beginning them perhaps too early with subjects.

44. What in your opinion is the attitude taken by your students towards their university work and their practical work of teaching—that is, do they take more interest in their university work than they do in the actual work of learning to teach?—I think I could answer that generally by saying that my most successful university students are also my best teachers.

45. *Mr. Thomson.*] In your opinion do you consider the boys leaving the primary schools to-day are as well grounded as the boys leaving fifteen or twenty years ago in the fundamentals of education?—I do not think they are in writing, reading, and arithmetic.

46. Do you think there should be more home work in connection with our primary schools?—No. I should have very little home work, or none at all. The only kind of home work that I recommend would be perhaps the learning of their poetry, a subject greatly neglected in our public schools. It is impossible for us to say to the pupils, "During schools hours learn that poetry." We cannot afford the time. But it is essential that all our boys and girls should leave school with a good acquaintance with some of our best poetry, and I do not think they know their literature—by which I mean the knowledge of books and poetry—as well as boys did a few years ago.

47. Do you think that travelling school libraries would be a good innovation?—Yes, I do.

48. Do you think that the teaching of history should be made compulsory in Standards IV, V, and VI?—There is an objection on the part of coreligionists to the teaching of history in public schools, and we are not allowed by the Act to teach it.

49. *The Chairman.*] Would you treat civics as part of history?—I think civics might be separated from history, and, if so, I do not think there would be the same difficulty in teaching it. It could be separated from all questions of religion. Immediately you go to the history of the past there are difficulties.

50. *Mr. Thomson.*] I was rather meaning that phase of history which builds up respect for one's nation, and so on?—I hold very highly the opinion that we ought to teach history more thoroughly than we do at present, and I offered all the resistance I could to the change that was made some few years ago when it was left to the option of the teachers to take history just as a reading subject. To read it without being questioned upon it was, I think, a mistake. But there, again, if you want history thoroughly taught, or taught as it must be if well done, you have to make room for it.

51. In regard to the teachers' training colleges, is it your experience that a number of students are using the Training College as an entrance-door to some other profession?—I have been twenty years in the Training College, and I am aware that the assertion has been made that the training colleges are used as an entrance-door to some other profession, and of those I have trained a few have left to go in for medicine. I do not think, however, that a sufficient number has left to justify a condemnation of the colleges on that score. I do not see any reason why a student at the end of his term when he finds, as one of mine expressed it, he "was not cut out" for teaching, should not enter that profession for which he feels an aptitude. The State has not lost much by it.

52. *Mr. Poland.*] What remuneration is given to students preparing for teaching work in the college?—Those whose home is in the city get £30 a year and University fees, and those coming from a distance get £60 and University fees. I think this is a very generous remuneration. I do not forget the service the Inspector-General rendered to education in the matter of organizing our training colleges in past years.

53. Do you think it is desirable to allow a teacher in the training college, if he or she finds they are not suited for the calling, to leave the teaching and enter some course more congenial?—There is a bond which provides they must do a certain amount of teaching as a kind of return for the money spent on them. From a teacher's point of view I think it is desirable that every one who does not enjoy his teaching should leave it.

54. You have mentioned several subjects which you consider should be given more attention in the primary schools. You mentioned composition and drawing, and you would give these subjects more attention by reducing the number of subjects. Are there any other subjects you consider should be given more attention in the primary schools?—I refer to the whole question of the selection of his reading. Speaking of the three Rs, they may contain a great deal or very little, but reading has such a wide influence on a boy's life and character. Take reading first of all as a mere physical exercise. Do they speak as distinctly or as accurately as they could do? Are they keeping up the standard of the English language and giving sufficient time? I do not think they are, and more time might be given. As for reading, which includes the meaning of words, do they know the meaning and application of words and their intent in order to get an intelligent reading? It is a united subject, and all teachers should have more time to give to it. If that were done we would be equipping a boy or girl in a way wider than most of us imagine. Really, if we could imagine how many false notions are abroad because boys and girls are not taught to think through reading we would give more time in the primary schools to that subject than we do now.

55. You think that sufficient time is not given to the teaching of English language?—I would like to give more.

56. And have some other eliminated?—What I have suggested is this: that instead of having an elaborate syllabus as to what teachers should give and not give, there should be some simplified form which says, "These are the subjects, and these are the important ones, and every teacher in this Dominion shall be compelled to give so-many hours out of the twenty-five to these subjects."

It would be a great safeguard; and if a teacher takes up any particular branch, then he must give so-many hours to that. That is the difficulty of our syllabus. Teachers do not see the relative value of subjects. They have fifteen subjects put before them, and one is as important as the other, almost. You say that the matter of arranging the time-table should be left in the hands of the teachers. I should prefer that the Department should say in regard to these matters that relatively we expect to find so-much time given to this subject, and if the teacher knows his work all would be well with that subject in the Dominion.

57. You turn out a large number of trained teachers from the College?—It has been in existence continuously for thirty-six years.

58. Do you find that the College is supplying the wants of the country with regard to certificated teachers, or is there still a large number of uncertificated teachers in small country schools in Otago?—I think the Board's officers will tell you there are still a large number of uncertificated teachers in Otago. Our four colleges have not quite met the position yet, although I thought they would. The reasons why, I need not enter into now.

59. Some of your best teachers go to other districts, perhaps?—Yes, we have sent a large number to other parts of New Zealand.

60. Two Boards, Auckland and Wanganui, have a system by which teachers are graded by the Inspectors, or on the advice of the Inspectors, and appointments are made in accordance with the grade of the teachers. Do you approve of that system of appointment? Do you think it is preferable to that in existence formerly, of submitting names to Committees and allowing the Committees to choose one of half a dozen?—I think that plan has worked very well. I think the Board has certain functions. Those functions are to keep up the standard of efficiency on the part of teachers for every grade of school—that only those who hold a certain certificate should hold a certain position. I think that is probably where the Board's functions should end in selecting teachers, consulting, of course, with the Inspectors. I think the Committees have also a function to perform. They are interested in their schools, and I would give them a certain amount of selection. Also, I think in the case of large schools headmasters should always be consulted with regard to the appointment of members of the staff.

61. *The Chairman.*] By whom?—The Board or the Committee, or both. With those three restrictions, appointments fairly carried out would quite meet the case.

62. You think the Committees should be consulted and have the actual power of choice out of several submitted?—Within a certain limit: the Board having said, "That is our number, take one." The Board is satisfied the teachers have reached a certain standard.

63. Supposing that one teacher in the opinion of the Board, on the advice of the Inspectors, is better qualified for a particular position than any other teacher, do you think that that teacher and two or three other teachers less qualified in the opinion of the Board and the Inspectors should be submitted to the Committee and that the Committee should have the right of choice?—I would not like to answer that question.

64. Do you not think that the best teacher and the best entitled should get the position?—That goes without saying, as a general principle.

65. Do you think that the members of a School Committee are in as good a position to decide which teacher is the most suitable one for their school?—I do not think they are, as a general rule. I assume that the Education Board with the Inspectors and officers are, as a matter of principle, the best judges in that way.

66. Do you think that the teachers of secondary schools should receive training as teachers?—It is very essential, more particularly in keeping up a continuity from the primary school, and I hope the time will come when all teachers who take their place in the secondary schools will have had a primary-school training.

67. Do you think the inducement in the matter of salary for teachers is sufficient to obtain in this country the best talent possible for that work?—Just at present, when there is a dearth of teachers, some of our trainees began in their first year with a salary of £180 and, I think, in one case £240 a year on leaving the Training College. That perhaps is a little exceptional. I am quite sure that the heads of our large public schools should be paid very much more than they are, because if they wish to enter into law or other professions they can get much larger salaries. If you do not pay the heads of the large public schools much more than they are getting now you cannot expect boys of talent to go in that direction. I am quite sure of that, because our young men very early see that it is a very restricted field. They see they are not likely to get more than £400 a year if they work all their life, whereas their friends, no better qualified than they are, who enter the law or medicine as a profession do so much better.

68. You think the prizes in the profession should be largely increased?—I do, and I say it as one who is now coming near the close of my work. If you pay those at the highest point much more than they are being paid now, you will induce a much greater number of capable men to enter into and remain in the profession.

69. *Mr. Kirk.*] You do not mean to imply that the salary is the only thing that the teacher looks to, and that he has no other ideal?—Not at all. Speaking for myself—and I may be pardoned the allusion—I do not know anything I would have like better than teaching during the whole of my life, and therefore I have been content to carry on the work, even if I might have made more in something else. I like to keep the mere materialistic phase in the background when addressing the students, but you cannot keep it from the young men altogether.

70. Do you favour the introduction of a scheme of Dominion promotion for teachers?—I have not had time to think that out, but I would just say this: I do not believe in any parochial administration of our education. We have had no reason to complain of our teachers going to other provinces and being admitted, and I do not see why they should not come from other districts to ours.

71. *The Chairman.*] Is there a free entrance to teachers from another education district to this?—I cannot quite understand the objection. Three of my students went to Christchurch at the end of last year after finishing their course. They told the Chief Inspector there that they could not get into a city school in Dunedin, and would like to get into a Christchurch school. Obviously the reply they received was that the Christchurch people must look after their own teachers first. There is a certain amount of loyalty, I suppose, to one's own district, but beyond that I do not know that any Board is absolutely against it. I do, however, remember one instance where a Board has made a restriction of that kind. I do not think it is wise.

72. Do you think it is proper?—No, I do not.

73. *Mr. Kirk.*] Do you think drawing should be taught more largely than it is in primary schools?—Yes.

74. Even in the infant department?—Yes; I would like to see it there take the place of writing.

75. You spoke of writing as requiring very exact co-ordination of the muscles of the hand: would that objection not apply to drawing?—I think not.

76. Is it that our system of writing is at fault?—To some extent.

77. At what age, in your opinion, should children enter a primary school?—It all depends on the kind of work you are going to give them. I have been associated with kindergarten schools since they were first established here, and I think that with great profit children might be employed at five years of age. I would like to see the kindergarten training carried on until the child is seven years of age, and the primary-school course proper might begin at, say, the age of seven years.

78. *The Chairman.*] That is the practice in Germany, is it not?—I think so. That only carries out what I was expressing in my own way—namely, to postpone, if you can, until a later period the beginning of all formal training.

79. *Mr. Kirk.*] Speaking generally, what should be the aim of education in the primary school?—I should say, a more thorough knowledge of the three Rs.

80. Is the teaching in primary schools sufficiently correlative between the school and the pupil's future life-work?—I think if the foundation in the three Rs is laid in the way I have indicated they have got all that is necessary for them to get.

81. Does our system give a reasonable guarantee to parents that their boys and girls are being turned out fit to usefully use their brains?—That is a very difficult question to answer.

82. It is really at the root of the matter?—Yes, but it depends on what your ideal of primary-school work is. I can only say I should be justified in expecting pupils to carry out their life work more successfully if they were more thoroughly grounded in reading, writing, and drawing, and the elements of arithmetic. So far as we are not doing that, I should say we are not in that sense quite equipping them as well as I should like to see them equipped.

83. Have you anything to say, favourable or detrimental, in regard to the examination of school-children?—I have very definite ideas about examination. The tendency of modern days is to undervalue examination, to undervalue its educative effect. There can be no education without examination. But here, again, examination only means revision. It is not examinations we ought to seek to do away with, but the manner in which those examinations have been carried out in the past. We must examine in every phase of education—primary, secondary, and university. It may be oral examination or written examination. The objection is generally to the written examination, I believe, and in my opinion no one knows what he is talking about until he can put it down in writing. I do not know what my students may think until I say, "Will you put down what you think." We may have had too many examinations—I do not know; but I am quite sure of this: that the examination in primary-school work, especially for the leaving examinations, should be almost exclusively in the hands of outside authorities—the Inspectors. I fear that this indiscriminate authority of allowing the headmaster to pass his pupils is leading to a lower standard of efficiency generally. Although we often discuss that a teacher should be the best judge of what his pupil can do—and that is to a certain extent true, and if that is to be defeated by passing them to the Inspectors I should be against it—but I feel this: that I never yet knew an Inspector to "fail" a student who deserved to pass, and the Inspectors have always been ready to consult the teacher. Obviously, in the case of small schools, to throw the reponsibility on the hands of the teacher is not, in a local district, an advisable thing to do. It is now being discussed, as in university circles, whether there should be outside examiners or not. I think in every subject of examination, whether it be for a certificate, a diploma, or a degree, we should call in the judgment of some one who has not been engaged in the actual teaching of that subject.

84. *Mr. Wells.*] In answer to a question you said you did not approve of home-work except in recitation. Would you not include reading and spelling?—Yes, I think those subjects are just as necessary as poetry.

85. You also expressed the opinion that the work of the three Rs in the primary schools was not as good as it was twenty years ago. In Auckland we were assured by leading business men that reading and writing are better now than was the case with boys twenty years ago. Do you indorse that?—You may have been in a very bad state twenty years ago in Auckland; I do not know. I do not teach every day now, but I have taught all the standards, and I have before me every week classes in my own school. I know they cannot add so quickly and multiply as they used to do in the Sixth Standard. They are generally slower. Of course, the same time is not now given to English. There is a certain amount of time given to reading, and they may be able to read with fair fluency, but the understanding is not so good. The Inspectors are the best judges of that so far as the whole district is concerned.

86. Do you think that arithmetic might be simplified still further?—Yes. I do not think that we require to hold to the old historical subdivision of arithmetic.

87. At about what average age do your trainees enter the Training College?—About eighteen.

88. They are twenty at present when they leave?—Yes.

89. You are suggesting a third-year course?—Yes.

90. Do you not think that with the present small nature of the prizes to be looked forward to, if they had to serve a three-years instead of a two-years apprenticeship, it might make a still larger number disinclined to enter the profession?—A medical degree could not be got under a five-years course.

91. But the reward is much greater?—That is so.

92. If you are going to lengthen the period of training will it not be necessary to increase the prizes?—We might obviate that by beginning a little earlier the pupil-teacher or the training-college course. I think you are quite right in your suggestion of what the effect might be. It has been said that the long course has been the means of keeping teachers out, but, having regard to efficiency, I do not see how you are going to obviate that.

93. What proportion of your students are Class B students?—This year none were admitted but those who had been pupil-teachers. We refused all except two, who were admitted under the provision of having obtained the B.A. degree before entering.

94. You give preference to those who have served their pupil-teachership?—Yes, we had no room for more.

95. Do you find those students who have had no previous experience of teaching turn out satisfactorily?—Yes. Taking the average capability, many have done remarkably well; but, as a rule, they have been a little older than the average student who has been a pupil-teacher.

96. Here in Dunedin do the trainees get the whole of their practical training and observation of teaching in the Normal School?—Yes.

97. In Auckland we have a system under which the Inspector picks out a number of, in his opinion, first-class teachers in different schools, and in the second year one or two students are attached to these teachers to observe their work. Do you think that a good system?—We had in Otago a number of years ago a system of associated schools comprising the city and suburbs. Mr. Fitzgerald had experience of that, and so had I. If it rested with me I should not revert to that system. I should favour it in the third year, not in the second year.

98. You do not find that pupils in the Normal School suffer at all through the amount of practising done on them?—It is a very common opinion that such is the case. I might say that if you look up our Education Board report you will find that the Normal Practising School has received "excellent" all round, and I am not sure if it was not the only school in the city to receive that mark. There are compensations in the students going to that institution: I have often heard that said. So far as our own schools are concerned, I think I might appeal with very great confidence to the fact that, although it has been the practice for twenty-five years, the Normal School pupils, I think, have not done worse than others. I think I am right in saying they have done as well as the pupils of any other school of a similar size.

99. Has Dunedin any hostel in connection with the Training College?—No.

100. Do you think it is advisable to introduce one for the boys and one for the girls?—Yes, I should very much like to see it.

101. You think they are an advantage?—Yes, the social life and training they would get by coming in contact with each other would be beneficial. I may say that, as a member of Knox Residential College Council, it was their intention at one time to admit some of our students, and in the first year four of our students entered, and others have been promised places. I found it was a very great advantage to the students who entered that residential college in their training as men.

102. Is there any shortage of teachers in this district?—Yes; I think there are about twenty or twenty-two vacancies being advertised.

103. Would you approve of the suggestion to bring any teachers from Home?—No. I do not approve of what you do in Auckland, sending Home for teachers for heads of the schools. We can quite well train teachers to take charge of schools of that kind.

104. Do you think teachers in the backblocks might be allowed to take the D certificate in three sections?—These teachers in the backblocks are of different classes. Some of them, I am sorry to say, have been through the Training College, and some of them were not as diligent students, from various reasons, as they might have been, and I think we ought to take care in opening the door too wide for some of those.

105. There will be a large number of teachers in the backblocks who are really desirous of doing their best, and they will find it very difficult to get their certificates?—If my memory serves me right about two-thirds of the whole of the schools are sole-teacher schools. The training of our teachers for the backblocks is a very important problem. I think that perhaps if they were paid better we might get over the difficulty by that means. I do not think you should open the door too wide. I do not think that they should be allowed to get their D certificates on very much easier terms than they can be got at the Training College. I fear the lowering of the standard, which I regard as a very serious matter. I believe this question was discussed by our own Board, and a statement was laid on the table showing that these uncertificated teachers had done remarkably good work.

106. I gathered from your remarks on the subject of examination that you would not be in favour of the accrediting system by which the headmaster of a primary school could pick out certain pupils as being efficient, and allow them to pass on to the secondary schools without examination?—I think there ought to be an examination at the leaving at every stage for the primary and secondary schools, just as there is for the University.

107. Do you think the kindergarten system should be incorporated with the public-school system of the Dominion?—Yes, I think there should be a kindergarten in connection with every large public school.

108. *Mr. Thomson.*] Is it not a fact that sometimes you will get a teacher of high academic standing who will not do as good work as a teacher of very low academic standing, but who is a born teacher?—That sometimes happens, but I think it is exceptional. There might be some way of opening the door for them, but I think the existence of uncertificated blackblocks teachers or of any teachers at all is a thing we ought not to have. It is an anomaly in our system.

109. You think facilities should be afforded to enable these men and women to obtain these D certificates?—I think so. If they are in the service I think they are entitled to some consideration.

110. *The Chairman.*] You admit the training colleges at present are unable to turn out certificated teachers sufficient for requirements?—Yes.

111. How long do you think it will take to overcome this deficiency?—I have no idea. It has arisen largely because a more generous staffing was allowed to the schools, and the substitution of teachers for pupil-teachers, and, I suppose, by the increase in the number of schools. But I cannot think it will go on indefinitely; it is only a temporary trouble. You have at least fifty teachers being turned out of each training college every year, which means two hundred a year, not reckoning the leakage by retirements, deaths, and so on.

112. *Mr. Hogben.*] In regard to nature-study, I understand you would not start with the object, but with the reading-book?—Yes, but I must have the object as well. I would not give a nature-study lesson unless I had the object before me.

113. Then, you would not do as they do in the German and French schools—take subjects which are not found in the reading-books, but which the children can observe themselves—some natural object which they are trained to observe, and about which they are asked questions?—The objection generally to it is that they are allowed to take a little biology and botany and geology, and a little of everything here and there, until really I wish the word had never appeared in our programmes. It is just doing as much harm to practical education now as the word "nature" did in Rousseau's time. Nobody knows what the word means, or everybody has a different meaning for it.

114. In science?—Science is not dealt with in quite the same way in text-books as a rule now. I have looked over lots of programmes of work to see what I could get in science, but there is not much in the text-books as constructed at the present time. We ought to have a little more information in regard to some things, but my opinion is that fourteen years of age is about the time to begin science-teaching. I would let the high schools do the work in science. I do not think we would lose anything by it.

115. Do you not think it is natural for a young child to observe all there is about him?—I would like to get some definition of what "observing" means before I answer. I am not sure that children are so very fond of running streams, and stones, and flowers, and animals as they are supposed to be. I am rather inclined to think that is a manlike view of the subject. I think children are vastly more interested in subjects concerning the imagination—stories, and literature of that kind. Of course, the best of all methods must be observation; but in regard to observation in nature-study lessons as I see them pursued, I feel that perhaps nowadays we are emphasizing this aspect of education—observation—to the neglect of what is really the highest faculty at that period—namely, training the memory.

116. You can train the memory?—I think you can improve the memory: that is my impression. As there is such a difference of opinion about a subject of this kind, we ought to know better where we stand before it appears as a primary-school subject.

117. You say you would not teach history in the Third Standard: I take it you mean you would not teach any of the civics you mention, but you would not exclude historical stories from the English?—My method is always to begin with biographies and stories.

118. You would not prevent a teacher in the Third Standard allowing his class to read stories?—Certainly not. It was civics I referred to particularly there.

119. With regard to small schools, do you not think there is a fear that if we were to give a higher salary in schools of Grade 0, we will say, than we are giving now, we would increase the number of such schools very largely?—Why should they be increased? I cannot see any reason for it when you consider the social and other disadvantages which are implied in going into the country to small schools with an attendance of from one to eight.

120. Would not the tendency be to establish three schools of eight rather than one school of twenty-four?—I do not know whether it would have that effect, but when I said we should increase the salaries at small schools I was not thinking of Grade 0 schools. I was thinking of sole-teacher schools.

121. Of from nine to thirty-five in attendance?—Yes.

122. And you would increase these salaries?—I think so.

123. *The Chairman.*] We have had the suggestion made that the local authority of each education district should control the primary, secondary, and technical education of that district: do you favour or disfavour that?—I do not favour that. I think that as a general principle the more local autonomous government you can have the better it is for the country and its administration. I think you get better administration, greater interest, and greater efficiency in administration the more you increase the local administration. I do not believe in centralization, and that would be a form of centralization. I think you get better administration when you have a Technical School Board with its specific functions, and a School Committee with its specific functions, providing that the administration is not too costly.

124. Does a multiplicity of Boards conduce either to efficiency or economy of administration?—I do not suppose it conduces to economy.

125. You laid considerable stress on the ill payment in certain grades of schools: would it not be an encouragement to the teaching profession and bring in young men and women if they knew it would be possible for them, under one controlling authority of this kind, to fill any of the positions in these several classes of schools?—I do not see in what way the existence of these separate Boards interferes now with the promotion you speak of.

126. Is it a fact that a teacher who has the advantage of having been trained in the primary-school course gets the same opportunity in a secondary school as the man without it?—No, I think that in the appointments in the past the fact that students have been trained in the college has not received sufficient weight. I think there is a kind of tradition in high schools—if I am right in saying so—that they must look to the most brilliant university man to some extent in their appointments. That may be necessary for the head of the school, but for the assistants I do not know how it has worked out. I have seen occasional instances of it, but I have not seen very much to warrant me in saying that well-trained primary-school teachers would not be appointed to secondary schools—in fact, I could name a dozen who are in our secondary schools.

127. A secondary-school teacher who has had the advantage of a thorough primary-school training would be a distinct acquisition to a secondary-school staff?—I believe that is right, but I do not quite see what connection there is. The suggestion before the Commission is that Education Boards might undertake all these duties. I think they would have far too much to do to do it thoroughly.

128. Do you know that an Education Board in this Dominion does administer these different branches of education, and, it is claimed, administers them well?—I have not heard of it. That is a matter of experience.

129. In regard to the issue of these teachers' regulations, as the head of the Training College, do you not think it would be much better if, before these regulations are promulgated, those who have to administer them should be consulted in regard to them, and should have a prior knowledge of what is intended?—Yes. I was very much surprised when they were issued—in fact, I was indebted to other people for a copy of the regulations. One wishes to be perfectly fair to the Department, and I will say that these subjects had been discussed in Wellington previously, but they were very superficially discussed; and I do not think a document of that kind ought to have been sent round to training colleges—to myself, without my having had an opportunity to say something in regard to the wisdom of some of them. I think the Department ought to fully consider any new departure in this direction with all those concerned. I may say that I have not yet made any recommendation to the Department in regard to these regulations or any others that the Department has not always given the fullest consideration to.

130. Would it be to the advantage of national education if a Council of Education were set up for the Dominion which would possibly produce a continuity of policy and uniformity of interpretation?—Yes, I think a Council of Education would be most desirable, for this reason: the tendency of all Departments—education and everything else—is to take power to themselves. I think in any conference that is held between Inspectors and teachers there ought always to be an equal number of teachers with Inspectors. A conference that is wholly Inspectors may or may not be dominated by the officers of the Department.

131. Is that your experience after attending any such conference?—I have had that impression—that the heads of Department who were sitting at that table exercised more than an individual vote at that table.

132. *Mr. Pirani.*] Do you think it would be better in connection with these conferences if at certain periods of the conference the discussion and consideration were carried on in the absence of all official representatives?—I do.

133. *The Chairman.*] As one who has taken part in these conferences, you think that the absence of the element Mr. Pirani has referred to would have the effect of promoting a fuller and freer discussion than would be obtainable otherwise?—I have had the feeling in regard to certain subjects that if the Inspectors themselves had discussed the matter without knowing the mind of the Department beforehand their decision might have been something different.

PETER GOYEN examined on oath. (No. 33.)

1. *The Chairman.*] You were Chief Inspector of Schools for the Otago District for many years?—I was in the service of the Board as Inspector and Chief Inspector from 1882 to 1910, when I retired on superannuation. I wish to mention the following matters bearing on topics contained in the order of reference. I wish to begin by submitting some statistics compiled from departmental returns. In the first set, column A shows to the nearest £1,000 the income of Education Boards for the years 1900–1910, and column B the approximate rate per cent. of increase on the income of the preceding year.

Year.	A.	B.
1900	£502,000	...
1901	£533,000	5·8 per cent.
1902	£586,000	9·9 ,,
1903	£608,000	3·8 ,,
1904	£632,000	3·9 ,,
1905	£679,000	7 ,,
1906	£846,000	24·6 ,,
1907	£848,000	0·2 ,,
1908	£917,000	8 ,,
1909	£949,000	3·5 ,,
1910	£995,000	4·8 ,,

The rate of increase for the period is 98 per cent., or an average of 9·8 per cent. per year. Number of pupils for the year 1900, 130,724; number of pupils for the year 1910, 156,324: increase for the period, 25,600: percentage of increase for the period, 19·6. Approximate cost per pupil for 1900 and 1910: 1900, £3 16s. 9d.; 1910, £6 7s. 3d.: increase per cent. for the period, 65·7. Hence the ratio of the increase in income to the increase in the number of pupils is, roughly, as 10 to 3. Cost of management of Education Boards, including cost of inspection and examination: 1900, £29,231; 1910, £41,395: increase, £12,164: increase per cent., 41·6. Cost of buildings: 1900, £51,806; 1910, £136,716: increase, £84,910: increase per cent., 163·9. Salaries of teachers and of pupil-teachers (with allowances for lodging) and grants to Committees: 1900, £401,977; 1910, £650,899: increase, £248,922: percentage of increase for the period, 61·9. Cost per pupil on this basis: 1900, £3 1s. 6d.; 1910, £4 3s. 3d.: increase per cent. for the period, 35·4. The foregoing statistics show a large increase in the cost of education during the decade to which they refer, and I regret to say that, as far as my experience goes, increase in educational efficiency has not been commensurate with increase in cost. There has certainly been great improvement in drawing and other hand-work, and school life has been made easier and pleasanter, but as certainly there has been decline in English, geography, and history—in English decline in knowledge of the function of words and of sentence-structure, and in geography and history decline in knowledge of facts and their relation. Cost per head of population of all departments of education in the Dominion for the year 1910: primary, 17s. 6d.; secondary, 2s. 5d.; technical and continuation, 1s. 1d.; higher (university), 1s. 1d.; total, £1 2s. 1d. Far be it from me to suggest that we spend too much on education, but I do suggest that the Dominion does not receive an adequate return for what it spends. This is, I think, owing partly to unnecessary multiplication of governing bodies, partly to pressure exercised upon the Department by these bodies for grants for expensive buildings and equipment that under a single management would in large measure be unnecessary, and partly to the circumstance that, owing to the indifference of many parents, we do not get out of the machinery so liberally provided by the Treasury what we ought to get out of it. Other causes will appear as I proceed. Obviously the multiplication of governing bodies does not make for economy, for offices have to be paid for and officers paid (the cost of offices and officers for secondary schools in 1910 was £3,519); and, since these bodies work independently, there is little care taken to prevent overlapping in subjects taught in the same area. In Dunedin, for example, most of the subjects taught in the day Technical School and the high schools are identical and could be taught in the same school; and in my opinion there is no subject taught in the day Technical School for which adequate provision could not be made in the high schools. I do not doubt that, if the Education Board had been the sole controlling authority here, provision for all that is taught in the day Technical School would have been made in the high schools. Precisely what occurs in Dunedin occurs in the other large centres in the Dominion, involving, I think, waste both of money and of energy. Again, at the end of 1908 first-year pupils at the secondary schools numbered 1,648, and at the end of 1909 second-year pupils numbered 1,217—that is, of the first-year pupils 1,217 completed the second year's course; hence 431, or 26 per cent., of them took only a part of it. The average cost per pupil at the secondary schools is about £11 (slightly over). The cost to the Dominion of these 431 pupils for the first year was therefore £4,741, most of which was, in my view, pure waste; for most of them might with as much profit have spent the time at the primary schools if these were so organized as to provide for the continuance of the education of boys and girls who, after winning their certificate of proficiency, do not intend to complete a two-years course at a secondary school. At the end of 1909 first-year pupils at the secondary schools numbered 1,931, and at the end of 1910 second-year pupils numbered 1,404—that is, of the first-year pupils 1,404 completed the second year's course; hence 505, or 27 per cent., of them took only a part of the second year's course. The cost of them to the Dominion for the first year was £5,555, which with £4,741 makes a total of £10,296 spent in two years on pupils that failed to complete a two-years course. There appears to be similar leakage in the day technical schools, for, according to the only return I have been able to find, first-year pupils numbered 736, while second-year pupils numbered only 287. I may here refer to another leakage, one that involves waste not of money, but of national, moral, and mental efficiency—I mean the leakage of children between S4 and S6. Between S4 and S5 there is a leakage of about 19 per cent., and between S5 and S6 a leakage of about 32 per cent.—that is, about 19 per cent. of the children who complete the course prescribed for S4 do not complete that prescribed for S5, and about 32 per cent. of those who complete the course prescribed for S5 do not complete that prescribed for S6. In my judgment there is also waste of money on manual work in primary schools, especially on paper-folding and brushwork. The materials for the latter are costly, and blobbing with brush and colours does not, I think, give to hand and eye so good a training in accurate observation and expression as does drawing with the pencil from nature. Paper-folding is useful chiefly for the purpose of giving elementary notions of plain geometry (lines, angles, surfaces), and should not be taken earlier than S3, to be followed in S4 by card-board-work to give elementary notions of solid geometry. This, with scale-drawing, would lay a good foundation for woodwork and mensuration in S5 and S6. The removal of paper-folding and brushwork from the junior classes would enable the teachers to give more time to English, including recitation, story-telling, and well-toned and well-articulated speech; and if in addition the statutory school day for Class P were reduced to three hours, the teachers would be set free to teach the senior girls needlework and domestic economy. The normal school day for all the standard classes is five hours, hence the arrangement suggested above would enable the teachers of Class P to give nearly two hours a day to work that is of great importance to the senior girls. There is waste, too, in the employment of itinerant teachers to teach special subjects. By this time the training colleges should have prepared a sufficient number of teachers qualified to teach these subjects in all the schools in which they are needed. Lastly, there is to my mind

waste of money in the employment of special Inspectors to inspect and report on the manual work of the primary schools and the management and teaching of the secondary work in the district high schools, for all this work is done by the Board's Inspectors, and does not need repetition by departmental Inspectors. The aim of education is training for efficient citizenship—that is, training for the efficient discharge of the duties imposed by universal suffrage and the demands of efficient industry. This training cannot be achieved between the ages of six or seven and fourteen, and the attempt to achieve it within this period has everywhere resulted in overcrowded syllabuses—syllabuses based on the assumption that it is possible to turn out boys and girls of thirteen or fourteen yeahs of age with the mental and moral equipment for the citizenship of adults. It is, of course, felt that if this subject or that is not studied within the primary-school period the child will remain ignorant of it for the rest of his life. The aim is praiseworthy, but, unfortunately, from lack of time and immaturity of intellect to realize the aim, only a smattering of the work mapped out is achievable. Thoroughness is the touchstone of education, and thoroughness is impracticable with most present-day syllabuses. The aim of a primary-school syllabus should be not to provide for vocational instruction, but to lay a good foundation for the years of mental and physical development that takes place between the years of fourteen and seventeen or eighteen, and for this adequate provision has not yet been made in New Zealand. At the most critical period of life, at the time when their education is beginning to operate most efficiently, and the continuance of mental, moral, and physical discipline is all-important to their future and to the future efficiency of the nation, thousands of boys and girls of the towns and cities year by year pass from the discipline of the schools to a world where, when they are not at work, they loaf about learning little that is elevating and much that is degrading to character, and soon forget what they learnt at school except writing and the mechanical parts of reading and arithmetic. With this serious leakage of acquired efficiency, are we deriving an adequate return for our large expenditure on education? I think not. I would therefore urge upon the Commission the necessity for establishing in towns and cities continuation schools at which attendance should be compulsory to the age of seventeen or eighteen. The amended Education Act gives power to School Committees to establish such classes; it ought to have given the power not to Committees, but to Education Boards. Though the syllabus ignores English grammar as such, I should find little fault with the work placed under the heading of composition if the Department's suggestions as to how what is thereunder prescribed should be done, were deleted from the syllabus. It is because these suggestions encourage superficial and rule-of-thumb treatment of what is of great importance in composition, and especially in the interpretation of English, that I consider them harmful to sound teaching. As my books on English show, I am entirely opposed to dry-as-dust parsing and refined analysis; but I do think that the pupils of primary schools should be taught to classify according to function the words, phrases, clauses, and sentences of English speech, and should learn from this instruction the laws that govern English sentence-structure. In other words, they should be taught the syntax of the language, and the syntax cannot be intelligently taught apart from the classification of the elements of expression. I know from experience that this important work is not beyond the power of the average boy or girl of twelve to fourteen years of age, and I will add that I have little respect for the teaching-power of the man who is unable to make it interesting to his pupils. The course of arithmetic I regard as an excellent one. I think, however, that we might with profit to the pupils add to the prescription of work for S6 sufficient algebra to enable them to solve easy simple equations, and sufficient practical geometry to enable them to draw to scale accurate figures in mensuration-work. With regard to geography, I wish to say that from the wide field of good matter mapped out in the syllabus any intelligent and experienced teacher should be able to draw up an excellent scheme of work for his school if he were allowed to select from the mathematical matter just what he considers his pupils capable of understanding and assimilating. I have already said that during recent years there has been decline in geography in our schools. I now add that in my opinion this decline is due not to the actual syllabus of work, but to two sentences in Regulation 42, page 30. They are: "The requirements for this part of the geography (Course B) may be satisfied by the use of geographical readers, prescribed and approved by the Minister of Education, if the reading-lessons are explained fully by the aid of maps, and, where possible, of pictures and other accessories." "In the course of the lessons many names of places will be naturally introduced in order to illustrate the principle which it is sought to establish, but it is not intended that the lessons should be used as an exercise of memory." These sentences imply and are interpreted by teachers to mean that the storing of the facts and their explanation in the mind of the pupil is not the chief aim of the study; they lay great stress on the work of the teacher and little on that of the child, which is an entire reversal of the canons of sound educational method. Certainly, it is the teacher's work to explain when explanation is necessary, but as certainly it is the work of the child to store the explanation. Contempt for memory does not make for efficiency in education. It is not true that the teacher has taught when he has spoken, nor that the pupil has learnt when he has heard. History is another subject in which the schools have gone back during recent years, a result that I attribute to two causes: (1) that the subject is not compulsory for the teacher's certificate, and is therefore not known as it ought to be known by teachers, and (2) that it is placed among the optional subjects of the school course, with the advice that "The requirements of this subject shall be held to be satisfied by the use of reading-books embracing the topics named, if explanation of and questions on the subject-matter form part of the lessons in connection with these reading-books." Here, again, little stress is laid on the storing of the facts and explanations: the teacher does the work, and the pupil listens passively or actively according to his mood at the time. I am entirely in favour of nature-study, which has been a joy to me during most of my life; but the nature-study that obtains in most of the schools with which I am familiar is a very mediocre instrument of culture, and it is so because few teachers

are trained students of nature. Plants and animals, with their marvellous adaptations to their environment, are among the most interesting things in nature, but the teacher who is without eyes to see what there is of interest in them cannot give to his pupils eyes to see it. Moreover, the examination and dissection of plants and animals in the schoolroom is a very poor substitute for the study of them as living things in field and farmyard, and for this kind of study adequate provision has not been made in the training course for teachers. When the present course was about to be inaugurated I submitted to the Department the outline of a course of field-work for trainees, but it was rejected. In my judgment English alone of all the subjects of the training course should be placed before this out-of-door study of nature, and I will add that the best English literature cannot be fully appreciated without a knowledge of nature as she presents herself out of doors. Teachers of rural schools need to be learned, not in Latin and mathematics and theories of psychology, but in English and the book of nature; and to my thinking no teacher's training course is satisfactory that does not put these two in the forefront of study. It is, I think, a distinct loss to primary education that in training colleges degree-work should be placed before the essential equipment for the teaching of the subjects of the primary school. As to instruction in agriculture, I am of opinion that in the primary school we should not go beyond the work that arises out of nature-study and the proper working of the school-garden. This is all that is attempted in the primary schools of Denmark, which in farming and dairy-work is easily first in the world. There is just one other observation I wish to make, and it is this: the classes in city and suburban schools are much too large. It is impossible for a single teacher to do justice to sixty or seventy pupils of unequal acquirements and of greatly varying natural ability. To the existence of these huge classes much more than to anything else is due the circumstance that clever pupils do not obtain the certificate of proficiency and pass to the secondary schools at a lower age. The remedy is obvious.

2. *Mr. Pirani.*] Do you not think it possible to make a much better classification of the pupils, say, above the Fourth Standard in the primary schools, so that the clever pupils would not be kept too much in touch with the duller pupils?—Yes, I think the large classes should be divided into two, each under a separate teacher. It does not take long for a man to discover who are the able ones and who are those with a weaker equipment. The brighter ones, I think, should then be placed in a senior division, and taught separately from those who require a good deal of spoon-feeding. A large proportion of every class gets practically none at all, and is all the better for not having it.

3. *Mr. Davidson.*] With regard to the sole-teacher schools, it has been suggested to this Commission that, instead of giving an assistant when the attendance is between thirty-six and eighty, some kind of assistance should be given when the average attendance is between thirty and fifty, and that the assistant should be a probationer or a pupil-teacher, dispensing with the full assistant until fifty is reached. Do you think that a good idea?—No, I do not think that would do.

4. If some such assistance could be given between thirty and, say, forty or fifty, would that not afford an opportunity to many country boys and girls leaving our district high schools to get into the sole-teacher schools for two or three years, and would that not provide a larger supply of a desirable class of students for our training colleges?—I think that would be a good idea myself. I must confess I have myself condemned the pupil-teacher system, but in recent years I have come to realize my mistake. I think the pupil-teacher system fed the adult staff in a way it is not being fed now. A pupil-teacher who had worked for four years under a competent head master or mistress could at the end of his course manage a class very well, and if he had an opportunity of extending his training course as you suggest for another two years, at the outside, I think it would be an excellent means of adding material for the training college, and, of course, for the schools.

5. Do you think such teachers would be better equipped for our country schools and sole-teacher schools from the fact of their having had experience in such schools at the earlier age?—Yes, early experience in the country schools would be of great advantage to them, undoubtedly.

6. Do you think they would be more content to go into the country, and that, knowing the conditions, they would be more efficient?—Yes; that is one reason why I have myself always tried to select where possible candidates for the positions, even in Dunedin, with that end in view. I knew it must operate beneficially in the end.

7. Then, if from the district high schools you could get candidates who had passed the Civil Service Examination you would approve of such candidates being placed in those schools of an average attendance of between thirty and forty for two or three years before entering a training college?—Yes, I think that might operate very well. There is one thing that is very necessary if our staff is to be kept up. I notice the Education Boards are in difficulties owing to want of applicants for certain positions. Now, one of our aims ought to be, of course, to provide from amongst ourselves a sufficient number of qualified teachers to fill those gaps. If you extend your training course over three years you cannot do it, whereas if you limit it in a measure, say, to two years, you might very soon fill up the gaps that have been made.

8. What is your opinion as to the value of manual training such as paper-folding, brush-work, and drawing?—I have not said anything about that so far because it seems to me that this blobbing with the brush has nothing to do with nature at all except as regards colours. What is done by the pupils now is just about as much unlike anything in nature as one can imagine. Accurate drawing with the pencil, on the other hand, is very fine training.

9. Then, you do not think this manual training is justified by results?—No. Paper-folding, of course, is nice employment for the young children, but it seems to me its real value would come in when they are gaining some knowledge of plain geometry. Paper-work then would be a most useful adjunct. The cardboard-work would lay a most useful foundation for mensuration. I think myself mensuration ought to be carried a good deal further than it is at present.

10. Do you think the students in the Training College set more value upon their university work than upon the training for their life work in the primary schools?—I cannot help having the feeling that the chief aim in the Training College is to get on with university work. I am not very familiar with what goes on, and I can only judge from final results. I think a man ought to be well educated to be a teacher. Above all things, I think he ought to be well educated in English—highly skilled in the interpretation of the language—the imaginative part of the language. That is where the literary part lies. He should also be well trained in ordinary arithmetic, geometry, and algebra, but he would not want this superfluity in this department that is aimed at in university work.

11. *Mr. Thomson.*] Do you believe there should be a review of the syllabus with a view to concentration of effort on essentials?—That is the meaning of what I have already said. I do not think we should spend quite so much time on several other things I mentioned this morning.

12. *Mr. Poland.*] With regard to the grading of teachers, I dare say you know the system that is in vogue in Auckland and Wanganui. Speaking generally, do you approve of such a system?—I dare say the system ought to work out very well, but I have always had rather a dread of systems, because they become so mechanical. I do not believe in over-systematizing. I do not know the details of the schemes in the North: I only know in a general sort of way. It seems to me that the plan adopted by the Otago people is not altogether a bad one. It is this: First of all, there is the published classification of the Department, which is, of course, the result of marks assigned by the Inspectors. That indicates the judgment of the various district Inspectors as to the qualifications of the several teachers. Then, when the Board is about to make appointments, the list of applicants is handed to the Inspector. The Inspector goes through it and places those whom he considers fit for the positions in order of merit. The Board then acts on the information supplied by the Inspector. I do not, however, see how a national scheme could be managed in that way. Inspectors vary very much as regards attainments, knowledge of the work and of the cost of it, and because one Inspector gives a man certain marks it does not follow that another Inspector would give that student the same marks. For that reason I think a national scheme on those lines would be very difficult.

13. Do you believe the School Committees should have the right to select the teacher from the number of names sent forward by the Board of Education?—No; I have seen many evils result from that.

14. You think the Board, on the recommendation of the Inspector, should make the appointment?—I think when the Inspectors deliberately say, "This man is the best in the list, another man next, and another man next," and so on, the man at the top ought to get the position, and not the man at the bottom. Even in our district the man at the bottom gets the post sometimes, and the man at the top is left out. I think the Committees have too much power, myself.

15. You have had a long experience here as an Inspector with regard to scholarships: what are your views with regard to scholarships?—I think there should be no scholarships between the ages of fourteen and sixteen. I think the free-place system makes ample provisions for those young people. I think we can assume that boys and girls can be of very little use outside until they are sixteen years of age, and I would reserve the scholarships for boys and girls over sixteen years of age. That would be of great advantage to poor people who at that stage of their children's career would benefit by what those children can earn.

16. *Mr. Kirk.*] Speaking generally, do you concur in the statement that is made that the children now are overexamined?—I do not believe it at all. I think it is a sort of appeal to the multitude. It is an absurd statement coming from an educationist.

17. You have not seen any detrimental results, physical or otherwise, from the examinations you have supervised?—None whatever. I have seen a great deal of good.

18. *Mr. Hogben.*] What age do you refer to?—I have been thinking for the most part of the children of the primary schools, but I also had in my mind others whom I have from time to time examined—pupils of secondary schools, pupil-teachers, and so on.

19. *Mr. Kirk.*] You have frequently visited the school buildings in this district over a great number of years: what have you to say as to the general construction and style of the buildings—are the necessary provisions made for proper ventilation and the other essentials from a health point of view?—I think ample provision is generally made, but I also know the teachers do not utilize what is provided for them. It has been my misfortune many a time to find the windows closed and the air stuffy. There is plenty of ventilation if it is regulated, but when teachers will not take advantage of the ventilation what are you to do?

20. Do you see any objection to teaching boys and girls in the same classes?—None whatever with regard to primary schools. I think up to a certain age they should be taken together; after that I would separate them. In primary-school work up to the Sixth Standard I have seen no evils arising from it. On the other hand, I have seen much good.

21. Am I right in assuming from your remarks that you think primary and secondary education could well be under the charge of one body?—Yes, and technical as well. It would tend to prevent this overlapping. I suppose three-fifths of the work is common to the secondary schools and the technical schools.

22. Would you include the University as well?—No, I do not think the Board should have anything to do with the University.

23. You think, then, that the control of the primary, secondary, and technical schools should be in charge of one body only?—Yes.

24. *Mr. Wells.*] Has it ever come within the knowledge of the Inspectors that teachers who have been placed in the top grade have relaxed in effort and have become less efficient than they were?—I am sorry to say "Yes" to that question.

25. Then the graded list does not afford altogether a satisfactory basis?—Precisely. The difficulty is to find a proper basis.

26. When you referred to the applications being referred to the Inspector did you mean that they were referred to the Chief Inspector or to the Inspectors as a body?—They are referred to the Inspectors, and the Inspectors do not forget the fact you mentioned just now in assigning the positions in their lists.

27. These applications have continually to be considered, I presume?—Yes.

28. Are not the Inspectors usually scattered over the country?—No, the applications are considered at the monthly meetings of the Board. If the meetings occur more frequently it is always arranged that the Inspectors shall be here. Almost all the year round four are here. Only on one or two occasions have we had as few as three of them here.

29. Suppose the teachers were considered by the Inspectors sitting as a Board once a year or once in two years, and the qualifications and work carefully considered and weighed against one another, would it not be possible to draw up a list in order of merit which would be of greater assistance than what you have now?—I dare say it would, but it would mean an infinite amount of trouble, because it would mean, amongst other things, that those who had somewhat declined during the year would have to be put down. I should not like to undertake it myself.

30. Still, it might lead to reward of merit?—I think, so far as districts are concerned, merit is thoroughly recognized, because things are considered every month for the Board's information, and the best man comes to the top.

31. Have you ever in your experience known the Board to make any alteration in the order suggested by the Inspectors?—On one or two occasions I have, but, as a rule, the Board does not make any change.

32. Anything of that sort must have a very discouraging and damaging effect upon the profession?—Yes, it must have. I think, myself, it should be left to the Inspectors, and they should be made responsible. But the thing is so seldom done here that it is hardly worth mentioning.

33. You spoke of the large number of education districts—thirteen in all—as being a drawback. What would you consider a reasonable number?—I do not know the country sufficiently well to give a judgment, but it has always seemed to me that the schools on the west coast might be connected with those on the east coast: for example, I think Canterbury might include a part of Westland. Then, South Canterbury seems to me to be too small a district: it could be included in Canterbury or Otago. It does seem to me that thirteen education districts for a little country like New Zealand is altogether more than is necessary.

34. There are at present three term examinations in the year which the head teacher has to conduct. Do you think they might be reduced to two with advantage?—For my part I would examine three times a year. Certainly they are not overexamined in our schools nowadays.

35. You spoke of continuation classes and making the attendance compulsory. Do you think public opinion would support you there?—I think something more might be done than has been attempted. Public opinion has not been tested, and the amended Act is practically a dead-letter, because no one has attempted to carry it out. I am not sure that it will be carried out. It certainly will not be carried out by Committees.

36. Do you think any economy could be effected by centralizing as regards the country schools?—It depends entirely upon the character of the country. Otago is so hilly that it would be very difficult to do it here. I can imagine it would work very well in Canterbury, north and south, and in some parts of Auckland. I am strongly in favour of the idea, given favourable conditions.

37. Do you consider the salaries paid to assistants in the district high schools are sufficient?—They have not seemed to me quite what they should be. Of course, some of the assistants sent there are inexperienced, and are not worth more than they get. On the other hand, there are some worth a great deal more than they get. I think, if you get experienced men for that kind of work they should be paid not less than £300. I do not know exactly what the salaries are now.

38. *Mr. Pirani.*] With regard to the classification of teachers, do you think it would be possible to classify teachers under a system something like this [produced]? There are a hundred marks given, and it is divided up into so-many marks for different qualifications?—Under the old scheme adopted by the Department those headings did not appear, and yet those things were always taken into consideration when the marks were assigned, such as personality, attention to environment, to discipline, organization, and so on. It is difficult, of course, to assign marks for personality. I should judge personality from the atmosphere the teacher created in his school.

39. If a system of this kind were introduced and regular marks assigned under each heading, would it not give an opportunity to the teacher to make up his deficiencies in these special respects?—I think so. If he knew in which respect he fell short he would be likely to make a special effort to qualify in that direction. It might be a good thing for a number of teachers to know under what heading their qualifications were judged.

40. You consider the enforcement of compulsory attendance at continuation classes is mistakenly left in the hands of Committees. Is it not that the request has first to come from the Committees for the enforcement—the initiative lies with them?—No.

41. Are you not aware that in Wanganui District something like ten Committees have already asked the Board to bring compulsory continuation classes into effect?—I have heard the Committees have met, but has the Board done it?

42. Then you are not aware that the Wanganui Board has already compulsory attendance at continuation classes in operation?—No.

43. Are you aware the Minister has already recognized the regulations under which that enforced attendance has been brought about?—No. It seems to me the people in the locality would object, and the members of the Committees do not like to incur any hostility. I should say the Board should get the consent of the Committee.

44. As a matter of fact, under the Act the Committee must first ask for the continuation classes to be compulsorily attended, but there is nothing in the Act to prevent the Board from going to the Committee and proposing this compulsory attendance, and if then the Committee expresses its willingness, would it not have equal legal force?—Yes, I think it should begin with the Board and proceed in that way.

45. *Mr. Wells.*] Do you consider that in rapidly growing districts additional assistance is given quickly enough?—No. I do not know what is done at present, as I have been out of office for some time, but I feel sure the teachers have frequently to wait too long before they get assistance.

46. You think it would be an improvement in the case of schools where the attendance is rapidly growing if additional help were given at once on the certificate of the Inspector that he considers the attendance is going to last?—Yes, I think the Board ought to have power to do that on the recommendation of the Inspector.

47. In the case of a teacher of a large school who has outlived his best work, do you think it should be made possible for him to take a less onerous position without interfering with his superannuation?—I should like to see something of that sort. There are some men who wear out young. They do excellent work up to, say, forty or fifty, and I think they deserve such consideration for that work.

48. *Mr. Hogben.*] Would you make the school reading-book the starting-point in nature-study?—No, I do not think we want any study from the reading-book. Having done such a lot of field-work myself I know how the thing grows upon one. One sees little at first, but gradually begins to see more and more. There is nothing like going straight to nature. There is no system in it so far as the child is concerned, but the teacher has his system all the same. The eye needs training as well as the hand. The chief aim is to create a love for the beautiful things of nature.

49. Would you object to brush-drawing if the brush were used for the same purpose as the pencil—namely, to represent natural objects?—I should not then have the same objection to it.

50. Do you not think it is a good idea to train the colour-sense of the child?—I do not think colour-sense can be well trained in that way. I think they should be taken amongst the plants and the colours of nature. That is the place to study colours.

51. Do you not think the reproduction of the colours assists greatly in the creation of the colour-sense?—I think the closer you get to nature the more you will see.

52. You have taken a great interest in the establishment of school libraries. Do you favour the extension of that principle—the establishment of libraries for the several classes of the schools?—Yes, that was my object when I began the work here, and in order that the teachers might have as little trouble as possible in selecting suitable books I drew up a circular and a catalogue. It provides books suitable for very little children and right through the school. I need hardly say I lay great stress on reading, with understanding, of course. The habit of reading is an important thing. That is what I would like to see inculcated. I think that one of the most disappointing things in connection with education, not only in New Zealand, but elsewhere, is that it does not seem to develop a taste for reading. It does not develop the habit of reading.

53. Then, having intimated that you are in agreement to hand over to the constituted authority the control of primary, secondary, and technical education, does that assume in your mind the continuance of the present system of election, or have you given any consideration to that question?—I think we should need to make the Boards a little larger, so as to have suitable Committees. I am not sure that the Boards should be elected as they are now. I think it is very important, when there are two or three classes of schools under the same Board, that there ought to be on the Board some specialists, and therefore I should say the Government ought to be allowed to nominate certain members of that Board.

54. Are you acquainted with the system in England known as "co-option"—that is, the authority can nominate to the position men of training and men who have given special study to these phases of education? With the adoption of that system, do you not think that a class of men who do not offer themselves for election would be available?—Certainly. I should not offer my services under a system of election at all, but if I was asked by a competent authority to sit on such a Board I should do so.

ANGUS MARSHALL examined on oath. (No. 34.)

1. *The Chairman.*] What is your position?—I am at present Director of the Dunedin Technical School. I had two years' experience in the Training College as a teacher, I have been sole teacher of a country school, headmaster of two-teacher schools, first assistant of a district high school, and several grades of assistantship. I was in the Normal Practising School, and afterwards headmaster of that school.

2. How long have you been Director of the Technical School?—Sixteen years. During part of that time I also held some of my other positions. I also spent several years in the University classes. I have given some consideration, since the Commission was set up, to the subjects that the Commission is called upon to deal with. The matter of the Council of Education is one of the first recommendations that should demand the attention of any Commission. I am not going into the question of the constitution of that Council, but it seems to me that with the number of educationists of great expert knowledge and experience likely to be retiring within the next few years, and others who are prepared while in public life to give their experience, members could be obtained from different parts of New Zealand with no other expense than actual travelling-expenses when going to and from the meetings. I will refer first of all to university education; and I may say that I practically owe my position to the University, and, although my remarks will only be in regard to points that require amending, it does not follow that they are the only points worthy of consideration. Some years ago it was possible for a student or teacher engaged during the day to attend the science or mathematic classes during the night. Under the present

arrangement of the time-table that is not possible. From my own department there are several students who did remarkably well in science, and were prepared to go to the University. They are employed at the Hillside Government Railway Workshops, and are debarred from pursuing their studies at the University because these classes are held during the day. I have already recommended to more than one authority that science classes, such as physics, chemistry, mathematics, might be held in alternate years at night. The remark may be made that it is outside the Government's powers of recommendation, but I notice in looking through the cost of education that the cost of higher education to the Government is £36,000 a year. It might well be made a condition of any grant that certain classes are in alternate years held in the evenings. I would go further than that. At Home for a number of years one of the conditions of appointment of a professor is that he shall give two or three popular lectures during his term of office. There is no need for me to say that the University is far removed from the popular, and I may say that the recent developments in the constitution of University Councils enables me to indicate that were some such change made in the course of information given it would do much to bring the University into line with popular requirements. It might be possible to go further and institute extension lectures. I need not enlarge upon that. It is carried on in some of the best educational countries in the world. There is also the further point of scholarships. It seems to me that scholarships are fairly well provided at present by allowing all who gain credit in the scholarship examinations free education at the University, and if there is, as seems likely to be from past discussions, any extension of that it seems to me that the standard of Matriculation Examination must be somewhat raised. There is one other point: There is a tendency to enact nowadays that very weakness that has been experienced in the past in the primary schools—namely, increase in the size of the classes. I do not wish to make any comment on the local University, but it would surprise you to know the number of students the professors are attempting to teach in the popular classes. In secondary schools, we have the high schools, strictly so called. They cost probably £75,000 a year. In regard to them, I would first of all say that, although we have many excellent teachers in those schools, there is no practical compulsion for the training of those teachers. We are met year after year with the position that primary-school pupils are not prepared for secondary-school work. The weakness appears to me to be here: the primary-school teachers carry the work of the pupil to a certain standard, and secondary-school teachers who know nothing about the primary-school teaching carry on the work without knowing the foundation, and they begin to erect a palatial building on the side of the foundation and not on the continuous structure. You will find that that is so, because in secondary schools where primary-school teachers have been successful in gaining a position the complaint is not the same. Again, in connection with the secondary schools, it should be laid down that a pupil once entering should be compelled to attend for a certain minimum period. You will find that of the pupils who enter the high schools 28 per cent. leave either during or before the end of the first year; another 28 per cent. leave during or before the end of the second year. You therefore have more than half the pupils who enter a secondary school leaving before the end of their second year. Experience shows that a pupil going to a secondary school should attend for at least three years, and there is no question about it, there is no use a pupil going to one of these schools unless he is going to attend for at least two years. I maintain that nearly a third of the money spent on secondary education returns practically very little, if any, beneficial result. I should feel inclined to say that some such system as we have tried to adopt in the technical school should be introduced—namely, the insistence of a bond or guarantee under penalty enacted from the parent of each child who enters that the child shall attend for at least two years. The syllabus of the work in the high schools has been to some extent determined by the Matriculation Examinations. One cannot blame the high or secondary schools, because after all they fulfil the functions of preparing for the University. I would also like to refer to the scholarship question. I think that we who live in the cities should leave the scholarship funds as far as possible for the benefit of those who live in the country. We have the benefit of location and position, and so on, and it seems to me that there is not sufficient to make allowance for books from the scholarship grant to country children. In regard to the Technical School, I will deal with the day school first. The great drawbcak is the dearth or scarcity of teachers or persons to give instruction in trade or mechanical classes. It is almost impossible to get any one of education or average powers of expression to explain a trade or profession they themselves know. In connection with this there seems to me to be an absence of provision for the training for commercial or domestic or general technical subjects. Of course, it is work that is in its transition stage. My remarks with regard to the high school apply also to the time that should be spent by children in the technical school. There is no use a pupil entering the day technical school course unless he is going to stay two years, and a pupil should not be admitted on any account unless a guarantee is given that he will remain at least one year. In Dunedin we get a written guarantee, and do not admit them unless they are prepared to stay at least one year, and we give them to understand that they should stay two years. With regard to the day technical schools, it seems to me that a slightly lower standard of proficiency might well be accepted for pupils, especially those taking up trade classes or domestic work. For instance, in this present year we have perhaps three or four pupils who specially distinguish themselves in hand-work and cookery. In every case those pupils hold competency certificates, or were over the age when they obtained their proficiency certificates. There is a matter in connection with the day technical schools that I do not quite appreciate. Payment is made upon the number of hours each pupil attends, while in the secondary schools payment is made on the average attendance. In the day technical school, if a pupil does not attend 800 hours payment is made on 600; if he does not attend 600 hours payment is made on 400 hours; and if he does not attend 400 hours payment is made on 200 hours. I think it would simplify the returns, and it would seem to me to be more in

accordance with the spirit of the thing, if the payment was made on the average attendance—if you like, with a minimum attendance to qualify. With regard to the evening school, there is one large class that has never, in my opinion, been provided for as it should be—namely, those who leave the primary school before passing the Sixth Standard. You will find that about 51 per cent. of those who pass the Fourth Standard never pass the Sixth Standard. What becomes of them? At present we get very few of those, and it seems to me that if we are going to have compulsory continuous education this is where we should begin. Experience proves to me that plumbers and others who come for tuition are totally unprepared simply because they have not the education. With regard to the question of trade apprenticeship, whether or not they should be compelled to take a course at the technical school, it seems to me that provision should be made that employers are bound to relieve their apprentices of their work at the end of the day and begin by giving those boys two or three hours' instruction every week of compulsory education. It may be said that this instruction should be made compulsory during the day. Apart, however, from the question of master and servant involved, you would be unable to cope with the problem if the system was started straight off. But if facilities were given for these apprentices to attend three hours a week, the time could be increased, and the compulsory classes introduced afterwards. There is a third class—namely, girls. One might say, seeing that military training is compulsory for boys, that girls should be compelled, and I think it would be wise, to spend one evening a week, between the ages of fifteen and eighteen, learning a domestic subject in the technical school. I think those who leave the primary school before they pass the Sixth Standard should be compelled to reach a certain standard before their education ceases, and certainly girls within the city boundary should be compelled to take a domestic course. With respect to the question of the Boards on control, I may say that one of the recommendations of my Board at the last meeting was that, in order to prevent any tendency of overlapping, it would be well if the various educational institutions within the city were combined under one controlling authority, but each institution to exercise control over its own schools. I do not see how you can well get away from that. The constitution of each school is different, and it is almost necessary to have specialists on the various Boards. I need not argue the point whether you can get specialists on one main Board that can govern the different institutions. Probably the experience of Christchurch, where the Museum, Library, Boys' and Girls' High Schools, and the University are all under one Board, might be an advantage, but even there they practically delegate their powers to different Committees or constituted bodies. Mention has been sometimes made that overlapping could be prevented. In my experience of primary, secondary, and technical school work I do not know that I have found overlapping to exist in the strict sense of the term. The term "overlapping" is sometimes a misnomer. It may be either revision or duplication of work. It is necessary when you take over a change of course or a school of pupils to revise on past work or consolidate to some extent, and it is impossible to prevent that there shall be some similar work in the various institutions. You must dovetail in some way. The term "overlapping" has even been used in that sense where you have to revise or lay a foundation for continuous work, and duplication does not strictly take place along the same lines. You may have commercial work, but it is carried on at a more elementary stage or with a different object in view. There are one or two other points that might be incidentally mentioned. In the country districts rural classes, such as in wool-classing, are absolutely necessary, but it has to be remembered that these classes are not required every year. The institution I am connected with has carried on rural classes in a great many centres throughout the education district, but after one or two years in these districts the number of pupils seeking instruction in one particular subject has been exhausted, and we have to wait until another generation comes on before again entering upon that subject. The same applies to tailors' cutting classes. There is no need to make the classes permanent. Two or three years afterwards there may be another set of pupils ready, and the class could be restarted. It seems to me that the recent provision of asking the secondary assistant, very often inexperienced, to undertake all the high-school work has not been an advantage to the high schools generally. I suppose there should be some limitation to the time the headmaster devotes to the secondary work, but the regulation seems to have gone to the other extreme in providing that the secondary assistant shall practically undertake all the work.

3. *Mr. Wells.*] Do you mean to say it is difficult here for a man working during the day to secure university education in the evening?—Yes, it is almost impossible for him to get to a science or a mathematics class.

4. A teacher is handicapped in attempting to take his degree?—Yes, teachers and others. Two of my young men who got 90 per cent. in a most stringent examination in physics were prepared to go to the University, and I was prepared to recommend them for free tuition, were barred from carrying out their desire because the classes were held before 5 o'clock.

5. In Auckland the whole course can be taken after 5 o'clock?—It used to be so here also.

6. The lectures in Auckland are duplicated?—It is not so here.

7. Have you any oversight of the manual work in the primary schools?—None whatever.

8. The grant for manual work does not pass through your hands?—No. The Education Board has control of the manual work in the primary schools.

9. You are not under the control of the Education Board?—Yes, but we are associated classes, with a Board of Management.

10. Do you think the time has come when masters should allow apprentices time off in the afternoon for attendance at the technical school?—I think apprentices themselves should first give some evidence that they are anxious to attend such classes. I have suggested that they should begin by attending one or two evenings in the week, and that it should be made illegal for their employers to have them working on those nights. I do not think we are in a position to provide instruction for apprentices if they asked for it during the day.

11. Have you many classes in the Technical School where identical work is done as in the High School?—I do not know of any, except perhaps mathematics and science. You must have a certain amount of that in every technical school.

12. With that exception your work is not like that carried on in the High School?—Not in the least. There is no overlapping in that respect.

13. *Mr. Thomson.*] Have you any knowledge of the working of the Council of Education in Victoria?—Not personally.

14. Have you any special reason to put forward why we should have a Council of Education?—My reasons are general. I think the work this Commission is undertaking and the experts they are examining would be met to a great extent by a commission of expert men who would discuss the point. Generally a great many subjects are discussed by institutes and training-college members which could be just as well discussed, and with more profit, by a Council of Education which could send on recommendations and confer with the Inspector-General and Minister of Education.

15. Perhaps it would be better to call it an Advisory Council?—That is so. It is only a matter of name.

16. Do you think it would be a good thing that the constitution of that Council should be such that it would consist of Inspectors of each education district in conference with the Minister of Education?—No, I am not in favour of that. I think you can still have the Inspectors' Conference and have a body of men drawn from retired Inspectors, retired teachers, and business men who have taken part on Education Boards.

17. May not such a body desire to direct the education policy in a direction that was not in accordance with popular opinion?—They would be a Board of advice, and we are not proposing to necessarily give them supreme power.

18. Do you not think that the Inspectors are more in touch with the people and the wants and requirements of each locality, and are better qualified to give advice than any one else?—I have already said that I assume the Council provided by the Inspectors' Conference will still exist—that the Conference of Inspectors will go on, in other words.

19. Do you not think that will give rise to a conflict of opinion?—No. The Minister would get expert advice from the Council, and also from the Inspectors, but he is not bound to adopt both or either.

20. You said that the matriculation standard should be raised?—Yes. What I think is this: You are going to give free education at the University, and you must have some examination, not necessarily competitive. If you are going to admit to free education all who matriculate, the present matriculation standard is not high enough, because all those who pass the examination are not always competent to go to the study of university subjects.

21. *Mr. Davidson.*] You get into your school numbers of boys and girls who have done woodwork and cookery in the primary schools?—Yes.

22. Do you frequently get boys who have not done woodwork during the primary-school course?—Yes; I suppose very nearly half of them. Perhaps a little over one-third have not done woodwork.

23. How do you find the boy who has not done manual work in the primary school compare with the boy who has?—I am not prepared to speak very definitely, but I think I can safely say there is very little difference. When we put them on woodwork it is taken up from the very beginning, and I do not think there is much difference between those who have not and those who have previously had a course of it. We begin with a new course.

24. Do you think it is unnecessary that the boys in the primary schools should do woodwork before leaving the primary schools?—It is a question of whether or not they will have an opportunity afterwards of getting the instruction. Generally speaking, I should prefer that the time given to woodwork should be devoted to mathematics and drawing. If that was the case I would be prepared to do more with them in woodwork than they are prepared to do in the year or two of training as at present.

25. If the continuation classes in the technical school were made compulsory, and boys who had a bias towards woodwork had the option of taking it up after leaving the primary school, do you think woodwork should be cut out of the primary-school syllabus?—It could be cut out from the course of pupils who will have the opportunity afterwards; but I look on woodwork as a kind of change of education. I think if pupils could possibly attend the technical school, or intend to attend, they would not lose much by omitting woodwork in the primary school and taking up drawing instead.

26. Would similar remarks apply to cookery in regard to girls? Do you find that girls who have not taken cookery in the primary schools equal to the girls who have?—No. I think some of the girls who have taken cookery have a kind of bias for it, perhaps due to the introduction of it in the primary school, and I would be in favour of extending the opportunities for doing domestic work both in the primary and secondary schools.

27. You would give every girl pupil in Standards V and VI an opportunity to take cookery during their primary-school course?—Yes. I am assuming, of course, that they get a certain amount of practical training there. I do not think that so much has been done in New Zealand as in the Australian States and America. In Victoria they cook dinners and sell them to the public. In that way the pupils get a much more thorough training in domestic work than they can under the system in vogue in New Zealand.

28. Have you many returns to make in connection with your classes in the Technical School?—I have a few returns to make, but I do not know how you could obviate that to any extent, so long as payments are made on the present basis. I may say, however, that a great part of my time is taken up by irregular attendance and watching the accuracy of the returns. It may be that

we have not got a proper system. If we were paid on the average attendance it would simplify matters. For evening classes, if a lump sum was provided for each school it would save a great deal in the way of checking returns.

29. Could you suggest any way of reducing the clerical work and simplifying those returns?—Not without an alteration in the regulations.

30. *The Chairman.*] With this suggested alteration would it be possible for the Department to get all it wants without resorting to the elaborate returns you are now called upon to furnish?—I do not think it is a fair question to ask me to amend the regulations. I believe it is possible to considerably simplify the regulations, and to trust to the authorities a little more perhaps than the Department does at present. After all, the Department has to rely on the authorities for a good deal of information, and it would be much more satisfactory if there was some other basis of arriving at the amount of capitation to which we are entitled.

31. You have suggested a course by which the payments to your institution could be altered with advantage?—I think it would be quite possible to make a considerable reduction in the returns if a little more responsibility were placed on the heads of the school, and a little more reliance upon the honesty of people. Some change is necessary before you can simplify the present returns.

32. *Mr. Pirani.*] You say it is an advantage for the girls to take cookery in the primary schools because it gives them a liking for taking the higher and further course in the Technical School. If it is an advantage for girls to do that, do you not think also it is an advantage for boys to take woodwork with the same object?—In the case of girls, they practise cookery at school, and when they go home they are interested in the subject. They are in touch with cookery at home. The same does not apply to boys. In every case it is a girl's life-work to have this training, and it is necessary, whether she likes it or not, she should take the course, of her own accord or be compelled to do so.

33. Do you not think it is an advantage to a boy for the rest of his life to be able to use a hammer and strike a nail?—I do.

34. Do you not know many grown men who can no more use a hammer than fly?—No.

35. Do you not know that instruction in woodwork includes instruction in drawing?—I do.

36. Do you not think that the instruction in drawing that is given in connection with woodwork is to an enormous extent the best instruction a boy can get?—No. He probably gets one lesson a week in drawing and woodwork combined. I maintain that were the time that is taken up in travelling to and from the woodwork class devoted to drawing, it would ultimately, as regards those boys who afterwards take up woodwork, be more beneficial.

37. Do you know how much drawing a boy at school does in the week outside the woodwork drawing—say a boy in the Fifth or Sixth Standard?—Yes. It depends on the school. Two hours and a half, probably.

38. And probably three-quarters of an hour of the woodwork time is taken up with drawing?—Yes.

39. Do you not think that should be sufficient for a boy in the week?—No. He does not get the drawing I am referring to. He is not getting that facility in the use of instruments, the quick adaptation. He would know more about actual woodwork, but in his foundation for the work, from experience, he is not so well or no better equipped.

40. What sort of drawing does he get in the primary school outside his woodwork drawing?—It is all provided for.

41. *Mr. Hogben.*] Can you suggest any basis on which a lump-sum payment to technical schools could be calculated?—Yes; I do not see why it should not be some proportionate payment according to a population basis, or the equipment provided.

42. If a district provided a very small number of classes and had a very small attendance, would you give that district a grant in accordance with its population?—I am merely suggesting that as one way of working it. I have already declined to say what the regulation should be. It is quite possible to make some payment in proportion to the number of classes. You have to provide a certain number of teachers. It does not matter whether there are only ten or there are twenty-four in a class, it is necessary to provide a teacher for two hours in the evening to teach that class. It does not matter what the size of the class is, the teacher gets the same remuneration.

43. In a case of that kind would you give a minimum number of pupils before providing a salary for a class?—Then you would have to discriminate between subjects, because in some subjects you will always have a small number of students. It is a difficult problem: I am admitting that.

44. *The Chairman.*] Do you think that the age of pupils who should compulsorily attend the continuation classes should be from fourteen to seventeen years?—It would be from the age at which they leave school up to a certain age.

45. Do you not think the school-life age is too short to enable pupils to get that fair grounding which is necessary for after-life?—I do not think there is anything like education, and from the time at which a pupil leaves school up to the age of seventeen education should continue.

46. When from 19 per cent. to 30 per cent. leave school after the Third or Fourth Standard there is evidently a leakage which should be prevented?—Yes.

47. They should either go out from the primary school with a proficiency certificate or continue from fourteen to seventeen at the continuation classes?—To seventeen or eighteen years of age.

48. Is it not a fact that voluntary classes suffer by comparison with compulsory classes all over the world?—That is so.

49. Assuming for the sake of argument that the personnel of the Council of Education were to include the Minister of Education, the Inspector-General of Schools, representatives of the several bodies who administer national education apart from the universities, plus such persons as you describe as educational experts not actively practising their profession, and such other persons as take an active interest in education and whose opinions are worth having, would not such a body be more likely to bring about continuity in policy and uniformity of regulations than the system now adopted?—Yes.

50. And, therefore, believing that such results would follow from such a course, you recommend the setting-up of such a Council?—I say I think it is an essential point in our system.

GEORGE WILLIAM CAMPBELL MACDONALD examined on oath. (No. 35.)

1. *The Chairman.*] What is your position in the service?—I am headmaster of the Macandrew Road School, and have been in the service of the Otago Education Board for twenty-five years. I was trained as a teacher in Victoria before I came here. The Otago Educational Institute set up three committees for the purpose of considering the various matters to be inquired into by the Commission, and three representatives were appointed to speak for those committees. The section I am intrusted with is that dealing with administration and finance. The first question we took up was that of the reduction of the number of Education Boards. We consider that there should be four Boards of Education for the Dominion, coterminous with the University and training college centres. Our object in advocating this is that we believe there would be great reduction in expenditure on administration. For instance, one office would do for each of these four Boards, whereas now we have a number of offices. There would be one Chief Inspector and one Secretary, whereas now we have a number of Chief Inspectors and a number of head Secretaries. In looking at the question of the reduction of the cost of administration we find from the reports that in Auckland, which is the largest district, the percentage of cost of administration of the whole is 3·9 per cent., whilst in Grey it is 7·8 per cent.—exactly double. It was considered by the committee that that pointed to the fact that cost of administration could be very much reduced by having four Boards instead of the number we have at the present time. Then, again, we considered that these Boards should control high schools, technical schools, and primary schools—the whole of the education outside the universities in the different centres. A point that influenced us considerably was that we were more likely to get a Dominion promotion scheme. There is a very strong feeling amongst the teachers that we ought to have a Dominion scheme of promotion based on lines somewhat similar to that in operation in Auckland at the present time. We know that a large number of the Board in New Zealand now are practically a close corporation: I mean that a teacher has very great difficulty in removing from one education district to another at the present time. Teachers consider that it would be of great advantage to the service if there were greater facilities for removing from the service of one Board to that of another, or from one part of New Zealand to another. Very often a teacher in Otago may find that the climate does not suit him, whereas the climate of Auckland may suit him very well. At the present time it is very difficult to get from one district to another, whereas if we had a promotion scheme for the Dominion it would be easier to interchange teachers. We think that this promotion scheme under the four Boards could be worked in this manner: the Board should consist of two Inspectors and two representatives from the teachers of each Board, presided over by the Inspector-General, and that Board should grade the teachers at certain fixed periods. Then if a teacher wished to remove from one district to another the Boards would have the grading of that teacher before them. The next point we considered was the proposed Local Government Bill, in which local rating was advocated for a number of things, and, amongst others, education. The Bill provides that the Dominion shall be divided into twenty-four districts. The opinion of the committee was that in any national scheme of education all required funds should come out of the consolidated revenue, and should not depend on the power of local rating. One of our reasons is that we think Education differs from all the other Departments. The other Departments are mainly purely commercial, whereas Education is distinctly non-commercial. We would rather see the revenue come from the consolidated revenue. Again, of course, as I have already indicated, we advocate a reduction in the number of Education Boards; but if you have the Dominion divided into twenty-four educational districts or Councils, you would, of course, increase the number of Boards, and that we think would be a weakness. The question of scholarships was the next question discussed by us, and the conclusion we came to was that all Junior National, Education Board Scholarships, and Free Place Examinations should be abolished, and the money so saved should be spent in paying the lodging-expenses of those children whom the Inspectors in conference with the head teachers consider worthy, and who require to live away from home in order to attend a secondary school. There might be some misapprehension as to that portion which says "in conference with the head teacher." We consider that under a scheme where secondary and technical schools would be under the one governing body that scholarships might be awarded in the technical as well as the secondary schools, and that so far as the hand-work classes we have now in our primary schools are concerned, the head teachers might probably be of assistance to the Inspectors in advising as to whether children were better fitted to go through a technical-school course or a high-school course. We considered another point that has already been referred to in previous evidence—namely, that there should be a minimum term of tuition at these schools and that it should be definitely defined. It is known that a number of pupils enter upon the secondary course and drop away before any real benefit seems to accrue from it. We next considered the question of free books. Whilst not in favour of free books being given to the pupils, yet, should such be thought advisable, we should recommend that the reader that forms the basis of a child's training in English should be his own property. Other readers, atlases, arithmetics, drawing-books, &c., may be supplied by the Government for use in schools

only. At the present time there is a large number of free books provided, and these books are not used. You will find a very large number stored in the schools. The children prefer to buy their own books, because then they can take them out of the schools. This seems to us quite an unnecessary expense, and useless too. I may say there was a good deal of difference of opinion in regard to free arithmetic books, but a majority was in favour of putting them on the free list. A question that the committee considered and debated for a considerable time was education in the backblocks. We strongly urge the desirability of conveying pupils in a country district to a convenient centre. We know that in other countries, especially America, a great deal has been done in this direction, and we think a great deal more could be done in New Zealand. We think that in some places where a large number of small schools have been established this duplication could have been avoided had the pupils been conveyed to a central school. In America they have special carriages for taking children to school, and really those who are so conveyed to school are far more regular in attendance and are far more safely conveyed—I mean they do not suffer during wet and inclement weather. The result is that far more efficient work is being done than ever could be obtained by means of these small schools. That seems to the committee to be one of the ways in which the backblocks difficulty to a certain extent could be overcome. Of course, you will understand that we quite realize there are certain districts where it is impossible to bring this system into operation. There always will be small schools, but we say that where the conditions are favourable this should be done. For instance, it is done at Tapanui, in Otago, where some forty pupils are conveyed daily, and it is considered by those who know the district that this could be done very well about Lawrence and near Oamaru, Maheno, and Hampden. It was considered that if this could be done in one centre it might be found there were a number of other cases where it could be done in New Zealand. It is a question of administration and finance. In grouping these small schools to a centre, too, you would not only gain in the matter of improved efficiency, but you would get better staffing and better teachers for them. For instance, the hand-work training that is not given in the very small schools would then be given in these central schools. We consider that the Inspectors of the Dominion should be under the Central Department with respect to the interpretation of the regulations and of the syllabus, and that a Dominion scale of salaries, which should be such as to attract the best teachers in the profession, should be adopted for Inspectors, and that the four Chief Inspectors should be responsible for the examination of all secondary schools and district high schools. You will understand that we advocate four Boards, and if that idea is adopted there will, of course, be four Chief Inspectors. The Commission may wonder why we should take up the question of a Dominion scale of salaries for Inspectors. One of the complaints that teachers have throughout the service—and it is very pronounced in the North Island—is that the Boards appoint as junior Inspectors young men of limited experience, and so on, and, of course, they naturally remain in the inspectorate. They are appointed at a low salary, whereas it is considered that the salary of an Inspector, who is practically over the teacher, should certainly be above the salary that any teacher gets. We feel that the inspectorate should be filled from the ranks of the teachers, from those who have had experience, and that the salary should be commensurate with the work an Inspector has to do. In regard to the point that the four Chief Inspectors should be responsible for the examination of secondary and district high schools, at the present time we have Inspectors from the Department inspecting these schools, and we contend that our own Inspectors under the Board could overtake this work, and that there would not be the overlapping that there is at the present time.

2. Do you include technical schools in that recommendation?—No. I think that many of the branches in technical schools are of such a nature that you would require special Inspectors for them. I refer to such subjects as plumbing, &c. There is one point I missed in regard to one Board controlling primary, secondary, and technical education. At the present time the secondary teachers in our district high schools have little or no outlook. There is a certain point they can reach as secondary teachers, carrying a salary of about £240 a year. It was considered that if the secondary schools were under the Education Board the outlook of these teachers would be widened, as they would then have positions open to them in any of these three branches of education. This would remove, too, one of the objections, shall I call it, that is sometimes urged to appointments to secondary schools—that the teachers are appointed on account of their academic training and not on account of teaching experience. We also considered the question of the examination of pupils, and it was decided that in the interests of the children the number of compulsory periodical examinations by the headmaster in each year should be reduced from three, as at present, to two. When I refer to these three periodical examinations, I wish you to understand that the results have to be tabulated; they have to be put in the register for submission to the Inspectors and for reference purposes. It was considered that two of these tabulated examinations should be sufficient during the year. That does not mean for a moment that there are only going to be two examinations in the school in the year. For instance, in pretty nearly every class the teachers hold a monthly class examination. We consider the three examinations entail unnecessary work on the pupils, because the class teachers, when they know the headmaster's examination is coming on, begin to revise their work some time before the examination; and we consider that the abolition of the third examination that is demanded now would allow the pupils to do extra work during the time that it now occupies. In addition, the class examinations that are held pretty well monthly cover all that is required in the way of examinations. With regard to proficiency certificates, we think that the examination for proficiency certificates should be uniform throughout the Dominion, and that the responsibility of examining for same should be placed on the Inspectors. I may say that this is done in Otago. The Headmasters' Association in Dunedin consulted the Secretaries of Institutes in all the other provinces, and we found that the practice differs throughout New Zealand. In some places the headmaster's examination

is taken in a number of subjects and the Inspector takes only some of them. We consider that the leaving-certificate, which is to a large extent the certificate of admission to the public service —at any rate, to the Railways—should be uniform throughout New Zealand, so that the children in all provinces would be treated alike, and on that account the responsibility of examining for these certificates should rest with the Inspector. There is one matter I would like to bring up here, and in regard to that I am going to express my personal opinion, but I can say that I know a very large number of teachers agree with me. I wish to speak about physical training. I am of opinion that at least half an hour daily should be devoted to physical training in our schools. By "physical training" I mean breathing-exercises and exercises with the limbs—head, arms, body, legs, and so on. If that is done every day I think the health of the pupils and the strength of the pupils will be very much increased. I heard it advocated this morning that continuation pupils should have one hour a week at least in the gymnasium. I consider that an hour a week given to gymnastic or physical training is just about as valuable as giving a dinner one day a week. If we are going to take up physical training it is far more beneficial to give some definite training daily. Intimately connected with the question of physical training is the question of adequate recreation-areas. I think there should be a unit of area per pupil for recreation similar to the present unit of area allowed per pupil in floor-space. We find the schools growing and the playgrounds being attached for school buildings. I will take the Musselburgh School, for instance, which has grown and grown very largely. We find new buildings are going up and the recreation-area is being covered with these new buildings, but we never hear of the recreation-area being extended. It is gradually lessening, although the number of pupils is increasing. Therefore, if we want to prevent physical deterioration, especially in our cities, we ought, I consider, to provide that there shall be a definite unit of area per pupil for recreation purposes, just as there is a definite unit of area per pupil in the school.

3. *Mr. Pirani.*] You refer to certain education districts being close corporations against the admission of outside teachers: have you any objection to mentioning any of these educational districts?—It is a very difficult matter to get into the Auckland District, and I think it is a fairly difficult matter to get into the Otago District once you get out of it. I do not think I am very far wrong when I say it is difficult to get into the majority, except the smaller districts.

4. The districts you mention are the districts which have training colleges of their own?—Yes.

5. And is it not a fact that the districts you mention where it is easy to gain admission have no training colleges?—It may be so.

6. In Westland, Nelson, Marlborough, Grey, Wanganui, and Hawke's Bay there are no training colleges: am I not correct in saying it is easier for an outsider to get into any of these districts than it is to get into districts where there are training colleges?—If they do not train their own teachers they must admit from outside, but even in these districts I should say the tendency is to promote their own teachers in preference to outsiders.

7. But the tendency would be worse, surely, if they had their own training colleges?—If you are going to establish thirteen training colleges I dare say it would be worse.

8. Do you not think that shows all the more the necessity for a Dominion scale of classification?—Undoubtedly. That is what we advocate. We think that will bring it nearer than it ever will be with thirteen Boards. Some Boards are so small that it is impossible for them to have a scheme of promotion.

9. What districts do you refer to that had the junior Inspectors that were complained about?—If I remember rightly I think the Auckland delegates were strong on that point at the Council.

10. The lowest paid Inspector gets £400 a year in Auckland?—I think not at that time. I think some of them were appointed at £350.

11. You did not say anything about nature-study in the primary schools, and I would like to get your personal opinion on that question?—I have not mentioned that because it is to be taken up by Mr. Pinder, of the Syllabus Committee. My personal opinion is that you really cannot begin nature-study too early. I think it is one of the most valuable adjuncts of education in our schools.

12. I suppose you give physical drill regularly in the primary school?—Yes, I have the whole school out in the playground for a quarter of an hour.

13. And you think that amount of time should be doubled?—I would not say doubled, because perhaps half an hour might be too much, but I think at least twenty minutes ought to be demanded by the syllabus to be devoted to physical training every day.

14. Who inspect technical schools at the present time?—I understand special Inspectors from the Central Department.

15. Do you know if they have special qualifications?—I do not know.

16. *Mr. Davidson.*] What is the average attendance at your school?—Just on five hundred. We are staffed, I might say, on a 401 basis, although the school is right up to 550 this year on the roll.

17. Is the attendance at your school being seriously affected at present from any cause?—There are over a hundred absent every day from measles.

18. Do you think the departmental regulations should allow the Inspector-General discretionary power to add to the staff of a school on the recommendation of the Board's Inspector when a rapid increase in attendance takes place?—I certainly think it should be so in the interests of the children, because when there is a rapid increase and the staff is limited the children must suffer, because it is almost impossible to cope with the work.

19. Can you give us approximately the number of pupils who supply their own books though they are already supplied free by the Department?—I should say about 95 per cent., roughly. You will understand there is no compulsion in this matter at all. The children get their own books because they prefer to have them to do their work at home.

20. Do you think it would be better if, instead of supplying free books, the Department supplied sufficient money to provide school stationery, pens, ink, &c.?—I certainly think it would be very much better.

21. *Mr. Thomson.*] You saw service under the Victorian Education Department?—Yes.

22. There were no Boards of Education or School Committees in Victoria?—Not at that time.

23. So far as you remember, will you tell us what was your experience in regard to promotion in Victoria under the Central Department?—Well, at that time there was no scheme of promotion at all. Of course, they have adopted a scheme of promotion since, which has very much altered matters. I do not know how that scheme of promotion has worked out. At the time I left there promotion depended on political patronage.

24. So there is much virtue in our system of control by Boards and Committees after all?—I certainly think that with Boards and Committees you get local control, but we should like to see a Dominion scheme of promotion adopted on the lines of Auckland—namely, we want one name sent on to the Committee, and not four as is done here, because we consider that the Inspectors attached to the Boards are the people who know how the promotion should be worked out. It should not depend on a Committee of non-experts who have no means of judging.

25. You are aware that Mr. Tate, the Victorian Director of Education, approves of the New Zealand system of Boards and Committees?—Yes.

26. You say that the sub-committee whom you are representing consider that four Boards only in the Dominion would improve matters?—Yes.

27. There are thirteen Boards at the present time, and if a reduction to four would improve matters, does it not follow that if you reduce the number to three or two, or even one, or abolish Boards altogether, you would still further improve matters?—No, because then you would lose local control.

28. You admit there is much virtue in local control?—Undoubtedly.

29. You consider it stimulates enthusiasm?—It does in certain directions.

30. And encourages people to take an active interest in promoting education in all departments in their district?—There is always more interest locally when you have the local people represented.

31. Under a system of four Boards I take it you would divide the South Island into two districts: did your Committee consider whether there might still be that continuity of interest which would lead people to take that active interest in education which you have just admitted stimulates educational activity in any given locality?—Yes, we did. We take it that Otago and Southland would constitute one Board at this end of the Island; and that South Canterbury, Canterbury, Westland, and Grey would form another; Nelson and Marlborough and the southern part of the North Island going into Wellington as a centre; and Auckland forming another. In regard to Westland and Grey, it was considered by us that when the Midland Railway goes through these districts will be within easy touch of Christchurch as a centre.

32. Do you consider these four Boards would create the same amount of local interest and promote the same local efficiency as obtains to-day?—Undoubtedly, because you would still have Committees in the different centres just as you have them now, and with the Committees as centres you would have the local interest.

33. In considering this system of two Boards for each Island have you thought out what would be the best system of election for the Boards?—No, we have not thought that out.

34. I suppose the real reason why you want a reduction in the number of Boards is to secure this Dominion scheme of promotion for teachers?—Not at all. I think one of the chief reasons is the reduction in expenses. There must be a reduction in expenditure by a combination of a number of the smaller Boards.

35. May not that reduction in expenditure be at the cost of local efficiency in administration?—Not necessarily. For instance, so far as local government is concerned, we have now a Greater Dunedin, and that amalgamation of the smaller suburban boroughs has certainly not resulted in any loss of efficiency so far as the upkeep of the city is concerned.

36. Are you aware that the opinion has been expressed that Auckland should be divided into two education districts—that the portion south of Mercer should be separated from the Auckland District and formed into a separate district?—I am not aware that statement has been made. I should value it according to the standing of the person who made it.

37. Where did the demand for a reduction of the Boards to four originate—from the Teachers' Institute, from the Committees, or from the public generally?—It has been discussed and approved by the Teachers' Institute for some years, and that represents the whole of the teachers from Auckland to the Bluff.

38. Have the School Committees ever made any pronouncement in regard to the matter?—I do not know that they have.

39. Generally you are in favour of the existing system of local control by Boards and Committees, only you are of opinion that the number of Boards should be reduced?—That is so.

40. Do you not think it would be possible to have a Dominion scheme of promotion even supposing you had eight Boards in the Dominion: has your committee thought that matter out?—I think we could have it with eight just as well as with four, provided you had the whole of the teachers graded; but it would be more difficult probably with eight than with four: there would be too many diverse interests coming in.

41. *Mr. Poland.*] Is not your object in advocating a reduction in the number of the Boards that the teachers may thereby secure a better system of exchange and promotion for themselves, and thereby increase their opportunities of obtaining better positions throughout the Dominion?—That is one of the reasons, and when we advocate that you will understand that if you improve the position of the teacher you will improve the work that will be done with the children, because

the more contented you make the service and the better opportunity they have in the service the more likely you are to get better work done. You are not to forget that we think the cost of administration would also be very much reduced.

42. You are not bound down absolutely to four districts: I presume, as Mr. Thomson has said, eight would be better than thirteen, but you think four would be better than eight?—Yes.

43. Do you not think, if there were, say, three Boards in each Island, with training colleges in each, you would thereby increase the efficiency of the teaching, because the greater the number of training colleges the greater the number of efficient teachers are likely to be turned out?—I do not think there is room for six training colleges in a small Dominion like ours. In New South Wales there is only one, and in Victoria there is only one. If you increase the number here to six you are going to increase the cost of producing teachers very materially. The time ought not to be very far distant when the four we now have should easily cover all the requirements of the Dominion.

44. Do you think we could have much larger training colleges in each centre than at present?—I do not think we need them any larger. The increase in the staffing at present has caused the training colleges not to be able to keep up with the demand, but that ought to right itself in a short time.

45. You have had training colleges in existence for thirty-five years?—Before the Dominion scale of salaries came into force we could supply all the teachers we required here. The Dominion scale of salaries made New Zealand the field for Otago teachers. Before that the Otago teachers were higher paid than the teachers in other parts, and they would not go out, but they have gone out since.

46. You think that from now on the training colleges will be able to supply the demand for trained teachers?—I think so.

47. Do you believe that the present scale of salaries will induce a sufficient number of men and women to enter the teaching profession to provide in the future for all the necessities of the profession?—I would not like to express an opinion in that respect. In comparing our scale of salaries with that of other Departments, like the Customs or Post and Telegraphs, we have nothing like the plums that they have. I do not think the profession is likely to be as attractive as these other Departments, but so far as present appearances point we should be able to overtake the supply of teachers in the future.

48. Is it not a fact that a great proportion of teachers are women, and that a great proportion of these women, within a period of years, leave the profession in order to get married?—You get the same position in nearly every part of the world.

49. I understood you to say, with regard to children who had obtained junior scholarships and free places, that the teachers with the Inspector should then decide as to whether a pupil should go to a high school or technical school for further instruction: do you not think the parents should have some say as to where the child should go?—Undoubtedly the parent would have to have some say, but I took it that the teacher would be familiar with what the parent would like the child to do.

50. Would you not rather say that the teacher and Inspector should advise the parent as to whether the child should continue at the high school or at the technical school?—I do not know that I would. These are practically scholarships, and there is a large number of children going to the high schools now who are really not capable of appreciating the tuition they get in the high school. They would get better results probably from technical training.

51. Why do they not get the results from the high school?—Because they are following a course that does not suit their special bent. For instance, Mr. Marshall has told me that some of the best work in the technical school is produced by those who failed altogether in their proficiency certificates.

52. Might not the contrary position also obtain—that children after obtaining a proficiency certificate might go to the technical school who would be better fitted for a high-school education?—That is where I think the headmaster would advise.

53. Do you not think that some portion of that half-hour for physical training might be given outside the present school hours?—I do not think so. I think physical training is not only a training of body, but it is also a training in discipline. I hear, for instance, military drill spoken of as if it were of no force or benefit at all. I think very often the question of discipline is lost sight of altogether. I think military drill is an excellent training in discipline.

54. *Mr. Kirk.*] What in your opinion is the value of the Junior Cadet movement solely from the physical-culture point of view?—I think it is valuable for the physical training they get and from a disciplinary point of view.

55. Would you advocate, in addition to the physical culture that is provided for boys by the Junior Cadet movement, an additional half-hour?—Yes, for this reason: I think the stronger you can make the future citizen the better the return the Dominion will get from him in his after-work. I am positive that physical training given every day will make our boys capable of better work in the future; and even as regards school-work itself, I say it pays me to take a quarter of an hour every day to give these children physical training in the open air.

56. Have you any reason to believe that immorality exists in the schools?—No.

57. What have you to say as to the general moral tone of the schools?—I should say the general moral tone is good. Of course, a great deal depends upon supervision. If there is good supervision in the school-ground I do not see how anything immoral can come into the school.

58. You think Junior National Education Board Scholarships should be abolished and the moneys devoted to children living away from home?—That is so.

59. Are we to take it from that that scholarships should not be regarded as an incentive to better work, but merely as a means of providing an avenue for the poorer boys living in the country to obtain further education?—Well, I take it there would be an examination for those

boys, and you get the best from the country districts. At the present time the town boys can get what are practically scholarships in the shape of free places, as formerly they had to pay ten guineas at the high school. It seems to me the difficulties they have to contend with in the back-blocks and the outlying districts can be met if we forego these scholarships in the towns. That is the opinion not only of the Otago Institute, but of the New Zealand Institute also.

60. Do you believe in differentiating between the poorer classes and the wealthy classes in the country districts?—No; I think it makes for class distinction.

61. If you take away a scholarship, for instance, from the son of a poor widow living in the town and give an allowance for board to the son of a squatter living in the country?—I think in that case the squatter ought to be manly enough not to take it.

62. But you would give him that opportunity?—That is a question I have not considered. A few might benefit who should not benefit, but the percentage would not be large enough to make it necessary to differentiate.

63. *Mr. Wells.*] With regard to the scholarship question, would you make an allowance for books?—We have not considered that, but perhaps it would be a good idea.

64. You spoke of the scholar being required to buy his own books?—Not required.

65. You recommend that he should buy his own books. You know there is a regulation at present for money which may be spent on stationery provided the School Committee contributes a certain portion. Has any advantage been taken of that here?—Yes, in the Fifth and Sixth Standards only.

66. Would you like to see that extended right throughout the school?—Yes, or else the children should be allowed to take books home. I think the reader, which forms the basis of the pupil's training in English, should be his own property.

67. Is it your experience that the issue of the supplementary reading-books has led to an increased love of reading?—I think the *School Journal* has had a distinctly beneficial effect in that respect. The children look forward to it, and they seem to enjoy the reading of it.

68. You spoke of a grading Board and grading for a Dominion promotion scheme; you suggested two teachers from each district for that Board: why two teachers?—They would be familiar with the requirements of the district.

69. They would have to be experienced teachers to be able to gauge the merits of teachers?—Personally, I think Inspectors would be better, but "teachers" was put in by the Committee. I should say the experts who come in contact with the teachers would be the ones best able to assign the marks on which they would be graded.

70. You objected to local rating. Suppose the cost of salaries were charged to the Consolidated Fund, and the local rating subsidized by the Government was allowed for school appliances, and that sort of thing, would that be a good thing?—No; I think some schools would be much better equipped than others. In some suburbs wealthy people reside, and in other the poorer classes reside. In the wealthier suburbs more would be contributed towards the school, and those schools would be better equipped than the others. I think in a national scheme of education all should be treated alike in that respect. It should all come out of the Consolidated Fund.

71. Have you in your experience come across any extreme instances of child-labour?—Yes, very much so. I have instances in my own school. We have boys getting up at half past 4 and 5 o'clock in the morning and working until half past 8, milking, and taking papers round after school. They work five hours in school and from five to six hours out of school. Over and over again in school when I have seen them listless I have asked them how they felt, and they generally reply that they feel sleepy. It is almost impossible to do anything with those children. I have noticed some of those boys doing really brilliant work up to the Third Standard, but when they reach the Fourth they begin to drop off; in fact, they cannot cope with the work at all. The way in which those children are treated at home is really scandalous, and very often in cases where the parents can afford to do without the labour of the child. In one instance which I reported lately the boy was simply taken away from the school. Of course, I ought not to have done it, as I lost from regular attendance.

72. One more question with regard to the appointment of teachers: it is the custom here to send in several names to the Committee?—Four names.

73. Is it within your knowledge that a teacher other than the one at the top of the list is chosen sometimes?—It is very rarely that the one at the top of the list is chosen.

74. And the effect on the teaching profession?—It naturally causes a great deal of discontent.

75. And must react on education?—It causes discontent.

76. *The Chairman.*] Assuming the cost of education—that is, the providing of the necessary teachers, the buildings, and even the playgrounds—in the first instance were made a charge on the Consolidated Fund, and the charge on the local body, whatever it is, went for repairs and the future upkeep and playgrounds, would that not lead to economy of administration?—No, I do not think so.

77. Is it not a fact that now indirectly they have to do it—that it is a grievance with nearly every School Committee that the number of appeals to the parents for one thing and another is becoming irksome, and that our so-called free education is not free education at all as regards ordinary details: I refer to prize-money, pen-and-ink money, and so on?—That is so, but at the same time we think if you allow that to come in you will differentiate very largely between the two parts of the same community, and some people will be able to fit out their schools and get a larger percentage of the Consolidated Fund where there are subsidies than they would in other districts. That would not be a national system of education.

78. If you are told that the experience of other nations is entirely different—that economy is fostered and local interest in the school engendered to a greater degree than we have now by such a system, would you dispute it?—I have had no experience of it,

79. Would you recognize Mr. Frank Tate as an authority?—Certainly, on some things.

80. If he makes such a statement as this—"The advantages of such a measure of decentralization (local control of school buildings and appurtenances) in purely business matters are sufficiently obvious, and the result in stimulating local interest in the local school and in minimizing the exasperating delays of our present cumbrous procedure would be very great indeed"—what would you say to it? That is the experience of a man who has travelled the world over and has seen these local powers in operation. Would you be disposed to say in the face of this that such results are not obtainable?—Certainly not. He has had facilities for forming his opinion such as I have never had.

81. I understand you to say the teachers in the secondary schools should be equally trained teachers as in the primary schools, and that the sole test should not be educational attainments? —They should have educational attainments plus training in every case.

SATURDAY, 15TH JUNE, 1912.

EDWARD PINDER examined on oath. (No. 36.)

1. *The Chairman.*] What are your qualifications, and what position do you now hold?—I am a Master of Arts of the New Zealand University, and have been engaged in teaching for thirty-one years. I am now head teacher of the Normal School in Dunedin. I attend here as representative of one of the branch committees of the Otago Educational Institute—the committee on the syllabus and the administration of the syllabus chiefly. I should like to give my experience first as a public-school teacher. I was a pupil-teacher for four years to start with, then a student at the Training College for one year; after that I went practically through all the grades of schools—a sole-teacher school, a two-teacher school, a four-teacher school, and the District High School; I was in the Mosgiel District High School for eight years, and now I am in the Normal School: so that I have been through practically all the grades of the profession. As you are aware, the Otago Educational Institute appointed three committees to bring evidence before this Commission. You heard representatives of two of those yesterday, and I am representing the third. We took the greater part of two days going through the syllabus, and we found, as the Institute has found before, what a very good syllabus it is. That was practically the conclusion we came to. Its only fault, if it has any, is, as is generally urged throughout the country, that there is rather much matter in it. Yet it is astonishing how little change we teachers can suggest. The following are the suggestions my committee made: In section 5 of the Syllabus Regulations, 1908, the committee recommends that the number of periodical examinations by the head teacher should be two instead of three: that is the minimum number. At present the head teacher's examination each term practically occupies him a month, and in the opinion of the head teachers three of those examinations in a year is rather too much. I am giving the opinion of the committee, not my own personal opinion. It must be remembered that this head teacher's examination is quite a different thing from the Inspector's examination. The Inspector's object is simply to see what progress each class is making as a whole. He can simply take a class in one subject and go from one to the other, and cannot get over the ground in two or three days. Our work is entirely different. We have to examine every child in the school in arithmetic and all the other subjects—written work and oral work—and the results are as I have told you. Then, as regards Regulation 12, my committee recommend that the inspection report should be divided into two sections, one dealing directly with the teacher's work, and the other with the things, such as cleanliness of premises, and so on, for which the Committee is responsible. At present all this is contained in the one report on the school. Then, in Regulation 13, which deals with the Inspector's report on the teachers' work, we are of the opinion that a clause requires to be inserted to this effect: that where a teacher has changed or has been absent from class for some time before the examination, say, within a month or two, such absence should be noted on his report which contains the results of that examination. At present that is not done, and we received several complaints from members present that they had had reports made on their former work which they had been away from for a month or so, and there was no mention made in the report that they had been absent. Then, coming more directly to the syllabus, in clause 19, which deals with proficiency certificates, the committee recommend that in the subjects for the proficiency examination geography be removed from the (*b*) list, which practically makes it a subject for a long examination and is one of the subjects for the 60-per-cent. aggregate, and put on the (*c*) list and thus made one of the subjects in which the pupil must satisfy the Inspector that he has been sufficiently instructed in. Our reason was, shortly, this: that a subject like geography is a very wide one, and if it is to be put down as a subject for a written examination, it means a great deal more carrying of matter in the memory than would be the case if made a subject for oral examination. It will be realized that an Inspector in conducting an oral examination on the exports from the different ports or the work of a country would adopt a line of questioning which would prepare the mind of the child and revive mental associations, whereas if the pupil has to answer the question in writing he has to carry the chief towns and ports of the whole civilized world in his mind, and he has three minutes in which to answer the question. By an oral examination the Inspector can soon find out whether the pupil has really been taught the subject, while by a written examination he cannot ascertain that so readily. With regard to No. 37, which deals with the readers that are recommended, the question sometimes arises as between a miscellaneous reader and a continuous reader. Well, the committee are of the opinion that the miscellaneous reader is preferable. Our reason is that if you adopt the continuous reader you are limited to one man's style and one man's matter, whereas if you adopt the miscellaneous reader for the purpose of study you have greater variety, and more chance of doing better work

on the lines which call for a change of work. Then, in the matter of poetry, it was the opinion of the committee that the poetry in the special reading-books was not a very high standard, and it was also the committee's opinion that the poetry got exceedingly stale because the reading-books are kept on year after year. Of course, it can be said that that can be obviated by teachers giving selections of their own for the purposes of poetry-repetition. But the committee thought there was a good way out in the existence of the *School Journal*, and they recommend that the February issue of the *School Journal* each year should be devoted mainly to being a poetry issue. It should contain selections of good poems which could be prepared by the pupils during the year. At all events, it would afford teachers a constantly changing field, and there would be a freshness about the poetry which there is not at present. They look upon poetry as a very important part indeed of the English work of the school. We come now to the consideration of the special subjects of the syllabus. The committee had practically no changes to recommend in the English part of the syllabus. It was felt that in the big schools more grammar might be done, but, on the other hand, in the less efficiently staffed schools that perhaps would have been a hardship, and, of course, the syllabus is practically a compromise between the two. The committee therefore decided to leave the English as it is, so far as their recommendations are concerned. In arithmetic, of course, the committee are aware of the prevailing charge that the arithmetic is not so accurate as it was at one time, and their opinion is that that charge is in a large measure correct. That is my own personal opinion, too. Accordingly they make the following recommendations: (1) For examination purposes no written problems be required in Standards I and II, and in Standards III and IV only one written problem be required, which shall not involve more than one operation; (2) that for examination purposes 60 per cent. of the mark value of sums set in Standards V and VI be for mechanical work. The general opinion of teachers I have come in contact with was that the slight mechanical work in the lower standards was not enough abstract concentration work. The pendulum since the present syllabus had swung too far forward, and it was thought that a middle course was best to counteract it. The mistakes made in arithmetic are not mistakes of ignorance—it is not that they do not know their tables—it is the want of concentration; and the committee were of opinion that the concrete work, good as it is and necessary as it is, had been rather much magnified, and not enough attention had been given to the abstract concentration work, because, after all, when you make a calculation it is purely an abstract matter. You add up a column of figures, but the last thing you are thinking of is the actual figures themselves. At the same time, the children must have the concrete things at the back of the mind. They were not there at present, and the committee reckoned that that was the cause of the present inaccuracy in arithmetic. Another recommendation of the committee was that necessary apparatus for weighing and measuring be supplied to the schools. That is largely for Standard IV. At present there is no such provision. One teacher will make his own arrangements, and when he goes away from the school to another he takes his apparatus with him. Some of the bigger schools have been able to get their Committees to spend money on the matter and have a permanent equipment of a sort, but it is thought that all schools should be on an equal footing. The committee also thought that the work of Standard IV was rather heavy compared with Standard III, and they recommend that simple reductions in avoirdupois weight and measuring in feet, yards, chains, and miles might be taken in Standard III instead of Standard IV. Then, another recommendation is that practice in Standard V should always be worked by decimals, and that in the same standard interest-sums principals should not involve pence and farthings. It is also recommended that proportional-part sums be cut out of Standard V. It was considered that these very seldom arose in after-life, and they were subjects which could be varied to a certain extent and required a good deal of work. In regard to metric work, the committee thought that that should be transferred from Standard VI to Standard VII, until the system was used in every-day life. The metric system is, of course, used now in scientific work to the exclusion of all others, but the ordinary every-day life of carpenters and tradesmen it is not used to any extent that I am aware of. The committee also recommend that the arithmetic-books used in Otago be completely revised, in addition to what I have mentioned, on the following lines: (*a*) more large-sums work in the lower standards, and fewer problems; (*b*) problems in Standards V and VI, and Standard IV be cut out—this, of course, has reference only to what obtains at present in Otago—and that their place be taken by a type of problem more suited to the ordinary commercial, business, and manufacturing life of the Dominion. The committee thought that a committee should be appointed consisting of teachers and business men, and that they could evolve a type of problem that would be more suited to the practical requirements of daily life and at the same time give such mental training which would be of more concrete value than that at present is the case. I can instance that by the measurement of timber. There is no pupil who leaves school who knows what is meant by the term "100 feet of timber"—no teacher either, for that matter. I do not know myself. I have been told several times by practical men, but I always keep forgetting. I am only bringing that forward as an instance of the unpractical nature of the problems set in the upper standards. I dare say if these problems were wiped out it would be found that pupils would go on to the high school possibly not so well equipped for matriculation as has been the case, but I do not think that our standard should be set for matriculation, but for the necessities of daily life. A very small fraction of our pupils ever go near the University or have anything to do with matriculation. Another recommendation of the committee is that the sums in the upper standards be arranged to be worked by decimals rather than by vulgar fractions, which are made to cancel out always and so are out of touch with actual conditions. There is little mechanical work in working out these sums on the present system, and if persisted in the pupil gradually weakens in the calculating-fibre, if there is such a thing. They get into the habit of expecting the sum to come out easily, and if it does not they lose heart to tackle it. I dare say when this practice was drawn up it was

felt that the pupils would be able to cope with the problem work without being bothered with mechanical work while thinking of the principle, but the committee were of opinion that it had been carried too far. In geography the experience of teachers forming the committee was that the A course in geography was too heavy, and accordingly they recommend that the A course, especially in Standards V and VI, be lessened by cutting out whatever does not directly bear on commerce and history, and that the B course be consolidated by means of a text-book. They recommend that history remain as at present. At present history is a compulsory subject in the syllabus. There is no reason why a teacher should not treat it thoroughly. It is pressure of other subjects that keeps the teacher from taking up history fully. I have heard history referred to as if it was not compulsory. It is a compulsory subject on the syllabus, but the syllabus says it may be treated as a reading subject, with the provision that the teacher questions the pupils and sees that they have a full understanding of what they read. In the Junior Scholarship Examination last year there was a question in history asking what events led up to the Magna Charta, Habeas Corpus, and Bill of Rights respectively. History used to be treated as a written subject. What did a question like that mean? A teacher did not know what questions were to be asked. The pupil had three minutes to devote to each answer, and it meant that he must have in his mind all the matter connected with the bulwarks of English liberty, the events that had led up to them, and the necessity for them. It is felt that that is not needed in the case of children. The committee's opinion was that history should be made more of a personal matter. The child takes no interest in constitutional things. He takes an interest in people, and the committee considered that history should be made more a matter of biography. Great men should be picked out and an interesting story of each given, and if that is done the child will take an interest in it and read with profit. The great defect is that text-books are uninteresting to children, and the present state of history in the primary schools is largely due to the unsuitable nature of the text-books. In regard to scholarships the committee recommend that the time has arrived when all Junior National and Education Board Junior Scholarships should be abolished, and the money so saved be spent in paying lodging-expenses of those children who require to live away from home in order to attend a district high school or secondary school, and who, in the opinion of the Inspectors, have shown by the results of their proficiency examinaton that they are best qualified to benefit by receiving secondary education. The best of these pupils should be selected by the Inspector on the proficiency examination. Of course, you might have an examination to select the best, but the committee did not want to put the burden of the scholarship examination on country schools which they were not willing should be placed on themselves. The main reason for making this recommendation was that, in our opinion, the present system of scholarship examination leads to cramming and overwork, and a wrong estimate is set on the value of what is taught in the school. You have only to read the papers set for the Junior Scholarship Examination and those set for Standard VI Proficiency to see the meaning of that. The arithmetic in the 1910 Junior Scholarship Examination was three or four times harder than that set for the Proficiency Examination. Geography was the same. These Junior Scholarship Examinations made far too strong a demand on the child. I can talk from experience with regard to this 1910 examination, because my own girl sat for it, and I know the work it was. I know from my own experience as a teacher of the last ten or fifteen years that every child who got a scholarship had worked one or two hours extra every day, and I had not the very dullest children under me. I cannot imagine that the scholarships are gained on the school-work only. I do not believe it for one moment. It has never been my experience. You may get a particular case of extra-smart child where such is not the case, but I am talking of the average child. I say that scholarships are gained as the result of a great deal of mental overwork. I am of opinion especially that girls of the age of fourteen should not be allowed to go for scholarships. The working for a scholarship is bound to do them harm. The committee did not go into the question of nature-study and the other work: we had not the time. We sat for two days, and that was all the time we could give to the work. Had we gone into them I do not think we would have recommended much change. It was wonderful when we went into the syllabus how little there was to alter. That merely shows how good a one it is in the main.

2. *Mr. Pirani.*] Do you say that girls should not be allowed to go up for scholarship examinations?—Yes.

3. Do you not think that if girls are not allowed to compete in scholarship examinations there should be some other system of awarding scholarships to girls?—Our recommendation is that scholarships should be done away with altogether.

4. Even in the country districts?—No. With regard to those far away from the secondary schools there is no reason why the Inspector and the teacher should not pick out the children who are more particularly fit to go on to secondary education. The teacher has the record of the child's work, and the Inspector who knows the working of the different schools could say which child was fit for secondary education.

5. Instead of the ordinary competitive examination these scholarships should be awarded on the opinion of the teacher and the Inspector?—That is so.

6. *Mr. Davidson.*] As headmaster of the Normal School you come into contact very much with the students of the Training College?—Yes, to a considerable extent.

7. What is your opinion as to the attitude of the student to his University work as compared with his ordinary work in teaching?—My opinion is that a student who will take a keen interest in one will take a keen interest in the other. I am talking of the average student. I have seen occasional instances where a student has preferred the University work, but that is an exceptional instance.

8. Do you think that on the whole the students are as intensely interested in the practical work of teaching as in their desire to pass their University examinations?—That is really a big

order. The bulk of these students have been pupil-teachers, and they have not attended the University. That brings in factors I could not speak about. As a rule those who are keenest to get on in the University are the most conscientious in their assistance to the class teacher.

9. You have had experience of practically all classes of schools in the education service?—Yes.

10. Do you think that if some assistance was given to the teachers of schools between thirty and forty it would tend to increase the supply of desirable students for our training colleges?—You mean it would make more vacancies for pupil-teacherships?

11. It would provide more openings for country children for entering the teaching service?—I believe it would be a good move, for this reason: we get both classes of students at the Training College, and there is no comparison between those who have been pupil-teachers and those who have not. If you are going to depend on those who have not been pupil-teachers for the supply of teachers it is a wrong principle to go on. To expect to turn out a teacher on two years' training is absurd.

12. If these country children had two or three years' training under the teacher of a sole-teacher school and then had two years in the Training College in the city, do you think they would return to the country to take charge of these smaller schools in the backblocks? Do you believe that such teachers would be more likely to remain there contentedly than those teachers who have lived in the cities all their lives?—I think there would be a slight probability, but not a very great one. After all, it is a question of the distance away from the conveniences of the city, and a small salary; and I think that will always rule the supply.

13. Do you not think there would be a tendency in that direction?—Yes, but very little.

14. With regard to history, is it not really in the hands of the Inspectors to see whether or not this subject is really treated in a thorough manner?—So far as the syllabus goes, that is so. Of course, you may also say it is on the conscience of the teacher to treat it properly.

15. If the Inspectors insist on its being taught properly the chances are that the teachers will yield to that pressure?—Given suitable text-books.

16. *Mr. Poland.*] Do you think that the children attending the Normal School suffer in any way in the matter of their instruction by the students teaching them?—I think the Inspectors could answer that better than I.

17. You are not in a position to answer it?—I can only answer from the Inspectors' reports. The Normal School has been accredited with "excellent" not only as regards teaching, but also as regards tone and discipline, and there was only one other school in the district which got that mark. What that means exactly you can ask the Inspector. I think it is rather a benefit to have the students working in the school.

18. You cannot answer the question?—You must have really good teachers in a normal school, but given good teachers there is no reason why a student should not do a great deal of class work under the teachers' direction, and do it well, and the class not suffer.

19. Is it not possible for the Board to get the best class of teachers for the Normal School?—Our Board do that, I am glad to say. They have sent me several teachers since I have been in charge of the school, and I am of opinion that they made the best selection.

20. When you were in charge of a district high school was there a rural course?—No.

21. Do you understand what is in the rural course provided by the Department?—Yes.

22. Do you know any district high school around here where it is in operation?—The Board have appointed three teachers. I have no personal knowledge of the teaching of the subject.

23. *Mr. Kirk.*] You think that an immense amount of cramming goes on in connection with preparation for scholarship examinations?—Define what you mean by "cramming." If you accept my definition of cramming as not necessarily implying work under study, but carrying too heavy a load of work in the memory to be used at a certain time, and everything carried ready to be put down and very little original thought needed, I am of opinion that that is what it ends in as at present conducted.

24. Would those remarks also apply to the Matriculation Examination?—Not so much. You must remember that the scholarship is a competitive examination, and it is the highest number of marks that counts. The tendency of all competitive examinations is towards cramming.

25. Does it not also apply to the B.A. degree examinations?—There is no objection there.

26. Nor to the M.A.?—There is no objection there. You just try to obtain a certain number of marks. There is competition, of course, in the University scholarship examinations.

27. Would you say that for those degree examinations no cramming goes on?—My opinion is that the University course is largely cramming from end to end. I have been through it all.

28. Has any system been yet contemplated by which cramming can be avoided?—In what direction?

29. In any examination?—In all written examinations there is a tendency to cram—a tendency exacted by competition.

30. Does it not amount to this: that the constitution of man and woman is such that a really keen one will always do more than is necessary; that you cannot make up a syllabus which would prevent persons from cramming unless you made a very low standard?—You might prevent the cramming that goes on for scholarship examinations by doing away with the scholarships.

31. Do you not know cases of boys who did only an ordinary amount of work and who surprised you by getting a scholarship?—Yes, because I did a lot of work with them.

32. Does that not point to the fact that a lot of the work you call "cramming" is unnecessary?—I always find it necessary: that is all I can say.

33. Is it not rather a case of the nature of the boy who is keen, and devotes time to study which would be better devoted to physical exercise?—No. As a rule the boy who gets a scholarship is one who has ambition or who wants to please his parents, and not because of any liking for study. I have never yet met the boy who was particularly fond of study.

34. Assuming that a greater amount of time was devoted to physical development, do you think there would still be danger of physical incapacity resulting from scholarship examinations?—I do not say that physical incapacity results now, but that the tendency is in that direction.

35. What is the effect of cramming on the health?—It is detrimental. I had a boy in my class who took a scholarship at Mosgiel, and I noticed the effect on him. I noticed the effect on my daughter the year before last. The general health was lowered; the physical energy of the body was lowered; the face became pale and the appetite lessened, and so on.

36. In the case of your daughter was attention given to her physical training during the time she was studying?—She had the usual physical training given her at school: a few minutes every morning and half an hour's drill during the week, and then she walked up and down to school twice each way each day—a quarter of a mile, half of it up a steep hill. She had no spare time afterwards. As a matter of fact, she had to do a certain amount of house-work.

37. *Mr. Wells.*] You spoke of overtime work in connection with scholarships: is that a regular practice in Dunedin schools?—I can only say that to the best of my knowledge it is. It is hearsay, except in the case of my own school. I have a boy now who wants to go in for a scholarship. If we decide to put him up we will start next month. I will give him about two hours a week if I can spare it, and his class teacher will give him three hours.

38. Is that outside school hours?—Not altogether.

39. Would it surprise you to know that there is an understanding among all the city schools in Auckland that there shall not be any keeping-in for one minute after hours for scholarship and free-place work, and yet we get a fair percentage of scholarships? I can give one instance where thirty-seven out of forty got free places?—That is a different thing. There is no competition there. I am not suggesting we do overwork to get free places.

40. There is extra work done for scholarships?—Yes. There is in my school, and I believe there is in other schools. I cannot imagine it is not done where pupils are competing against each other.

41. Did I understand you to say you would confine your history-teaching to the reading of a book?—I was talking of the requirements of the syllabus.

42. Do you not recommend something more than that?—As a matter of fact I do at the Normal School, but I was giving the opinion of the committee on the syllabus required.

43. You would not confine history to the reading of a book?—If I had a suitable book, largely biographical, I would gladly do so. I have not seen a good history-book for children.

44. Would you suggest striking anything out of Standard VI in regard to arithmetic?—The quarrel with regard to the Standard VI syllabus is in the problem work given. These requirements are not in the syllabus, but in the books.

45. You would not recommend striking out compound interest?—No. That is very interesting work if done by decimals.

46. As far as you know, are teachers in this district in favour of a concrete scheme for promotion?—I cannot speak on that. We have not discussed that matter. I think the feeling of the profession generally is that something should be done, but I do not know about putting every one in hard-and-fast grades and to make promotion entirely by seniority. I do not think that that would be acceptable to most of the teachers.

47. You have taught in a district high school?—Yes.

48. Have you any opinion to offer in regard to the salaries paid to the assistants in the district high schools?—I think they are quite insufficient, and, seeing the work those assistants have to do, there is no reason why the assistants in the district high schools should not be paid as much as the assistants in the secondary schools.

49. Can you express an opinion on the effect of manual work on boys and girls?—I think the effect is a good one. I particularly specify the cookery classes. I have watched the effect on my own children and others, and have nothing but "good" to say as to the effect of cookery-work on girls. They like it and take an interest in it, and it is in touch with their future life-work.

50. *Mr. Hogben.*] Did I understand you to say that you would cut out the metric system from the arithmetic of Standard VI?—That was the finding of the committee.

51. And leave it in Standard V?—No; I suppose that has been overlooked The finding of the committee, I suppose, implies cutting it out of Standard V as well. It adds to the burden of Standard VI work considerably. The reason of the committee was that in the metric work there was a tremendous amount of work involved in the change from the present system to the metric system, and they could see no direct benefit to be derived from the large variety of problems that would be given in that direction.

52. It is really in the character of the sums set that you find the difficulty of the change from one system to the other?—In the possible scope of the questions that might be set.

53. Did the committee not consider the recommendation of the International Committee on Weights and Measures that in every country the children should be prepared for the metric system by the introduction of the system to the children?—Yes; but that is not put into the syllabus, I presume.

54. You do not agree with that?—It is a question of when it is to be introduced. As far as we could see, the time is as far off as ever.

55. You know it is legal now?—Yes, but not the slightest move has been made to enforce it.

56. Would you make any allowance to free-place holders who live in town?—No.

57. Not even to senior free-place scholars?—We did not discuss senior scholars.

58. *Mr. Pirani.*] Would you favour a Dominion scheme of teachers if promotion was to be by merit?—Merit would not have the same objection, doubtless, as seniority.

59. In regard to the appointment of teachers to vacancies, do you not think that the Inspector's placing should be final unless some good reason is shown?—Yes, I do.

60. *The Chairman.*] May I assume that the result of placing the classification of pupils in the hands of the teachers has been on the whole satisfactory?—I should say so in the case of the larger schools; but I do not see how it could be satisfactory in the case of the backblock schools, where there are a large number of uncertificated and unqualified teachers.

61. I want you to except those?—Then I should say it would be satisfactory.

62. Having proved itself satisfactory in that case, does any reason suggest itself to your mind why the extension of that principle should not be proceeded with in the direction of allowing the teacher with the Inspector to select pupils in the primary schools qualified to go on to the secondary school, instead of deciding that matter by scholarship examination?—Yes, but the scholarship is not the only means of entrance to the secondary school.

63. Would not that allow the teacher on the advice of the Inspector to promote a child to the secondary school?—The child will have the right to go to the secondary school by receiving a free place. The scholarship does not give that right—only a monetary allowance.

64. Are you of opinion that the teachers of secondary schools should have some acquaintance with primary-school work before appointment?—I should say it was a mistake that secondary-school teachers should not have some degree of previous training.

65. In your opinion would it be an advantage if appointments to such positions were made by the educational authorities of the district instead of by Boards of Governors?—Yes, I would be in favour of Education Boards taking over high schools, and working them and the technical schools together.

66. You see no difficulty whatever?—No. The same children attend them both.

67. Is there any disposition on the part of students in the Training College to study their future so far as the University is concerned rather than their work as a primary-school teacher?—You will find an odd instance of it; but, speaking generally, it is not so.

FLORA MACLEAN ALLEN examined on oath. (No. 37.)

1. *The Chairman.*] What is your position?—I am Lady Principal of the Otago Girls' High School. I have been a member of the teaching staff of that institution for twenty-one years, and have been Principal from the beginning of the second term of this year. I am a Master of Arts of the New Zealand University.

2. Have you any statement to make to the Commission in connection with the administration of your own school, or the working of the secondary schools of the Dominion as far as you know them?—Many senior girls labour under great disadvantages, for after spending sometimes five years in school and passing both Matriculation and Junior Civil Service Examinations, they can neither gain admittance to the Training College nor receive appointments as pupil-teachers or probationers. This year, in regard to the latter point, has been an excellent one, ten pupils of the school being chosen, but only two or three, I think, of last year's girls were able to enter the Training College. In former years, many, owing to this difficulty, have been obliged to abandon the idea of entering the teaching profession, and have found employment in shops and offices, or have become private governesses. Others have taken charge of country schools as uncertificated teachers. This year three senior girls who have all passed Matriculation have not succeeded in getting either pupil-teacherships or as probationers. One of these in addition has held a Senior Board Scholarship, and passed sixth for the Dominion in the Junior Civil Service, yet has yot received a position in the Civil Service either. If a system could be instituted by which girls thus qualified would be permitted to take technical subjects in the technical school, gain practice in teaching in the primary schools, and continue certain subjects in the high school, making up the requisite number of units in the three, co-ordination between the primary, secondary, and technical schools would be secured. At present, in cases such as these, the Government is paying a high price for education without receiving any return for the money expended. At present there is considerable overlapping in the Technical School and High School. We are teaching commercial subjects and the Technical School has day classes for English and arithmetic. It would be more satisfactory if the High School taught only secondary-school subjects, and the Technical purely technical ones, and pupils who wish to specialize to a certain extent in technical subjects were allowed to combine their units in the two schools. We sometimes lose pupils who wish to devote more time to commercial subjects than we are able to give to them in our time-table owing to the unit system. Further, girls who are not very strong have sometimes to be taken away from school because they find our syllabus too heavy, but if on the payment of a small fee, not higher than that charged at the Technical School for each class, they were able to take two or three classes in our school, and a discretionary latitude were allowed with respect to the units, we should retain our pupils, and they would derive the benefits of secondary education. About primary-school subjects I can say very little, and that little with considerable diffidence, for up till the present year I have had nothing whatsoever to do with the junior pupils of the school, my work being solely confined to the senior classes and to subjects not taught in the primary schools. There seems to be a concensus of opinion that the standard in arithmetic is not so high, the pupils being less accurate, but I am persuaded that the blame does not lie with the teaching of that subject, for the teaching in the primary schools has probably never been more efficient than now, but that the fault is to be attributed to the overweighting of the syllabus, which leaves less time than formerly for practice in a subject such as arithmetic. Grammar is not taught on the same lines as formerly, and many pupils in beginning a foreign language find this branch of the work very difficult. It does not seem that free education is being taken advantage of to the extent that it should. At the close of last year 23 per cent. of the first-year pupils left the school, and just 30 per cent., including those who left during the first term of this year, and 37½ per cent. of the second year, all of whom but six had qualified for senior places. At the close of their second

year girls have been in the habit of leaving and going to the Technical School if they wished to specialize in commercial subjects.

3. *Mr. Poland.*] With regard to the girl who passed the Junior Civil Service Examination sixth on the list, do I understand you to say she was not offered a position in the Civil Service?—I think not. I inquired of her earlier in the year, and, so far as I know, no position has yet been offered to her.

4. What remedy would you suggest to get over the trouble that so many girls who pass the Junior Civil Service and Matriculation Examinations are unable to obtain admission to the training colleges and are therefore lost to the teaching profession?—The only remedy would be to increase the accommodation at the training colleges, or perhaps follow out the system that I suggested of permitting them to remain as pupils of the schools, and practise teaching in the primary schools of the towns.

5. As pupil-teachers?—As probationers; perhaps not receiving any appointment, but having permission from the headmasters to assist in the various classes.

6. Are you aware whether candidates for the Board's service who have matriculated receive preference for appointments?—I do not think that has been the case always, because I think of one instance of a girl who matriculated who did not receive an appointment. She was compelled to wait for a year before she received an appointment.

7. *Mr. Thomson.*] You say that large numbers of girls leave the Girls' High School to go to the Technical School—I presume, to receive instruction in shorthand and typewriting?—I think chiefly for that purpose, but sometimes to take the domestic course.

8. Is instruction given in shorthand and typewriting at the High School?—Yes, but for a shorter time than in the Technical School. On the other hand, we have had a girl coming to us from the Technical School because she was not able to get there the subjects she wished to enable her to take up a domestic-science course at the University.

9. *Mr. Davidson.*] Concerning the alleged overlapping and lack of co-ordination between the primary and secondary schools, do you think if one body had control of primary, secondary, and technical education in this district that overlapping could be avoided?—I really cannot say. I have not considered the subject.

10. Do you not think there would be a tendency to dovetail the different branches of the system into one another if one controlling body managed affairs?—Yes, I think there might be.

11. Concerning these girls who could not obtain positions as probationers or pupil-teachers, you say that ten from your school received positions this year?—Yes.

12. And as to those who were refused, do you not think it may have been because they did not show any natural ability for teaching?—I do not know. I think that some of those who were rejected have much more ability really than some who were accepted, but perhaps on the day of examination they may not have done themselves justice. One, at any rate, was a nervous, high-strung girl.

13. I take it you do know that the Inspectors selected the candidates who in their opinion were the most suitable?—One candidate who did not receive a pupil-teachership last year was unable to sing, and perhaps that stood her in bad stead.

14. How would you avoid the evil you mentioned of the girls who leave your school at the end of the first year and the first term of the second year?—I think it would be hardly possible to avoid it wholly, because the circumstances of the families to which the girls belong have a great deal to do with the fact that they leave so early. In many cases it seems almost imperative that they should earn money as early as possible.

15. In that case do you not think it would be better that they should not enter the High School if they are only to remain a year or a little more than a year?—I really cannot answer that question.

16. Do you think that parents or guardians should be compelled to give some guarantee that pupils accepting free places shall remain at the schools for a definite period?—I think that would be a great help if it could be carried out successfully.

17. *Mr. Pirani.*] Did you find that that sort of thing occurred with the pupils who came to the school in the past before the free-place system came into operation?—No, I think not. It used to be the habit for the girls to remain at the school for a number of years; but in that case they were paying for their education, and I think they valued it more.

18. Have you noticed during the last few years any deterioration in the standard of education in the girls who now come to you as compared with those in the past?—Yes, I think so. I think most of the girls now are much weaker on the memory side of their intellect than they used to be, and they do not reason out the subjects so clearly as in former times.

19. Do you think that probably may be due to the fact that the great majority of your pupils at the present time come from a different class to those who used to pay for their education?—I think that may partly contribute to it; but I have discussed the matter with experienced primary-school teachers, and they have told me they have noticed even in the primary-schools a difference in the mental calibre of the children.

20. Do you think that is due to the indiscriminate manner in which parents allow their children to go to evening entertainments at the present time?—I think that may contribute to it to some extent.

21. *Mr. Hogben.*] When you refer to a massing of the units, do you mean that a pupil might be enrolled as a free pupil in the Girls' High School and be allowed to take some work whilst she is there, say, in domestic science at the Technical School, and then that we should count these units as part of her work qualifying for a senior free place?—Yes.

22. *Mr. Kirk.*] Do you approve of the teaching of such subjects as shorthand and typewriting in high schools?—Personally I do not.

23. You think they should be left to a later stage?—Yes, or should be taught in the technical schools.

24. *The Chairman.*] Would you prefer that that subject which you regard as a technical one should be exclusively taught in the technical school?—Yes.

25. Do you think the present primary course is a sufficient preparation for the work of your school?—As far as I know it is, but I have had so little experience of the first-year pupils that I cannot pronounce very definitely upon it.

26. What, in your opinion, has been the effect of the free-place system: am I justified in saying that there has been a large departure of girls who would under other conditions have come to your school but now find their way to private secondary schools?—Yes, very large indeed. At present, supposing a girl has failed in her continuation examination at the end of the second year, if her parents are able to afford it she is often taken from the High School and sent to a private school.

27. And from the material you now draw upon, you are satisfied there is a strong desire on the part of parents that their children should enter into the labour field as early as they can?—Yes.

28. How can you counteract that and stop the leakage you referred to? Do you think that the girls who do not go through a thorough course at the secondary schools should be required to go into a continuation school, day or night, rather than that they should go to you and stop only one year? Can they do any good educationally by marking time for one year in your school? —Well, I think that the better class of pupils have an advantage even through staying one year at the High School.

29. That is your well-considered opinion?—I think so, but I have not really considered the matter very thoroughly, because I have not seen exactly how this trend can be stopped.

WILLIAM MCELREA examined on oath. (No. 38.)

1. *The Chairman.*] You are Rector of the District High School at Balclutha?—Yes, and I have held that position for sixteen years. I am a Bachelor of Engineering of the Royal Irish University.

2. I understand you attend here to-day as the representative of a committee set up to look into the work of the secondary department of the district high schools, and also the manual and technical work?—Yes. I would first say something about the work in the secondary department of the district high schools. We think that secondary assistants should be better paid. There is a disinclination to take up these positions, because the work owing to the number of classes and the number of subjects is very heavy. In most subjects there are first-, second-, and third-year courses. In the Board's Senior Scholarship Class D, and in the Junior Civil Service Examinations, we have to compete against the high schools with fuller staffs. Owing to the great amount of written work done in the secondary departments of these schools as compared with the amount done in primary classes, much time outside of school hours is required for correction of work and setting of test papers; consequently all first assistants in secondary departments of these schools should be paid at least as highly as any first assistant in a primary school. I consider £300 a year should be the salary offered. The position does not lead to promotion in the service. Besides, as soon as some experience is gained, assistant teachers find more congenial and often better-paid positions in high and technical schools. I have now the fourth assistant in five years. Three left to take appointments in high schools. The fourth will likely follow if a salary commensurate with the work is not forthcoming. As to additional assistants, I have referred to the number of classes and of subjects, and consider that a fuller staff than is at present granted is necessary. The desire for education is becoming more general throughout the country, and these district schools provide, or should provide, a good secondary education near the pupils' homes. Efficient staffing is necessary for their continued success. We think the head teacher should have a freer hand in the distribution of his time. With the head teacher tied to giving the greater portion of his time to the primary-school work, the senior pupils are to some extent deprived of the stimulating influence and teaching-power of the most experienced member of the staff. Where head teachers have had a wide experience in this secondary work it would be better to give them the opportunity of exchanging more frequently with members of the secondary staff. Supervision in the way of visits from departmental Inspectors should not be necessary. It is not considered necessary for the primary schools, neither should it be for the secondary departments of the district high schools, which have been always very closely cared for by the Board's Inspectors. Every year we furnish a report showing the classes, subjects, scope of work, time given to each subject, the names of the teachers, and their qualifications. This report should show the work attempted, and our Inspectors could be relied on to see it carried out. Though a departmental Inspector may allot marks for promotion, it is the Board's Inspectors who, I think, invariably allot these marks. Manual and technical Inspectors could be freed from this work in primary schools, their services being retained for technical and trade schools where expert Inspectors are required. I wish to deal now with the rural course. Owing to the importance of rural education and the enthusiastic way in which the rural course of instruction is being taken up in the Dominion, provision should be made that a certain number of Junior University Scholarships or Senior National Scholarships should be allotted for proficiency in the subjects of this course. At the present time a pupil who spreads his energy over the subjects of the rural course is heavily handicapped in the competition for any of these scholarships, as the marks given for Latin are much higher than those given for the sciences; and two sciences only carrying 600 marks each may be taken. Latin alone carries 1,500. Physiology and agriculture, which are compulsory under the rural course, cannot be taken for these scholarships. These scholarships, if established, would lead up to a science degree. Pupils who, on gaining an Education Board Junior Scholarship, enter a high school can at once specialize on

such subjects as lead, through the Education Board Senior Scholarship, course D, to the Junior University Scholarship, whereas if they attend a district high school they must take the rural course embracing several sciences. Latin may be given a preponderating weight in what may be called literary scholarships, but provision should be made for candidates specializing in rural science, owing to the vastly greater number to which this course appeals, or should appeal. As to nature-study, in training colleges better provision should be made for, and more attention given to, nature-study. I think much valuable time is wasted on this branch of education through teachers' lack of aim and method. Agriculture should receive more attention in the training colleges, and students might have the opportunity of specializing in this branch on experimental farms, or in certain district high schools favourably situated for such work, where arrangements might be made for special classes under the Board's instructors. If Boards had a freer hand, much might be done in this direction. The aim should be that the teaching staff of a school should be able to carry on the work in rural science and domestic science. The permanent teacher, if properly equipped, would be a greater power than the visiting teacher. As to manual training, in woodwork in primary classes the making of useful articles should be encouraged. The training need not be less effective—indeed, I think it would be more so, as far as more interest would be taken in the work. The use of the sewing-machine should be allowed and encouraged in the higher standards. Woodwork and cookery in secondary departments should be optional subjects for Junior Civil Service and Senior Free Place Examinations. If advantage be taken under Regulation 7, (*c*), of recommending pupils for senior free places, the units of work put into woodwork and cookery may, I presume, be counted and receive credit; but if the pupil submits to examination these subjects have no place, altough one-twelfth to one-fifteenth of the school time be given to them. For a competitive examination there might be some difficulty in examining, but for non-competitive examinations a certificate from the Board's Inspector that the prescribed course had been completed should be sufficient. As to nature-study in primary schools, all city schools should be furnished with a plot of ground, not for the purpose of teaching gardening, but for the purpose of allowing pupils to see plants growing under natural conditions—not in pots in school-rooms. More interesting and more effective work could be done. The expenses incurred by pupils while attending centres for Proficiency, Civil Service, and Matriculation Examinations should be refunded. Pupils living in outlying places are often put to considerable expense in travelling to and from these centres. I would suggest that the number of returns might be reduced. We have to supply the following quarterly returns: (1) Quarterly attendance; (2) conveyance returns; (3) reports on National Scholarship holders; (4) reports on Education Board Scholarship holders; (5) certificate respecting free pupils; (6) lists of entrants and removals of free pupils, and (7) boarding returns. We have also to supply the following annual returns: (1.) One showing subjects taught classes in each subject, the number in each class, the units of of work in each subject, and the teacher of each class, and the work proposed for the year. (2.) Return of free pupils, giving date of birth, class of free place, clause under which held, and date of expiry of free place. (The same information regarding pupils is supplied two or three years.) (3.) Application to have technical and manual classes recognized for following year. These must state—(*a*) The scheme or course of work proposed, (*b*) hours given to it, (*c*) the approximate roll number in each class, (*d*) what material or apparatus may be required (Form III). (4.) Application for recognition of classes to be held in cookery, botany, elementary agriculture, chemistry, physiology, woodwork, &c., with roll number in each, day and hour of meeting, term, and name of teacher (Form IB). (5.) Separate rolls to be kept for each of these subjects. (6.) Claims for capitation for classes sanctioned in Form III (Form V). (7.) Claim for capitation for classes sanctioned in Form 1B (Form II). I grant that many of these returns are absolutely necessary, but I think in many cases they might be simplified. The capitation system of providing manual and technical training should be abolished. The system is unwieldy, and possesses other bad features. A striving after capitation grant is not to be encouraged, however necessary that grant may be to the finances of the Board in trying to push forward a desirable means of education. A direct grant on a *per capita* or some other basis would be far more satisfactory to the Board, and its administration by the Board would be more effective. The local Inspectors would demand from each school the work it might be reasonably expected to do. While one school could give an hour and a half to hand-work in, say, Standard II, another might be able to give only three-quarters of an hour. The present system involves so many returns that require checking in the Board's office, and are, I understand, again checked in Wellington, that there seems to me to be an enormous waste of time involved. I must say that the inception of a new branch of education necessitated some such system, but the sooner it can now be superseded the better.

3. *Mr. Davidson.*] In reference to the suggestion that the salaries of assistants in high schools should be increased, you say the minimum salary for a first assistant in any district should be £300?—Yes.

4. Would you allow such a salary to assistants in very small district high schools where the attendance is about twelve?—That is a class of district high school I have not had much experience of. I know that the assistant would require to be well equipped if he is going to do any good work, and therefore I would say he should get the salary.

3. Do you think the establishment of such schools should be encouraged?—No. I think twelve is too small, and I would increase the minimum number of pupils required.

6. You spoke of the difficulty experienced by assistants of gaining promotion from these schools: would you approve of the Board having the right to appoint teachers in all schools under their control, as in the case in Auckland and Wanganui?—I believe in that system.

7. I take it you approve of one controlling body having charge of the primary, secondary, and technical education within their district?—Certainly; I cannot see any reasons against it, and I can see many for it.

8. Do you think that woodwork instruction should be left until a boy has gained his proficiency certificate?—No. I think it should be taken in the Fifth and Sixth Standards.

9. Do I understand that you suggest as a means of avoiding this unnecessary clerical work in connection with returns that the payment for these subjects on a capitation basis should be abolished?—That is my opinion. I think the Department should be in a position now from its experience of the last few years to lay down a basis for granting a lump sum to the various provinces for carrying out the work.

10. Have you noticed that the percentage of schools taking manual work in the primary departments varies from 26 per cent. in one district to 97 per cent. in another?—I have not noticed that.

11. You suggested that the capitation basis of payment leads to strenuous efforts being made to gain capitation grants in certain districts and less strenuous efforts in other districts?—Yes, it does.

12. So, really, these subjects may be looked upon in some districts as capitation winners?—Yes.

13. *Mr. Wells.*] I should like to know what you would make the minimum for a district high school as a reasonable number to carry a salary of £300?—I should say eighteen, at any rate. I think the teacher who manages eighteen pupils and gives them all the education they require would have all his work to do.

14. Do you think the present education districts might be enlarged?—I am quite of that opinion: some of them might be, at any rate.

15. *Mr. Hogben.*] Do I understand that you object to the payment of the grants for manual work on a capitation basis?—No, I do not object to it on a *per capita* basis for the whole province: I object to it per class.

16. You would not pay the same grant in a district where 26 per cent. of the schools took manual work as you would in a district where 97 per cent. took manual work?—I do not understand why that should be the case. I would make it compulsory, and leave it to the Inspectors to say how much should be taken in each school.

17. If that were the fact you would not give the same grant to the two districts?—That would have to be arranged so that the difference could not exist.

18. You would make the subject compulsory in order to get an easier way of paying the grants?—I would leave it to the Inspectors to carry out the work.

19. Are you aware that where pupils who are candidates for senior free places take woodwork that the certificate of the Board's Inspectors is accepted and the subject is given full weight in the examination?—I am not aware of that.

20. You are not aware there is a form supplied for that purpose and that that is the present practice?—No.

WILLIAM SANDERSON FITZGERALD examined on oath. (No. 39.)

1. *The Chairman.*] You have been an Inspector under the Otago Board for a great number of years?—Eighteen years.

2. And before that you were what?—I was Rector of the Training College for sixteen years, and before that Rector of the Oamaru Grammar School for six years, and before that headmaster of a small country school in Canterbury for nine years.

3. Have you any suggestions to make for the better administration of education in the Dominion?—I am not prepared to make an address, but there are one or two points in which I am interested. I am still very much interested in the training of our teachers—naturally, having been at the head of the Training College so long. When I was Rector of the Training College the syllabus for the teachers' instruction and examination was much simpler than it is at present. There were fewer subjects. I dare say I am right in saying that the examination-papers were quite as difficult as they are now, but, having fewer subjects, we were able to present our students for the certificate examinations with considerable certainty of success. In fact, failure, if you look at the back records of the Training College, was exceptional, and so we were able very materially to reduce the number of partially certificated or uncertificated teachers in the Otago schools. We were able to send teachers throughout the length and breadth of New Zealand, and they were welcomed in almost every province. The point I wish to make is this: that the smaller number of subjects gave us time for practical work, and that practical work certainly told most effectively, not only on the students, but on the schools to which they were afterwards appointed. How the Training College is able now, with the number of subjects it has to tackle, to give the practical work that is necessary to secure efficiency for our young teachers I cannot tell. I do not see how I could arrange to give them anything like the practical work that I could do in the old days. I can give you one example: Every sixth week our students were distributed throughout the city and suburban schools, where they were welcomed by the head teachers and the assistants. They studied the methods of the teachers at the schools. Having made acquaintance with a class in the school, they took part in the teaching of that class under the supervision of the class-teacher. Before they left the school they taught a criticism lesson under the supervision of the headmaster, and the headmaster sent me in not only a report on that criticism lesson, but also a report on the work they had done during the week. We were immensely indebted to the loyal support given us by the head teachers and assistants in the city and suburban schools. I never heard that the practice of our students was any hindrance to the progress of the classes. If it was so it was never brought before me. The records of the examinations of the Otago schools will show that the practising school of the Training College occupies no secondary position in status so far as examination results are concerned. I must say the Otago Education Board gave us every consideration in the appointment of our staff. I think in the appointment of every

teacher on the practising staff as well as those in the training department I was consulted by the Board, and never once did they go contrary to my opinion. It was a heavy responsibility to place upon me but I gladly accepted it. In drafting the original regulations of the Training College I inserted a provision that the work done in the Otago University should be considered as part of the work done in the Training College, and that the professors' reports should be accepted by the Board as sufficient evidence of the work having been done by the students. It was the first time, either in England, Scotland, or anywhere else, that I know of that such a provision was made in connection with the training of teachers. The Otago Board willingly accepted that when I laid my draft regulations before it. We know now what education in New Zealand owes to that provision. I would also like to say something in regard to the uncertificated teacher. My knowledge of the work of the uncertificated teachers leads me to say that too much is being made of their presence in the schools of the Dominion, and that scant justice is being done to many of them. To one who is unacquainted with the changed examination conditions it may seem strange that, notwithstanding the increased number of entrants to the training colleges, their higher literary status, and the higher efficiency of the colleges, the number of uncertificated teachers in the schools of the Dominion should be so large. Again, it may seem strange that, although the number of uncertificated teachers in the Otago schools is nearly one-sixth of the whole number, the efficiency of the schools should be so high—69 per cent. "excellent" to "good," and only 4 per cent. below "satisfactory." From this it is evident that the majority of these uncertificated teachers are fairly well qualified for the duties they have undertaken. That need not surprise us when we consider that a fair proportion of them are trained and partially certificated, and that but for a change in the examination conditions they would almost certainly have held at least the E certificate, a certificate held by between thirty and forty of the Otago teachers, many of whom deservedly occupy high positions in the service. A fair proportion of the remainder have come from the secondary departments of district high schools, and so faithfully practise the methods of their elementary teachers that the Inspector may identify by their methods the schools from which they have come. In the earlier days of the Otago Training College first-year students were required to take the E certificate examination and so become certificated. They were also required to take the Matriculation Examination, and so by success in both examinations secure the D certificate and entrance to the University. A few on entering held a partial pass for D and were required to complete their certificate. If prepared for the University they were encouraged to take one or possibly two of the classes. Now the certificate standard is much higher. E examination has been abolished, and the requirements for D and C have been materially increased. That the partial pass for D or C is a fair qualification for temporary appointment is evidenced by the Inspectors' report to the Education Board. Of the schools officered by uncertificated teachers comparatively few received an efficiency mark lower than "satisfactory." It is not necessarily a disadvantage to a school to have a teacher with only a partial pass for certificate. It is an immense advantage to scholars to have a live teacher, and certainly the mental activity accompanying a reasonable amount of study for certificate will make for life in the school-work. I would urge that an uncertificated teacher who is making a reasonable effort towards securing a certificate, and presents a school or class in at least "satisfactory" condition, should not be subject to the 10-per-cent. reduction of salary, but should receive the full salary belonging to the grade of the school.

THOMAS SCOTT examined on oath. (No. 40.)

1. *The Chairman.*] What position do you occupy?—I am Chairman of the Board of Managers of the Technical School in Dunedin. I have been connected therewith for a good many years. I have had nothing to do with primary education; my sole connection has been with technical education right through. My remarks therefore will apply to the control of the technical part of the teaching throughout the province, and not to the literary side. It is well known that a great many advocate one control for the whole education of the province or whatever district may be laid down. To that I am totally opposed. I consider it would not be to the advantage of technical education if such a change were made. On the Board of Management of the Dunedin Technical School we have various tradesmen, and those tradesmen are the backbone of the manual classes at that school. Until we got a carpenter on the Board the woodwork classes were a misnomer. It is only when you get practical men—blacksmiths, engineers, and carpenters—on that those classes become efficient and fulfil the purpose for which they were instituted. We have examiners outside those who are sent down from Wellington. We have tradesmen who examine the work of each individual class. Of course, there is no charge made for it. This was not the practice three or four years ago, and when we got a report made upon the work done, the report was to the effect that the woodwork was badly designed, was fudged, and not a credit to the teacher. However, that was soon rectified, and for the last two years I am happy to say as a tradesman myself that some of the work done in that school would be a credit to any tradesman. The examiner in plumbing said definitely this last year that some of the work done by the apprentices attending the plumbing class could not have been done better by some of the journeymen in the trade. Now, if you bring the whole thing under one control you do away with the advantage of having those practical men on the Board of Management. And we must not forget that the Technical School is to a certain extent kept up by voluntary contributions, and those subscribers have the right to appoint so-many members on the Board of Management. If this is put under the Education Board you will do away with the voluntary subscribers, and the interest now taken by those outside in technical education will die out, and the work will accordingly suffer. Within the last two years the percentage of scholars taking purely technical education has increased considerably. I suppose, speaking from memory, 50 per cent. of the scholars attending the school have been taking purely technical instruction, and the tendency is still in that direction as against the purely literary.

Now, the question of overlapping has been discussed a good deal lately. Personally, I do not see how you are going to overcome that to any great extent. No matter what Board controls you will have a certain amount of overlapping. I will give an illustration: Some of our scholars at the Technical School were in the habit of going to the other school for drawing. Now, while they were away we lost control of them altogether, and we found that to be so unsatisfactory that in several instances we arranged to have the drawing given by the same master in the Technical School so far as we had the room available. We are of the opinion that the drawing in connection with the Technical School should be given in the Technical building. It is necessary for the control of the scholars attending the school. Then there is the question of free-place holders leaving school before their term is up. Last year the Dunedin Technical School lost in capitation about £300 from scholars leaving before the term was up. We have taken advice, and find that, although we may get the parents of those children to sign a declaration that in the event of their children not keeping up their attendance sufficiently to guarantee us capitation they will refund the amount due, we have no legal authority to enforce that. It is simply a moral obligation on the part of the parents. I think that is a point worth considering. I think some action should be taken to enforce payment of that amount. With regard to manual instruction, I consider that the teaching of woodwork in the ordinary schools is simply a farce. As a tradesman I can give my reasons. Until a boy has reached a certain age he is physically unfit to use the tool necessary for woodwork—that is, the jack-plane. I admit those in charge of the management try to overcome the difficulty by giving the boys smaller jack-planes than those used in the trade. Now, the carpenters in their trade use three planes—the largest is the trying-plane, the next the jack-plane, and the smallest the smoothing-plane. The last-named really requires more strength and effort to use than the jack-plane. If you look at a lot of the work done by those boys you find it very rough. The planing is a series of jumps, because the boys have not the strength to hold the tool in position. The work done at that stage is harmful rather than helpful, as it takes them a considerable time afterwards to unlearn what they have learned at the schools. Nine-tenths of the tradesmen in this town will tell you the same. I refer to woodwork only—in the primary schools. As regards cookery for the girls, I believe that to be beneficial. One of our greatest difficulties here is to get qualified teachers for the technical subjects, and our great want is instruction for teachers for the technical school; and I believe the day has arrived when provision should be made in the leading technical schools in the large centres for bringing up qualified teachers for teaching technical subjects. A great many of the subjects taught in the technical schools are not provided for in the district high schools. The tendency in the technical school is for each man to be a specialist in a certain subject, and he teaches the one subject all the year round in the various classes. For instance, take the domestic course alone—there is one man there teaching physiology alone to the different classes, so-many hours a week to each class. A great many scholars come to the Technical School for commercial education because they know there is a specialist in book-keeping there to instruct them. This gentleman, who is a book-keeper in one of the big firms, can come in the evening and do good work. As regards the day school, it is impossible to get men who are in good positions to come and give instruction. Since the day school classes started we have, of course, more permanent teachers on the staff than we ever had before. In engineering we have now a full course. We have mechanics, the theory of machine-construction, mechanical drawing, and workshop practice, and we compel all the students to take the full course, leaving patternmaking an optional subject. It will be seen, therefore, that any interference in the work of the Technical School by any outside body would lead to trouble. At present the Otago Education Board have no right to interfere with the Technical School work. It is all arranged from headquarters in Wellington, and in that respect there has been no trouble whatever. We have got all we have asked for, and we have got it in such a way that it has been of the greatest advantage to us. We have been most economical, and since the Government took over the control of this Department we have always had a margin on the right side. We have already been able to spend from £400 to £500 on plant and other necessary things. That is all I have to say, except that I am strongly opposed to any interference with the leading technical schools in the large centres by any other body, because the management is totally different from the management of an Education Board.

2. *Mr. Wells.*] Suppose the Board of Education were given control of primary, secondary, and technical education, if they had power to secure the services of such men as you speak of for assistance in technical work, would there be objection to that?—No, except that many of those men would not care to take subordinate positions under such a Board.

3. It would be an equal position as regards technical education?—Not if they had the right to interfere in the work of the school. I, for one, would not take any secondary position.

4. You are not a believer in the teaching of woodwork in the primary schools. Were you speaking from the tradesman's point of view or the educational point of view?—Both.

5. You think it is of no value from the educational point of view—training of hand and eye?—No. Training of hand and eye could be done better in other ways. Drawing and geometry would be of far more benefit to those lads in after-life.

6. Do you think this woodwork in the public schools has given boys a bent for trade rather than for clerkships and office-work?—I do not think so. I would much prefer to take a boy into the joinery trade who had been taught no woodwork. The boy who had been taught woodwork would have to unlearn so much before he was of any use. As I have said, I approve of the teaching of cookery.

7. *Mr. Kirk.*] Would you approve of the attendance at these technical schools being made compulsory?—No. I think the earnestness of the scholars would be reduced considerably, and there would be less attention to the work. A boy who was forced to go there against his own wish would do nothing, and that would have its influence upon the whole class.

8. *Mr. Pirani.*] Do you know anything personally of the woodwork that has been done in the primary schools?—Yes.

9. Do you mean to tell this Commission as an expert that the woodwork done there shows signs of the jack-plane jumping on the work?—Yes.

10. Look at these pieces of woodwork [produced]: can you see any signs of jumping on that?—In the first place, there is not a piece of woodwork here which would show the marks of a plane. It is broken up into small sections, you see. You want a piece of wood about 4 ft. by 6 in. to judge of planing-work. We do not consider that work. As far as it goes it is right enough. This large piece shows faults.

11. Would you expect better work from the children in the Technical School of twelve to fourteen years of age?—No, because I do not think they are fit for it.

12. Do you mean to say it would be of no benefit to the boy undergoing it?—No; it would be a disadvantage.

13. You told us just now that one of the difficulties of changing the management from the Board of Managers to the Education Board was that it would result in a decrease in voluntary subscriptions?—Yes. The voluntary subscribers have the right to elect a certain number of the Board of Managers, and if there was outside control there would not be the same interest in the work from outside.

14. Do you know anything of the effect in other districts where the Board of Education has supreme control of technical education?—I know a little.

15. Do you not know that while in Dunedin your total subscriptions come to about £300, in little Wanganui, where the Education Board has control of technical education, they have been able to raise £4,000?—I do not think you are quite correct. Last year our subscribers put up considerably over £1,000, and there are promises up to £3,800. We have set out to raise £5,000, and it will be raised this year. That is all we want.

16. Does it not strike you that if the control is changed people will not be less generous than at present?—It depends entirely on the kind of management.

17. Do you not think one effect of a change of management to the Education Board would be to prevent overlapping of high schools with the technical schools, which would be an advantage to both?—I do not think it would prevent any overlapping.

18. Have you had any experience of technical education work outside Otago?—No. I have visited other places, of course.

19. Do you know that in the Auckland District they have raised in contributions nearly four times as much as in Dunedin?—I know they are always in trouble financially in Auckland over the technical-education question.

20. Then you think absolutely the technical school should be in the hands of people outside the Education Boards?—Yes, under the control of the central authority. I do not believe in centralization locally at all.

21. *The Chairman.*] Is it not a fact that technical education in New Zealand owes its origin to local effort in Otago, when the people carried the burden on their own shoulders for years because the Education Boards and High School Governors would not look at it? You as a tradesman say deliberately that manual instruction in the primary schools is worthless?—Yes.

MONDAY, 17TH JUNE, 1912.

FRANK MILNER examined on oath. (No. 41.)

1. *The Chairman.*] You are Rector of the Waitaki Boys' High School?—Yes. I have been six years in my present position, and previous to that I was first assistant in the Boys' College, Nelson. I am an M.A. of the New Zealand University. I have to apologize for the absence of my Chairman, Mr. John Buckley, who proceeds Home to undergo medical treatment this week; and also for the absence of Miss Ferguson, Lady Principal of the Waitaki Girls' High School, who, owing to the loss of an assistant, finds it impossible to attend the Commission. First of all I wish to emphasize the necessity of the introduction of sound teaching on sex physiology into our schools. I am in hearty agreement with the resolution recently passed by the New Zealand Educational Institute affirming the desirability of the departmental appointment of expert lecturers on this delicate but vital matter. I am glad to see that the Wanganui School Committees' Association has indorsed this resolution. I know that Mr. Firth, the headmaster of Wellington College, is heartily in favour of the proposal. Speaking for myself, with full consciousness of the grave responsibilities attaching to a position when I am *in loco parentis* to 160 boarders, I can say that I should not dream of retaining such a charge unless I had a free hand in providing sound expert instruction on sexual hygiene. There can be no doubt that such teaching is best given through parental channels, but all my experience leads me to recognize reluctantly that parents shamefully neglect their obligations in this matter. If the generality even of parents were to follow out the advice given by the Hon. Edward Lyttelton's book "The Training of the Young in the Laws of Sex," there would be little left for the schools to do in this connection. A doctrine of pusillanimous reticence about their vital physiological processes defeats its own end. Nature provides such an active curiosity on the subject that unless right and clean instruction is given knowledge is gained in perverted and haphazard ways, and vitiated information often sullies for ever what should be perfectly sound and innocent. If the right presentation of the case of the propagation of life is given first, it will futify a normally constituted boy's mind against all the perversions of pruriency. The recent manifesto of the British National Council of Public Morals attests the gravity of the matter. It represents the opinions of a very eminent body of men prominent in the spheres of religion, science, and education.

Among the signatories are six Bishops, the heads of all the great Protestant Churches, Professors Sir W. Crookes, Sir T. Oliver, Sir William Ramsay, Sir Clifford Allbutt, Sir Victor Horsby, and Sims Woodhead, and Sir Thomas Clouston, &c. The manifesto expresses alarm at the low and degrading views of the racial instinct now being circulated. Many causes are contributing to the evasion of the great obligation of parenthood and the degradation of the marriage tie. Attention is drawn to the corrupting influence of the circulation of pernicious literature which has to-day reached an extent and developed a subtle suggestiveness without parallel. In the words of the manifesto, "Our systems of education too frequently ignore the sacred and responsible functions which confront the young on reaching maturity. The tendencies of the age make it imperative that they should be taught to entertain high conceptions of marriage as involving duties to the future of the nation and of the race. The great truth must be enforced that the racial instinct exists not primarily for indvidual satisfaction, but for the wholesome perpetuation of the human family. Such physiological knowledge should also be imparted as should protect our youth from those who would seduce their innocence or trade upon their ignorance." The *locus classicus* on sexual hygiene is Chapter vi in Volume I of Professor Stanley Hall's monumental work on "The Psychology of Adolescence." He says that in his opinion scientific discussion of the subject is imperative for educators. It is a painful duty, but that affords no excuse for the criminal neglect of this department of sex physiology. In the case of bright and nervous children pubescence often dawns with fulminating intensity, and sweeps the boy into pernicious ways long before moral or even intellectual restraints are operative. Professor Stanley Hall's sane and scientific discussion of the whole subjects marshals a grievous array of evidence in support of his contention that public instruction in our schools is clamantly required. He shows how normal puberal manifestations constitute a distinct group of psychological phenomena which are only too well known and exploited by unscrupulous quacks. There can be no doubt that the false and morbid modesty bred by our hyper-sensitiveness in regard to sex matters is responsible for a terrible amount of remediable mental anguish in the young. The eminent mental specialist Sir Thomas Clouston, in the course of a recent speech delivered at the Mansion House, London, spoke of Professor Stanley Hall's work as a masterpiece worthy of careful study. I wish to congratulate the Department on the compilation and introduction into our schools of the wall temperance charts. In view of the advanced scientific teaching of the nature of alcohol given in all the schools of the United States, and in view also of the great manifesto signed by over 14,700 doctors of the United Kingdom and presented to the Department of Education, advocating among other things scientific instruction on the dangers of moderate drinking. I consider that every teacher who passes through our training colleges should be familiarized with the present scientific position as regards alcohol. The overwhelming laborating evidence in favour of total abstinence from alcohol which is contained in such publications as Sir Victor Horsley's "Alcohol and the Human Body," and Professor Sims Woodhead's lectures, and the record of Professor Kraepelin's classic experiments at Munich, should be familiar to every earnest teacher. The whole civilized world is awakening to a realization of the vital necessity of such instruction. In Germany the Kaiser, in America President Taft, and in England the Lord Chancellor, the Chief Justice, and the Lord Mayor of London have quite recently urged all teachers to practise and preach total abstinence from alcohol to their pupils. The authoritative pronouncements of men of the eminence of Sir Alfred Pearse Gould, Sir Victor Horsley, Sir Frederick Treves, Sir Thomas Barlow, and Professor Sims Woodhead in England, and Professors Eliott (President, Harvard University), Starr Jordan (President, Leland Stanford University), Woodrow Wilson (President, Princeton University), and President Taft, in the United States, in strong favour of the instruction of the young in lifelong abstinence from alcohol begun in any form cannot be brushed aside by cheap cynicism. Such influential opinions illustrated by means of good lantern-slides of strict scientific accuracy which are now available cannot fail to make a deep and abiding impression on the plastic minds of the young. I say without the slightest reservation that the scientific position for total abstinence from alcohol is now impregnable, and that it is our manifest duty to impress this great fact on the young. With regard to secondary-school teachers, I should like to say that I am of opinion that there should be some form of previous training. It is necessary that there should be some previous training for secondary-school masters before they are appointed to take up responsible positions. I think you will find that the average secondary-school master coming fresh from the University gains his experience at the expense of his class for the first two or three years. I was myself appointed to a secondary school after taking my M.A. degree. I had had no training in the methods of teaching, and my first year or two was really a massacre of the innocents; and that experience is corroborated by others in the teaching profession. I think therefore there should be some form of compulsory training in practical teaching for secondary-school masters equally with primary-school masters. With regard to free-pupil entrants into secondary schools, I am perfectly in agreement with those who advocate that there should be a guarantee of two years study, otherwise they should be catered for in the upper standards of the primary schools. There is no doubt that early leaving entails expense on the taxpayers, and also disorganizes the work of the school. With regard to the University Junior Scholarship Examinations, which dominate the curriculum of the school, I would debar girls from competing with boys. It is the stiffest educational ordeal in the Dominion, and I think it puts too severe a tax altogether on the relatively more complex and highly organized nature of a girl. I would consequently advocate that a certain number of scholarships should be reserved for girls, and that in their course mathematics or science should be eliminated, the candidates to make a selection out of the two. In the distribution of marks in the scholarship examinations I would allocate more to science. I think that experimental science is a subject of the very highest importance. If at the same time certification is demanded of the headmaster of practical laboratory work, I think science should be on an equality with English and mathe-

matics. I would be inclined to reduce Latin to 1,000 marks, and advocate that history and geography should be put on the same mark as Latin. The allocation of these Junior Scholarship marks is undoubtedly a factor in determining the time given to the subjects in the secondary schools. It is made a bit of a fetish in New Zealand schools, and consequently I think the allocation of marks should be very carefully considered. In connection with the secondary-school curriculum, I consider that Latin is a vastly overrated educational agency. We are not yet at the consummation of that healthful evolutionary process which has been freeing us from educational bondage to the past. At one time the classics dominated the whole curriculum. At the present day, at any rate, in New Zealand, we regard the study of Greek as a palæontological curiosity; but, to use Lord Rosebery's phrase, we still look upon the Latin grammar with gloomy respect. Although I am a classical Honours graduate, educated in a classical atmosphere, I reduced the term devoted to that subject to a minimum in my own school, and unless the requirements of University examination or professional course necessitate its study, I always advise my boys to take up alternative subjects—*i.e.*, commercial units, agriculture, experimental science, &c. I have been teaching Latin for fifteen years, and see no reason to change the poor opinion of its educational value as a secondary-school subject which I formed fully ten years ago. It would be a waste of time to repeat the stock arguments in favour of the retention of Latin. Suffice to say, in my opinion, one's practical experience fails to substantiate them. I know of no other subject in the curriculum that breeds such intellectual cynicism and distaste. I have never been able to see what superlative educational virtue resides in the arid struggle through Latin-accidence with but a dusty perspective of Cæsar ahead. About 5 per cent. of those who take Latin in our secondary school reach University scholarship standard, and then alone have any chance of even a bowing acquaintance with Latin literature. And after all when a man does take Honours in Latin, what superlative mental advantages does he gain? Latin literature is a limited narrow-horizoned paltry thing when compared with Greek or English literature. Putting Catullus and Lucretius apart, one finds hardly anything in Latin of genuine nature, inspiration, or power. In most of the literature, equally with the philosophy, is a poor imitation of Greek. It has been my experience that the departmental valuation of subjects is very just, and based on liberal and progressive modern ideas. Personally I think that the conservation of our University Senate is responsible for the undue valuation attached to Latin. The subject is not necessary for a thorough command of the English language. What advantages it does possess are entirely outweighed by the fact that its retention in such a prominent place on the time-table thwarts the adequate treatment of more vital subjects. To me it seems an extraordinary thing that the General Medical Council insist on Latin for the Medical Preliminary and omit chemistry and physics from the scope of the examination altogether, although the two subjects are far and away the most important in the first part of the medical course. If in prescribing Latin they lay the flattering unction to their souls that this is a genuine culture subject, I am afraid that results do not tally with this supposition. I should like to see Latin always an elective subject provided with good alternatives. It should never be compulsory except for law examinations. A multiplicity of subjects looks imposing in a syllabus, but encourages a scattered dilettantism, and is responsible for lack of mental concentration and pretentious shallowness. With Latin eliminated or subordinated there would be ample time for the thorough treatment of history and geography, two subjects of primary importance. The inclusion of questions in general history and geography in the matriculation English paper was a very wise step. I look to the Department to do the same for the Civil Service English, and not to neglect New Zealand history when they do so. I am strongly in favour of the vocational tendency of modern education as interpreted by the Central Department. I consider that the fears expressed as to the dominance of utilitarianism and practical needs over true cultural education are groundless. English and English literature, combined with an adequate treatment of history (especially on the constitutional, social, and Imperial sides), and of geography (especially on the human side), provides an inexhaustible wealth of the best cultural material, which, in the hands of an efficient teacher, gives an inspirational uplift and a mental breadth and lasting intellectual interest to the pupils. Just as the Moseley Commission found it to be the case in the United States, so with us, English liberally interpreted must be the heart and centre of our educational system. There are unlimited potentialities of cultural and humanizing work in English literature. In regard to history, we want to fight carefully against any narrow philological treatment, and also against the fetish of annotated editions. I believe that the humanizing quality of English literature is what we should make the primary aim in the teaching of English. I would also emphasize the oral teaching of English in the primary and secondary schools. I do not think that a secondary school is one worthy of the name unless it has a good debating society in which the boys have an opportunity of discussing social, national, and Imperial questions. In America this is made a big point of in the curriculum of English. I consider that history has very great potentialities indeed, and I think it is a mistake to regard history and geography as studies for merely exercising the retentive faculties. I think there is great ignorance of the whole of the colonial portion of the British Empire, and if every teacher who takes history in our secondary and primary schools was conversant with books of the type of Captain Mahan's "Influence of Sea Power," and would read magazines like the *Round Table* and Dr. Dillon's articles in the *Contemporary*, for instance, and were to extract the living information in those stores, I am quite sure history could be vitalized to an extent that is not done to-day in the majority of schools. I am sure that with the teaching of history we should also add the teaching of civics. In this way we could give the boys a live grasp of modern questions, and educate them for the efficient use of the suffrage in the future. I think as a matter of fact that every boy who goes out of our schools should be a sane Imperialist, and should have a lasting interest in that from the study of history and the way it is presented to him by his masters. To me the subject seems one of endless possibilities.

Along with it I should have in every school a Navy League. I think that is a very great educational agency in the life of a school, and is able to put before the boys questions of the very greatest interest, and to enlist their sympathies in a way that would hardly be believed by the synic who pooh-poohs these things in everyday life. In dealing with geography and history, I think we can bring the boys face to face with the big questions of the hour—Imperial federation, preferential tariff, *ententes* and alliances, and so on. All these subjects can really be made part of history and geography in secondary schools, and that is why I claim they should have more attention paid to them, and should have a greater number of marks allotted to them in the Junior Scholarship curriculum. To teach geography and history thoroughly will give the boys a lasting interest. It has been said by dignitaries at Home that the average English school product can speak of nothing but school topics, athletics, and things of a narrow horizon like that, but I think we should aim at giving the boys a wide outlook. I am a strong believer in pictorial illustration, and would strongly advise the Department to purchase 10,000 slides from the best firms, and lend them out to the various Education Boards or schools, so that they might be utilized by means of the magic lantern for teaching geography. I know that the employment of these means vitalizes the lessons to an extraordinary degree. I have 6,000 slides myself, and they are in constant use in the teaching of science, history, and geography. I certainly think that history and geography liberally interpreted should be compulsory for teachers' certificates. I would also include a proper course of physiology and hygiene. This is a most important subject. It should embrace instruction in sanitation, first aid, rescue and resuscitation of the drowning, and on the nature and effects of alcohol. I consider that the headmaster of every secondary school should be required to certify that every pupil who stays with him more than, say, a year has been taught to swim and to rescue and resuscitate the apparently drowned. Failing a medical certificate of physical disability, this should be required of every boy. This vocational course has undoubtedly come to stay in the secondary schools. At Waitaki over forty boys, all of whom are going on the land, have taken up this course, comprising English, history, geography, arithmetic, chemistry, agricultural botany, principles of agriculture, agricultural chemistry, and practical field-work; mathematics is optional. There is an agricultural laboratory in addition to an experimental-school farm of 4 acres. This year we are adding dairy-work, wool-classing, and carpentry to the course. I have no hesitation in saying that the course has thoroughly justified its inception. It enlists the full mental energies of the class and generates in this lasting scientific interests. Personally, I have no fears that the tendency of our education is too prominently practical or utilitarian. The whole of my academic training was of a purely abstract and theoretical type. Since taking up the profession of a teacher I have come to realize that the so-called vocational subjects can convey as sound a mental training in accuracy and the other qualities as their sacrosanct elders in the syllabus.

2. *Mr. Pirani.*] How many free-place pupils have you in your school?—The Secretary to the Board has supplied me with the following statement dealing with attendance and salaries, as these are matters which fall within his province: "The total number on the roll this term is 236, of whom 156 are boarders and 80 are day boys. The total number of free pupils is 136, of whom 72 are boarders and 64 are day boys. The average number of pupils per master is 29·5. The utmost amount of capitation receivable by the Boys' School this year (making due allowance for pupils falling out during the course of the year) will be £1,700. The total amount payable in salaries to the staff this year is £2,261, consequently the statement made that the capitation of the free pupils pays almost for the education of paying pupils is incorrect. It may be pointed out in regard to the staff that the Rector does full-time work, being responsible for the whole of the English, Latin, French, and history of the two upper forms of the school, and the staff of eight is therefore virtually nine. The following are the salaries paid: Rector, £500; first assistant, £350; second assistant, £325; third assistant, £300; fourth assistant, £275; fifth assistant, £175; sixth assistant, £150; seventh assistant, £150; eighth assistant, £36: total, £2,261. The above figures, of course, apply to the Boys' School only."

3. Can you give any reason why the amount paid in salaries in the Waitaki High School is the lowest in New Zealand?—I am not aware that it is the lowest.

4. In 1910 you had 185 pupils, and paid £1,900 in salaries. In the Wanganui Girls' College they have one pupil more than you, and they pay £2,145, and it is the same right through. Do you think the salaries paid to your assistants are sufficient?—The salaries are all right. The roll-number has gone up very rapidly in the last five years, but the staffing has not gone up quite so fast proportionately. This year we have added an additional master, but the roll has not increased very much since then. There is not accommodation for a great number of pupils.

5. In 1910 you only had seven teachers for 185 pupils: do you think that sufficient?—No, and I told the Board it was not. We have an additional master this year.

6. Christ College, with only seven more pupils, has eleven assistants, as against your seven?—I am quite prepared to put our results against Christ College results.

7. You think you are sufficiently staffed?—No, I do not; but we cannot do everything at once. As soon as we get additional class-rooms we will appoint additional teachers.

8. Is there any reason why your tuition fees should be the lowest in New Zealand—£7 10s.?—I do not think there is any reason at all. As a matter of fact, the Board consider it is a democratic thing to make the charge as low as possible.

9. You would make the free-place pupils pay for the paying pupils. Is not that what it amounts to? Your income from the Government is £2,560, and you only pay £1,900 in salaries, so that, as a matter of fact, your free-place pupils are paying for your paying pupils: is not that so?—Certainly, the Board do not draw a great revenue from the paying pupils. I think the statement that the Secretary has prepared shows that that criticism is inapplicable to the school as it stands to-day.

10. Do you not think it is a fair thing that the paying pupils should pay for their tuition?—I have no objection to raising the fees to paying pupils.

11. I notice that the amount contributed by the Government to your institution in 1910 was nearly £800 more than you paid in salaries: where does that £800 go?—In buildings and equipment.

12. It is not contributed for buildings, surely?—Every penny that is over after paying salaries is devoted to equipment and buildings.

13. So that the free-place payments made to you are really more than sufficient for the return given to free-place pupils in the shape of tuition?—We have been receiving the limit of capitation from the Government, and every penny of it has been devoted to the equipment which the free-place pupils themselves enjoy.

14. Have you any idea of the amount of voluntary contributions on which you get subsidy from the Government?—£500 in 1910.

15. How was that contributed?—It was a donation to the Board.

16. By one individual?—Yes.

17. Who by?—Myself.

18. What was your salary from the Board of Governors?—£500.

19. The whole of your salary was given to the Board as a donation?—Yes.

20. Do you think that is a fair way of getting money from the Government?—Most decidedly.

21. Do you think if the Board of Governors gave you £1,000 salary it would be a fair thing to pay it back to the Board and get £1,000 from the Government by way of subsidy on it?—Any donation that is given to the school receives a pound-for-pound subsidy from the Government.

22. This matter of donations is a very vexed question right through, and it is said—and said with some truth—that it is being worked: I want to know if this is a case where it is being worked. Supposing a salary of £2,000 was given you, do you think it would be fair that you should hand that back, and that the Board of Governors should get another £2,000 on top of that?—It is no use putting a hypothetical case like that.

23. Well, come back to the £500 then?—If I feel that I can afford it, why should I not hand the money over to the Board of Governors. They have never asked me for a penny.

24. The system in the Wanganui Collegiate School at one time was that the Principal received no salary, but received the profits that were derived from the boarding fees: in your institution the sytsem is that the Principal received no salary because he gives it all back and gets another £500 from the Government for his institution?—Of course, the Board of Governors get £500 on the £500 which I present to them, but as a matter of fact I received the salary from the Board, and at the first I did not give it back to them. There were only thirty boarders when I first went to the school, and now there are 160, and we could get 200 if we had the accommodation. All the profits of the boarding establishment are mine. As a matter of fact, I did not want all the money, and handed over a certain amount to the Board. I am quite prepared to let the Board run the establishment, but they will not be bothered with all the details. For every pound I have handed over to the Board on which a subsidy was obtained I have spent £2 on the school which did not earn any subsidy.

25. *Mr. Davidson.*] In your opinion, how do the pupils entering your school now compare with those who entered five or six years ago?—I consider they are quite up to the standard of those who entered five or six years ago.

26. How do you find the free-place pupils?—I find them well equipped. We find that the standard of pass or certificates of proficiency vary in different districts. We have thirty pupils from the North Island, and we have them from all parts of New Zealand, and we find that the standard of efficiency varies with the different districts.

27. *The Chairman.*] Have you any pupils from Wanganui?—Yes, some; and seven from Hawera.

28. *Mr. Thomson.*] I suppose a great many of the forty who take the agricultural course come from other parts of the Dominion?—Yes.

29. *Mr. Poland.*] That is forty out of 250?—Yes.

30. Would you be in favour of compelling all the boys in your school to take the agricultural course?—No.

31. You have 160 boys who are boarders: what fee do you charge?—The fee is £16 8s. per term. It is eighteen guineas, including board and tuition, and sixteen guineas for those under fourteen.

32. How do you deal with a free-place pupil who wishes to board?—He would receive a rebate of the tuition fee; £2 10s. for the term.

33. *Mr. Kirk.*] Do you find that the free-place pupils coming to you at the present time have a reasonably adequate knowledge of history and geography?—Far from it.

34. You do not think that those subjects have that time spent on them in the primary schools that they should have?—That is so.

35. Do you teach such subjects as typewriting and shorthand in your school?—Both are extras, taken outside the ordinary school-time.

36. You would not approve of their being taken in the ordinary school-time?—Yes, I should. I am considering their introduction as a commercial course now, and I very likely shall do so in the near future.

37. Without sacrificing any of the fundamental subjects?—Yes. I insist on every one taking geography, history, English, and arithmetic.

38. Typewriting and shorthand are subjects that can easily be taken after a child has left school?—Yes; but if you take a specialized course you have one or two periods in the day vacant which could be well filled up in that way.

39. Do you advocate teaching sexual physiology only in the secondary schools?—No. I wish my remarks on that subject to apply to the primary schools as well as the secondary.

40. At what age would you teach it to boys?—Just before they reach the age of puberty.

41. Would you allow any teacher to teach that subject?—I should like to see experts appointed.

42. Do you think it is possible for any expert to deal with the subject *in globo* for a class of forty boys?—Yes, I have heard it done, and done well.

43. Is it not a fact that the best work is done privately, by interviewing each boy singly?—Both forms of work should be adopted.

44. Do you think there is any danger?—Yes, but the danger of reticence is infinitely greater.

45. Is it not possible for you to detect in any boy in your class any symptoms which might indicate to you that he should have some teaching?—You may, and then again you may not. There are any amount of cases where something perfectly natural and spontaneous might be troubling a boy, and their natural shyness and modesty will cause them to hide it and endure agony over something that is quite natural.

46. In such cases, would not teaching in the principles of hygiene be sane?—No, I do not think so. It is a matter that must be detailed and specific. I do not think that general talk is any good whatever. As a matter of fact, it is a department generally evaded by every teacher. Something ought to be done; of that I feel absolutely certain.

47. You give it as your considered opinion that the teaching of boys in a class would be of advantage?—Certainly. Of course, it must be undertaken by earnest men thoroughly conversant with the subject. I think it should be combined also with private conversation.

48. You do not think that private conversation should be the main factor?—I would not say it should not be the main factor, but I should have a public lecture on the matter as well.

49. In regard to history, do you find that the boys take kindly to complex Imperial subjects?—Yes. I get a splendid response.

50. In the way you are doing it very good results are obtained?—It is not for me to speak. All I know is that in their debating they have a very high standard indeed. I am very well satisfied with the results that have come from it.

51. Have you a library at the school?—We have over two thousand volumes. It is a general library, with all the leading works of reference and newspapers of the day. I consider a newspaper is as good a text-book as you can get.

52. Are the books largely availed of by the boys?—Yes. I keep a reading list, and take down the names of the books lent to each boy each term.

53. What value do you attach to the library?—A very high value indeed. I consider that every boy should know how to use a library, how to choose books, how to extract information from books, and so on. I think that is a very valuable part of a boy's instruction.

54. What physical exercise do your boys get?—Before breakfast they have half an hour's physical exercise—that is, the boarders—consisting of gymnastics alternating with Swedish drill. In addition to that they have an hour's military drill for the whole school during the week, and for the boys who do not take gymnastics before breakfast there are gymnastics after school.

55. *Mr. Wells.*] You spoke of the need for the training of secondary-school teachers: would you recommend that that training should be undertaken in the training colleges?—I think so. As a matter of fact, I have no definite scheme to lay before the Commission.

56. Do you think it would be any advantage if one body had control of all the education in the district, with the exception of the University?—I should always like to see local control, but I really have not considered the matter thoroughly. I think with local Boards we are likely to excite local patriotism.

57. Do you make any attempt to guide the reading of the boys in connection with the library?—Yes. I draw up a reading list, a printed copy of which is given to each boy, and the masters also inculcate in the boys what are the best books to read.

58. *Mr. Hogben.*] How many boys have you at present?—250.

59. How many come from the district in which the school is—North Otago and South Canterbury?—I should say, about half of them.

60. That is rather a bigger proportion than is usual, is it not?—Yes. I am rather surprised that Oamaru, with a population of five thousand, can send us as many as eighty-nine day boys.

61. And the outlying districts send thirty or thirty-five more?—Thirty, I should say.

62. What renders additions to the school necessary?—Pupils from outside the North Otago District.

63. Assuming that it is desirable to impart instruction in sex physiology, do you think that the person who gives the instruction should have expert physiological knowledge?—It depends on what is meant by expert physiological knowledge. I do not think expert medical knowledge is necessary.

64. Do you think he should be a man of high moral character?—Certainly; that is absolutely necessary.

65. Do you think he should have a knowledge of and sympathy with boys such as is possessed by a good teacher?—That is very desirable.

66. Do you think he should have a personal knowledge of the boys with whom he deals of such a kind that they will look upon the special teacher almost as a parent?—I think it would be better if he did, but I do not think it is a necessity.

67. Do you think if he did not possess that last characteristic his instruction ought to be confined to generalizations?—Let him have a general discussion first, and see each boy individually afterwards. That is what I advocate.

68. I think you said that general exhortations are of no value whatever: have they no value in raising the moral ideas of the boys in the direction of purity?—In many cases the general

exhortations go off a boy like water off a duck's back. In these matters I believe in frank and detailed physiological treatment.

69. Do you not think the influence of the prefects in secondary schools is a most valuable part of school life?—Certainly, it is of very great value.

70. Do you think the mass of the boys who learn Latin in the secondary schools read sufficient Latin literature to get a feeling of the spirit of it?—Far from it, in my experience.

71. If the mass of the boys do not learn Latin, would you think it desirable that they should take a course of foreign literature in English?—Yes, I should think it would be desirable. It would be corrective, and it would have a broadening mental tendency, and I think it would lead them afterwards to read by means of translations the literature of Greece and Rome and other foreign nations.

72. Which do you think is the most likely way in which the average boy will acquire a taste for this literature—by means of good translations or by a school course of a foreign language?—Undoubtedly, by translations.

73. *The Chairman.*] Touching the necessity for teaching civics in the schools, I take it you would be greatly in favour of holding debates on public questions in all secondary schools, and would you go so far as to say in all primary schools?—I am afraid my opinion in regard to primary schools would not be of much value. I should certainly think, though, that in the oral work taken in the upper standards of the primary schools the boys should be able to discuss the more elementary matters dealing with some of the broader phases of citizenship, and some of the international social questions of the day.

74. Would it surprise you to know that in this district in the past, when the syllabus was not so complex, that such a course was taken in some of our schools with great advantage to the pupils—that it is, as a matter of fact, acknowledged by them in many parts of the world that their success in life was largely due to the advantages they gained on these speech days?—I can quite believe it.

75. Therefore, being a wholesome study, you think it should be persevered with?—I certainly do. I know in regard to my own school that old boys have written and told me that they have found the study of civics and questions of the day that they had at the school of great value to them in University and business life.

76. Then, you would favour a course of instruction in civics in the Sixth Standard of the primary schools?—Certainly.

77. Is the primary-school course, in your opinion, a sufficient preparation for the work of secondary schools now?—As a matter of fact, I think that the study of history and geography might be augmented. But I am not prepared to say that the pupils who come to us from the primary schools are worse equipped than they were when I first came to Waitaki, because my experience is fairly limited. I am one of the youngest headmasters in New Zealand.

28. In your opinion, would it not conduce to the benefit of national education if a Council of Education were set up to advise the Minister on all questions relating to what I may term our educational code, and to supervise, as it were, the instruction given in the primary, secondary, and technical schools of the Dominion?—I am not prepared to say it would. As a matter of fact, as far as I see it as a secondary-school master, the administration by the Department seems to be very sound and progressive.

79. Can you tell me what proportion of the pupils of your school take the agricultural course, and the districts those who do so are drawn from?—There are forty-eight boys taking the course, and they come from—North Otago, 21; South Otago, 10; Marlborough, 1; West Coast, 1; Southland, 1; Canterbury, 10; and North Island, 4: making a total of 48.

80. Are you acquainted with the position that Denmark occupies as a producer?—Yes.

81. Is it fair to say that the success of Denmark as a producer is largely due to the quality of the agricultural instruction given to the pupils in the high schools?—I am sorry to say I am not acquainted with the course of instruction given in the high schools of Denmark. But I am strongly of opinion that if the agricultural course is properly taken up, with adequate laboratories for experimental work and adequate room for field experimental work, under expert supervision, it will make a big difference for the better in the primary industries in the years to come. I consider that the vocational course introduced by the Department is of very high value, and will ultimately justify itself in the development of our primary industries.

William John Morrell examined on oath. (No. 42.)

1. *The Chairman.*] What is your position?—I am Rector of the Otago Boys' High School, and have held that position for the last six years. Before that I was chief master of classics and English in the Auckland Grammar School. I have been teaching for over twenty years—for the last fifteen years in the Dominion. I have also made a considerable study of the history and theory of education. I am an M.A. of Oxford University, and late Scholar of Balliol College. I wish first to say a little about primary education. As to the cost of primary education, and as to details which can only be judged by those engaged in the daily working of the system, I shall offer no opinion. I shall only speak of those general aspects which have come within my view as a secondary teacher and headmaster, receiving each year a large number of boys who have passed through the primary schools, and as one both personally and professionally interested in education. Speaking broadly, and judging mainly from the pupils who join us with Sixth Standard proficiency certificates (virtually all our new entrants), I believe that the results of the system are satisfactory, and that the work of the primary teacher, considering all the circumstances, has been well done. Of the two most important subjects, I should say that the arithmetic is decidedly better done than the English. As regards the latter, my impression is that in many cases there has been too little practice in reading for understanding, so as to appreciate the general drift of what is read, and

that too much attention has been given to isolated "words and meanings": thus both thought and imagination are insufficiently trained. From this point of view, I should think it better to let the Sixth Standard at least have one continuous reader, which the pupil might be expected to get through at home, only portions being taken in school, with general questions on the rest. This would also tend to foster a love of reading, and to develop the power of grasping what is read as a whole—a most important thing, reacting on the work in most school subjects. The neglect of history is a most serious blot. Few boys know anything worth mention about this really vital subject, the exceptions being generally boys who are distinct lovers of reading. There is, however, another important exception: thanks to the Otago Navy League, and to the teachers taking up its essay scheme, the greater names at least in our naval history are usually familiar. The syllabus in itself appears to be quite satisfactory, if the pupils really acquired a knowledge of its topics. Such knowledge would seem to depend partly on the habit of "reading for understanding," mentioned above, and still more on the living interest given to the subject by the teacher, who must therefore himself be able to vivify and enlarge the matter contained in the book. History should, in my opinion, be a compulsory subject for all teachers. I am convinced that what is really required to raise the historical teaching in primary and secondary schools alike to a higher level all round is the establishment of a chair of history at one of the universiay colleges. The example would soon be followed elsewhere; history would be more adequately represented in the University curriculum; and the influence of the students so trained would be quickly felt in our schools. As regards geography, the mathematical geography required in Standard VI is too hard, and appears to be profoundly uninteresting to most boys. My own feeling is that it would be advisable to reduce it and to lay more stress on the human aspects of the subject. Geography is another subject which would be much advanced by being treated as a University subject, a thing which should be perfectly feasible, in more than one way. The great advance made in England in the teaching of geography of late years is largely due to the lectures and work of men like Professors Mackinder and Lyde and Dr. Mill. Another subject recognized in England, Germany, and other countries as of high culture value, and one which in my opinion is far from satisfactory in most of our schools, is vocal music. I believe that more careful attention should be given to this, and in connection therewith to habits of clear enunciation and of correct and pleasing delivery of word-sounds. These criticisms, which I offer with due diffidence, are not to be regarded as invalidating the generally favourable opinion above expressed. They merely point out the directions in which I should personally look for improvement. The syllabus is, I believe, a good one, and represents a well planned effort, along modern lines, to make the children think, and to effect a well-balanced development of their powers. I do not share in the condemnation of hand-work expressed by some secondary teachers and others; on the contrary, I think it should be, when properly taught, a valuable element in all primary education. Nor do I see that any of the subjects in the syllabus can well be dispensed with. It is thought by some whose opinions I greatly respect that there has been a falling-off in the quality of the primary-school product of late years, and that the pupils now entering the high schools are inferior to those who came to us, say, ten or fifteen years ago. I do not personally agree with this view, and, though it is only during the last six years that I have had full opportunities of direct contact with such pupils, I am confirmed in the more favourable opinion by the general trend of a discussion on the point at the Secondary Conference of 1908. I think that the comparison is often unconsciously made between the picked pupils of fifteen years ago and the average pupils of to-day, when the doors of the high schools were more widely opened. The fairer comparison is between the general level of the first-year forms (excluding preparatory classes) then and now, and this would, I believe, show an improvement rather than a falling-off. We must also take into account that the emphasis, so to speak, has to a certain extent shifted. Less grammar may be known by the better pupils, for instance (and no doubt with many the grasp of grammatical principles is not what it might be); but there are compensations, and I think that, take it all round, the intelligence has been no less well developed. I am decidedly in favour of a moderate amount of home-work in the higher standards. It should, I think, never exceed an hour per evening, and might be less. But I look on it as a valuable means of developing self-reliance and of ensuring permanent results in a subject like history, for instance. It should also foster the habit of reading. As regards written exercises, I would strongly deprecate the habit of insisting on an artificial, as distinct from a reasonable, standard of neatness, with constant use of the ruler, profusion of red-ink lines, and the like. This is psychologically a mistake. The cost under the head of "Secondary Education" to the State funds has no doubt greatly increased of late years. In 1910 it was £11 0s. 11d. per free pupil. Even adding the proportion of cost derived from endowments, this appears to be only slightly over £13—a sum which is, I believe, well under the cost in England, for instance, and can scarcely be thought excessive. I make no attempt to go into comparative figures, which will no doubt be given by the Inspector-General from much fuller knowledge. I believe that good value is obtained for the money; and I am confident of this: that greater efficiency will hardly be obtained without increased expenditure. The main requirements for such increased efficiency, on a large scale, are, in my opinion, increased staffing and the training of secondary teachers. Both of these imply money. (1.) Staffing: According to the secondary returns for 1910, the average number of pupils per teacher was 20·9. Averages are, however, often misleading, and the lowness of this is probably accounted for by the number of small schools. In the larger schools, like our own, the proportion is much larger. In my own school it is now over 29. The Secondary Conference of 1910 unanimously resolved that it should be at most 25 per assistant; and this is a very moderate standard. Unduly large classes in secondary, as in primary, schools seriously affect the nature of the teaching and the progress of the pupils. With regard to training, I believe the training of secondary-school teachers for secondary teaching would be an immense step in advance, but a special course would certainly be required for their training. The primary

course would, in my opinion, be almost entirely irrelevant. The present primary-school course, as far as I can see, is mainly useful as regards secondary teachers for such matters as discipline and the handling of classes. It gives a man who has been through it some practice in the method of teaching classes; but at the present time I do not hesitate to say that I would just as soon have an able man who has had no training at all, and do my best to train him myself. Of course, one cannot do that in a way in which it would be done by a secondary training college. At present when a man comes you try to show him how to approach a subject, and so on; you listen, as far as time permits, to his lessons; and at times in subjects that you feel at home in you take a lesson in front of him; and you direct his attention to suitable literature. There is now a really good body of literature upon the methods of teaching the different secondary subjects, and a great deal can be done by an able man who will make an earnest attempt to familiarize himself with these. At the same time, it is certainly not true so far as my Board is concerned—I am speaking of the last six or seven years—that training is considered of no value, or that the most brilliant scholar is necessarily appointed. As a matter of fact, I think of the eight assistants who have been appointed since I have been here, three, if not four, have been through the training college, and four at least have had previous experience in primary teaching. But the whole method of teaching in a primary school and in a secondary school is different in many respects, especially if the primary pupil has no home-work, and is what I should call "spoon-fed." There is a tendency to spoon-feed in the secondary school accordingly. It is most important that the pupils in secondary schools should, so to speak, prepare the lessons in most subjects in order that the teacher may work in the main lines, and teachers who come only with experience in primary schools would be liable to err in that respect. I may mention that the best young assistant I have had at the high school during my term was a man—Mr. Adams—who had no previous training at all—he is now a lecturer in the Otago University—but he was a man of high ability, and made a real effort to appreciate one's desires. He also made a considerable study of pedagogic literature at the high school. The suggestion that all secondary-school teachers should have experience in a primary school is, to my mind, absurd. I doubt if one secondary headmaster could be found to affirm that; neither does it coincide with the practice in other countries. In my opinion, the course of training adopted for secondary teachers should be different. Men should have a one-year course after their degree. I believe that is the practice adopted in many centres in the old country. A vocation course for secondary teachers should be of considerable advantage. I understand there are financial difficulties in the way of establishing a course in training colleges for secondary teachers, but something might possibly be done by following out the suggestion made by one witness and attaching senior students to secondary schools for a time for the purpose of observation. In science subjects, at any rate, they could give valuable help. I believe something is being done in this direction in at least one of the large schools of the Dominion. With regard to free places and scholarships, I should certainly like to see an advance in the average length of stay of the free pupils, which with us amounts to something over two years—about two years and one term. I think the figures for the whole of the Dominion are somewhat higher. Taking last year's figures—and they are not very different from the others—I find that 24 per cent. drop out at the end of the first term in my own school. I do not regard that as being a bad figure. There is a certain number of misfits, of course, who drop out at a comparatively early period, and in these cases it is best for all concerned that they should drop out. At the same time, most of the 24 per cent. are certainly boys who might have profited by a further stay. They have probably been taken away in most cases through the attraction of immediate earning and the inducements offered by business men to get them. There is a great demand for young boys in the offices. The figures I have quoted appear to be considerably better than those in the American States. I think the Inspector-General has pointed out that in one big American State the figure is about 48 per cent. In the face of that, and considering, so far as my own school is concerned, there is a slight heightening of the age of leaving, I do not think there is need for any extraordinary step in the matter; neither do I agree with the suggestion that we should bind down parents of pupils who hold free places to keep their boys for two years at the school on penalty of refunding the money. That would be a fairly heavy sum. For two years the fees would be £20, and if a boy left at the end of one year it would mean a refund of £10. In my opinion that would be a serious bar to poor pupils, and it would mean barring out some pupils who would be of considerable value to the school, and who would stay considerably longer than one year. I would sooner trust to the growth of public opinion in the matter. A large proportion of these pupils come from a class which has been accustomed for generations to let boys go to work early. We must not, therefore, be in a hurry. A financial guarantee would tend, so far as I can see, to drive pupils artificially into the technical schools. At the same time I am in favour of exacting such guarantees from the parents of scholarship-holders. I myself proposed that to the Otago Board about four years ago. I pointed out that boys had a scholarship, and held it while merely looking out for an appointment, and then resigned it, thus barring out other promising pupils who would have continued their course. But the Board declared that the suggestion was entirely unpractical. I may say I am strongly against the abolition of scholarships. It is said that in other countries there are no scholarships, and that the giving of free education for two years ought to be enough. But the fact is that it is not enough. The complaint is that a large proportion of promising pupils drop out too early. Surely we should not now, in the face of this, diminish the attractions to them to stay. In the present state of public opinion I believe that scholarships are necessary, and that they return good value to the State by inducing promising boys to continue their education. I doubt whether any secondary teacher of position is in favour of their abolition. Perhaps that is an exaggeration, but the matter was fully discussed by the Secondary Conference in 1910, and the proposal was there made that scholarships should be abolished, and it was defeated by a very large majority. The amount of the junior scholarship, which is £10 in Otago, might possibly be

less—I should prefer to keep it what it is now—and in that case the number of senior scholarships might be increased. I think it would be an excellent thing to increase the number of senior scholarships. As to the proposal to abolish them and increase the number of allowances to country pupils, I think that is very ill advised. As a matter of fact, the holders of the special country scholarships—I mean those coming from the country who do not win one on the general list, but take a scholarship of very much lower value—are, broadly speaking, not a very satisfactory class of pupil, and I do not think special inducement should be offered to them to continue their education in the towns. It is true that the country boy of high ability should be helped to get an advanced education, but it is mistaken kindness, to my mind, to persuade a boy, so to speak, that he had high ability, and simply disappoint him in the end. Further, I believe the abolition of scholarships in favour of an increased number of country allowances would be an injustice to the townspeople. As to the matter of competition which was alluded to, it seems to me madness in a competitive society to get rid of the element of competition—that is, providing it is kept within due measure. It may be that there is some undue competition, but I cannot speak as to that. I can only say that I think public opinion should be sufficient to repress that. With regard to the senior scholarships, for which we almost exclusively prepare, certainly neither we nor, I suppose, any other reputable secondary school give the boys any additional work to the ordinary school subjects and ordinary school course. It is utterly absurd to say that there is anything like cramming or undue competition for the scholarships; and, as for the few pupils who try for the Junior Scholarships from the high school, they are really at a disadvantage as compared with the primary-school pupils, because they have to follow our ordinary secondary course, and are given no special help whatever. The question of overlapping is a difficult subject to deal with. So far as I can see, there is no overlapping in the strict sense between the high schools and the technical schools. We both offer a course preparatory to commerce, but there are important differences between them, so far as I have knowledge of the facts.

2. What are these differences?—There is only overlapping in the sense that both the secondary and technical schools provide a commercial option. The main point, so far as I can gather, is that those who take the commercial course at the technical school certainly take no foreign language, and they take no mathematics except commercial arithmetic.

3. Is no French taken by the technical school?—Not in the day-classes. In most respects our commercial boys have to follow the ordinary school curriculum. They merely substitute for Latin or French a commercial course, embracing book-keeping and commercial correspondence and commercial geography and shorthand. It is true there are none of the fundamentals in this course, and it might have been desirable, had there been sufficient funds available, and had circumstances otherwise permitted, to provide for the option given at the technical school in connection with the high school; but under present circumstances I believe that the course taken at the technical school is educationally inferior to ours. At the present time a parent choosing for his boy is guided largely by the general efficiency and prestige of the school. When a boy goes to the high school he has the choice between certain options. There options are more or less on an equality; but supposing you had side by side with them one which was distinctly inferior educationally and also offered a bribe, so to speak, in the way of immediate payability, there would have been a serious danger of a large number of pupils being attracted to what I should regard as an inferior course. I do not say that such a course would necessarily be inferior in essence. I do not by any means think that Latin, for instance, is absolutely necessary for a sound education. I believe that an equally good course may be given, ultimately, at any rate, without the inclusion of a foreign language, but at the present time I do not believe it would be so good. I think it is not an exaggeration to say that the teaching of English is more or less in an experimental stage in education generally. No doubt picked teachers are able to teach it with equal benefit to a foreign language, but I do not believe that is true, generally speaking; and if it is not true in England it is certainly less true in New Zealand. What I believe is that Latin or some foreign language is at present a necessity. I am aware that there are educational experts of name who think differently, but I have on my side the opinion of the majority of educational experts, and the authorities in England, Germany, and, I would say, the United States. In England the Board of Education requires that special proof must be given that the exclusion of Latin is for the benefit of the school; and Professor Sadler, in a valuable paper based upon the present state of secondary education, seems to hold the same general position I have indicated. In Germany also by far the larger proportion of the pupils in the secondary schools are still taking a mainly classical course, and a classical course in the sense in which it is not taken in New Zealand at all—namely, Latin and Greek. I think that is sufficient evidence to convince us we should go cautiously in these matters. I believe that experiments should be made along the lines of a non-linguistic education with practical elements included, and had we had the money to do it I should have been prepared to advise my Board to do it; but when my own and I presume other Boards have been lacking funds for the necessities of the present types of education, they would hardly think it wise to launch out in experiments. That brings me to the matter of Boards. I am against the amalgamation of secondary, technical, and primary education under one authority. I will say that I am convinced from personal knowledge that the majority of the secondary teachers are strongly against that, and I would urge that before any such important step is taken the matter should be referred to the Standing Committee of the Secondary Conference for an expression of opinion. The saving as regards money, I believe is mainly illusory. The expenses of management are, as a rule, low. As regards my own Board, I have reason to think that little or no saving would be effected if it was abolished as a secondary body, and I am confident that it would constitute a danger to secondary education. More especially would that be the case if larger Boards covering larger areas were adopted. In any case, it would certainly mean, in my judgment, that each Board should have a Director of

Education who should be equally competent to deal with secondary and primary education; and where are these Directors of Education to be found? I am confident they are not to be found in this Dominion, because the circumstances do not allow of it. I think that the administration of the High School Boards has been, on the whole, well conducted. I do not believe that it would be better conducted under Education Boards. It is of decided value that men should be continuously associated with the high school, and feel, as it were, some propriety interest in it. In the Old Country, where secondary schools already have governing bodies, the governing bodies still exist under the present system, even if they do receive grants from the Department, and circumstances in the Old Country are different. The work of education both in counties and boroughs is conducted by strong Committees, on which the larger proportion consists of co-opted experts; and, so far as my own locality in the Old Country is concerned, I say that these co-opted experts in many respects run the Committees. I do not believe that in our circumstances in New Zealand we shall be able to secure such experts. I do not say that the position of the present High School Boards is perfect—in fact, I think that alterations might be made in some respects. I think that in University towns that University professors should be represented on the High School Board. It would be of advantage, too, where the Mayor is *ex officio* a governor that the City Council should rather nominate an individual as governor for a term of years. Valuable service has been done within my experience by the Mayor as an *ex-officio* member; but still more valuable service would be done, I am certain, if the appointee of the City Council were on the Board for a term like the rest of the Board. With regard to an Educational Council, I am strongly of opinion there should be an Education Council or consultative Committee. I think such a Committee should consist entirely of experts representing the different branches of education. Meantime I think more might be done than has been done. I will take secondary education, for instance. I think that before regulations seriously affecting the work of secondary schools are issued the Standing Committee of the Secondary Conference should be officially consulted. I am not finding fault with what has been done by the Department; I believe its administration has been good. Before the important change of introducing free places on so large a scale was adopted, I believe it would have been to the interests of education to have had some gathering of the headmasters and those concerned in order to discuss and advise upon such points. I am no opponent of the free-place system, but I think it could have been brought about in such a way as would have minimized the split which has to a certain extent taken place amongst certain classes owing to the introduction of that system. Then, I am of the opinion that there is urgent need for expediting the progress of the quicker pupils in the primary schools so that they may reach the final standard a year earlier than they do, and take up secondary work at a somewhat earlier age. I believe that, broadly speaking, the quicker pupils in our schools are at least a year behind the pupils in English secondary schools. I judge not only from the experience I have had of the British system, but also from the programmes of work set forth by the educational authorities at Home; and it seems to me that their pupils are doing at an average age of twelve very much the same work as we are doing at fourteen. The quicker pupils do not come to us earlier than that. I am glad to say, however, that within the last year or so there has been a decided improvement in that respect, as there was a number of pupils coming to us this year and last year under fourteen years of age. I believe, taking all things into consideration, we are a year behind the English secondary schools. I do not blame the primary teachers for that. I think they do really as much as can be expected under the present circumstances; but I do think a real effort should be made to improve matters, as a year's loss in the school life of a child is very regrettable, and you cannot make up for it. They will leave school at much the same age in any case; and it is highly desirable that you should get them further on. The British secondary regulations mention twelve as a desirable age for the primary pupils to pass into the secondary schools, and I thoroughly concur in that. No doubt that mainly means better staffing in the primary schools. I see some suggestion has been made in the North to gather together the Fifth and Sixth Standards in central schools, but I know there are strong arguments against that, and with better staffing that would probably be unnecessary. There could be (*a*) and (*b*) classes established, and I am confident it would be found the (*a*) class would cover in two years at least as much as can be covered in three years under present conditions, and without overstraining any of the pupils. At present the boys of a class have to be measured largely by the average, and if you can segregate the better half of the pupils it stands to reason you can do much more with them. The better half of the pupils who come to us seem to have been not at all extended during the last year or so, and I believe the primary teachers are fully conscious of that. The same difficulty has been found in America, and I see that some years ago the English experts on the Moseley Commission, while recommending many things in the American schools, reported that the average American secondary pupil was from a year to two years behind the average British secondary pupil, and I have seen even stronger statements made by leading American experts. With regard to training colleges, I should like to express my own sense of the importance of steeping the students at the training colleges in the best English literature. I agree with the evidence of Mr. Goyen—that it is of the utmost importance that our teachers should be men and women who themselves have a good knowledge, and real interest and love for English literature. I should also like to see a stronger effort made to improve the current pronunciation of the schools—a thing which I think could best be done through the training colleges. I do not refer to elocution work, which, of course, is a good thing. I am speaking of pronunciation, which I think could be greatly improved if a move were made to take up phonetics as a necessary part of the curriculum of the training colleges. I believe that has been done in Scotland and in many of the English training colleges, and it is favoured by such authorities as Professor Wylde. I have seen it stated on good authority that a notable improvement has been made in many of the London schools in this respect.

The teachers receive a thorough training in phonetics. They develop the habit of attending to their own pronunciation and of noting how it differs from that of others, and they have some notion of how to remedy the mistakes of the students. I believe good pronunciation is of more importance than would appear at first sight. It is of importance to an appreciation of English literature, particularly poetry. Then, I believe that special lectures in psychology as applied to education should be given in the training colleges. I do not think that is done at the present time. It appears to me that a man who merely takes psychology for the degree does not sufficiently bring his acquirements in the pure science into relation with education. I should like to see a special course in psychology having special reference to its application in teaching. A further suggestion I would make is that all private schools within the Dominion should be subject to Government inspection to this extent: not that the Inspector should have power to examine, but that no school should be permitted to be conducted without a certificate from an appointed Inspector that it reaches a minimum standard of general efficiency, and that structural arrangements, and so forth, are suitable.

4. That is to say, before a license to teach should issue to those private institutions it should be inspected by an officer from the Central Department, or from such locally constituted body as has charge of educational matters?—I think myself the Inspector should be one from the Central Department unless those in charge of the private schools were willing that their institutions should be inspected by local officers, otherwise it might be said they were being inspected by those who represented their natural rivals. I believe such authorization is required for private schools in Germany, and that some steps have been taken in this direction in England also. I think it is as well that the public should have some guarantee in this matter. I myself am strongly opposed to anything like the inclusion of sexual physiology in the curriculum of the schools. I am by no means a believer in what may be called a conspiracy of silence. The position of day schools and boarding-schools in this matter is very different. In a day school I believe the responsibility should rest with the parents, together with the minister of religion; and in special or difficult cases the parent, in my opinion, would do well to call in a good doctor, and get him to talk to the boy. Some parents, to my knowledge, do that. I certainly do not believe in lectures being given to the classes by outside experts. Such experts, like aliens, are liable to take a distinctly morbid view of the subject, and while I do not doubt that to some they do good, I am persuaded that such lectures delivered to numbers in other cases do distinct harm. I know that opinion is supported by others who are entitled to speak with authority. Dr. Clouston, in his "Hygiene of Man," I think, speaks much to the same effect. Personally, I should place more trust in a word in private and in the fostering of healthy interests, athletic and otherwise, at the dangerous age, and in the handing by the parent to his children of suitably chosen literature upon the subject. Any discussion on such matter should, I think, be personal, and not wholesale. I entirely agree with the memorandum on the subject which I believe has been handed in to the Commission by Mr. Tibbs, of Auckland.

5. *Mr. Davidson.*] In connection with the question of pronunciation, do you think it would be a good plan if exercises in voice-production were given for a few minutes daily in both primary and secondary schools by teachers who had themselves taken lessons in the subject?—I was not speaking of voice-production, but rather of phonetics or pronunciation—a proper discrimination between the different sounds. For instance, when a child says "lidy" instead of "lady," and so on, he should be taught the correct pronunciation. The teacher should know precisely what are the sounds involved and what are the natural tendencies to degradation in order to cope with that trouble properly.

6. Then, you recommend that this subject should be thoroughly taught in connection with the training of teachers?—Yes, I believe it is a compulsory subject in Scotland now.

7. You referred to the unnecessary retardation of the cleverest of the pupils in the primary schools: have you such knowledge of the primary schools as a parent as well as a principal of the high school?—I have, but I am not referring to my own children.

8. Do you think the method of promoting from classes yearly has something to do with the retardation of the cleverest of our pupils?—I think that probably is the cause.

9. If the method of promotion were altered so that the work could be divided into two periods, and the larger classes were divided, as I think you suggested, into, say, (*a*) and (*b*) or junior and senior, and promotions were made half-yearly, do you think the evil might be eradicated in that way?—Speaking as one from outside, of course, it seems to me that would be a very good plan.

10. Do you know that such a plan is being tried in some of the most progressive States of America?—I was not aware of that, but something of the kind was done here at the time of the change of date of examination.

11. You disapprove of one body having control over primary, secondary, and technical education within one district?—Yes.

12. Do you think if such a reform were brought about the position of a member of such a body would be of greater importance, and you might get a better class of men or women to seek such positions?—I think you get a fairly satisfactory class at present. It is not for me to judge the *personnel* of Education Boards. I think you would get much the same class. In England, it appears to me, the best work on Education Committees is done partly by teachers in other grades, partly by retired teachers, but largely also by men and women of independent means who have themselves had a high education, and have devoted themselves to that work in life. That was the case in my own neighbourhood in England.

13. If the method of co-option I have referred to were adopted here, could you not have equally strong Committees controlling the several branches? You have now, and you will in the future to a greater extent have, men and women who have had considerable experience—who have retired at a comparatively early age upon superannuation?—No doubt such people might be

obtained as co-optative members; at the same time, I think it would be still better if they were on the present governing bodies.

14. On the question of scholarships, would you be in favour of giving a book allowance of, say, a maximum of £5 to scholarship-holders from towns in lieu of the present £10?—I should prefer to keep to the present figure, because I believe the scholarship allowance does exercise weight with a great number of the parents. In any case, if that were abolished, there should certainly be an allowance for books and other incidental expenses connected with secondary schools, such as subscriptions and the like. It is a great pity that boys should be hampered in that way.

15. Do you regard a free place as being practically a scholarship?—No: it is, so to speak, a public service. In my opinion, it is to the advantage of the State to provide free secondary education to all capable of it. I think, however, something is required to counteract the strong inducements that are offered by business men to sharp boys to leave school. I often wonder at the way in which the poorer parents now keep their boys at school in spite of the constant demand for boys by business men.

16. Speaking of the training of teachers, I think you said you would prefer to have an able man straight from the University than one who had had training at the training college?—I say that in a secondary-school teacher I should attach more importance to knowledge as such than to previous training in teaching. The possession of a degree, although not an absolute requisite, is certainly a very desirable thing as a proof of tested attainments.

17. Given equal attainments, you would prefer the trained man yourself?—Certainly. If I had to discriminate I should, of course, also be guided to a great extent by personality.

18. *Mr. Thomson.*] It is not a fact that some persons may hold high academic qualifications and yet be poor teachers?—Yes; I have repeatedly passed over men with high degrees.

19. You said you would attach more weight to knowledge when employing a secondary-school teacher: would you not attach more weight to personality?—I must have expressed myself badly.

20. Do you not think our systems should be so co-ordinated as to permit of primary-school teachers, if they take their university degrees, passing from the primary to the secondary schools? Do you not think we ought to encourage that, and that it would be advantageous to the whole of our education system?—I do not think it would be a bit more advantageous than getting a good man without previous training for secondary work.

21. You seem to deprecate the fact that teachers should be trained in any primary work for secondary schools?—I do not say that.

22. Can you show any points of differentiation between the methods employed in the primary and in the secondary schools?—For one thing, dealing with subjects in the secondary stage requires greater knowledge. For another thing, there must be less spoon-feeding, so to speak. The boys are expected to take a greater part in the lessons themselves. They prepare the work in such ways that the teacher can go over it—work out the main lines—the relations of cause and effect, and the like.

23. Does the fact of a man being a primary-school teacher handicap him for undertaking secondary-school work?—Certainly not; but experience in primary teaching for a master going to a secondary school is only of subsidiary value.

24. Is there a scarcity of secondary-school teachers, do you know?—I would not say that.

25. Is it not a fact that in the secondary schools the dull boys are neglected, whilst all the efforts are concentrated to the bright boys?—I do not think any one would say that about my school. I personally, and I believe my teachers as well, pay as much attention to the dullest boy in the school as to the cleverest. That is a principle I have always adopted, and one I hope to keep up.

26. Have you any system of classification of the boys?—A very careful system.

27. With regard to sexual physiology, have you had lecturers from the White Cross League lecturing at your school?—No. I found myself unable to give facilities for the purpose at the high school. I am confirmed in my attitude by the independent judgment of other experienced headmasters, including one who had had such a lecture in his school. He said he would never have such a lecture given again.

28. *Mr. Kirk.*] Do you teach typewriting in your school?—No; we teach shorthand as one of the ingredients of the non-Latin course. Typewriting is more a matter of manual dexterity, and should not, I think, form a part of any course professing to give general education.

29. Is not shorthand very much the same?—No; I think shorthand has some opening effect upon the mind. It gives some grasp of phonetics, and so on. It gives the boys who take it some independent point of view. I believe it is in some degree educative, and stimulating to many boys. It is inferior in educative value, of course, to many other subjects.

30. Do you think the teaching of shorthand has any effect upon the spelling of the pupils, either for good or evil?—I do not think it has, but I believe myself we ought to take some steps towards the improvement of our spelling.

31. Do you think it is advisable to spend the time of the school in teaching it?—I think for boys to wish to take a commercial course it is quite a defensible ingredient of the school course.

32. Have you any means of judging how many of those boys who take a commercial course actually go in for commerce?—Many of them do.

33. Do you think boys at that age are capable of choosing their vocation in life?—Perhaps not; but when boys enter my school I do my best to set before the parents clearly the various options, and explain the effect of them, and they, speaking generally, go carefully into the matter, and decide to the best of their ability according to what is likely to be the vocation of the boy. Most parents appear to welcome it, but I have heard some men say they would prefer their boys not to learn it, because they would always be kept at it.

34. Do you know how many boys after they leave school stick to their shorthand?—I should think a considerable number do so. I think it is a valuable thing for any one to have. I should like to have it myself.

35. Is shorthand a subject which if neglected for six months after school life is left can be at once taken up again?—I suppose further practice would be required.

36. Do you think there is sufficient time to spare in school hours to devote to that subject?—Yes, I think we can spare the time.

37. Have you any recommendations to make as to the teaching of arithmetic? For instance, do you know the system that is taught in the Horace Mann Secondary School in New York, in connection with which there is the reproduction of actual business operations?—I have read accounts of that school with interest, but I am not able to speak about it.

38. From your own personal observation, have you any recommendations to make as to the manner in which improvement can be effected in the teaching of arithmetic?—I believe, generally speaking, arithmetic is well taught in the schools.

39. Do you think it is sufficiently satisfactory for the commercial course at the present time?—Well, you do not expect a boy after two years at school to leave initiated into all the specialist work of business offices.

40. In your opinion, should a boy be able to add accurately?—Certainly.

41. Is he doing that at the present time?—I should say, speaking generally, he ought to be able to do so.

42. Have you had any outside opinions upon the subject?—I have seen expressions of opinion by business men to the effect that the arithmetic was not generally as good as it was some time ago. Probably in the old days more attention was given to arithmetic; but you would expect if more attention were given to arithmetic for business purposes the boys would be more proficient in mercantile operations.

43. Are not mercantile operations in connection with arithmetic very essential?—Certainly.

44. Ought they not to be more systematically developed than they are?—I should say, generally speaking, the pupils are sufficiently advanced in simple mercantile operations, to which I think you allude.

45. You spoke of the children of our schools being in your opinion a year or two behind those of the British schools: do you know at what age children enter the primary school, generally speaking, in that country?—I should say, at the age of about five or so.

46. At what age do they generally enter school here?—Much about the same age, I think, though I cannot say I have any direct knowledge.

47. At what age, in your opinion, should children commence their primary education?—I should say, six ought to be early enough.

48. What physical training do the boys at your school have?—In addition to the military training and the ordinary school games they have an hour's gymnastics per week, as an ingredient of the regular school course; and, apart from that, I have recently instituted the practice of giving the boys a quarter of an hour's physical drill every morning before school.

49. Do you differentiate between the strong and the weakly pupils?—Yes; the instructor makes careful provision for those boys in any respect weakly, and gives only such exercises as are adapted to them. Parents have spoken in appreciation of that.

50. Are any records kept of the boys and their development?—No; I should like to keep them, but there are many things I should like to do if time and considerations of expense permitted.

51. You agree that it would be a wise thing to have it done?—Certainly; and in the absence of such lectures as were mentioned a short time ago, it might do a lot towards the desired end.

52. Do you also take swimming?—Yes, I forgot to mention that. Every boy who comes to the school is expected to learn swimming, unless he is specially exempted on medical grounds. According to a calculation I made a short time ago 90 per cent. of the boys who had been with us for a year had made at any rate some progress in swimming.

53. Mr. Milner emphasized very much the teaching of history and civics in the schools, and regretted the fact that the teaching, in his opinion, was not satisfactory at the present time?—Yes, I agree with him. I myself see that every boy in the school learns something of the history of the Empire, at any rate. He goes through it in outline, and if he remains long enough he goes through a portion of it in detail. I brought this matter up before the Secondary School Conference—that the teaching of history should be encouraged in the Diminion; and it was on that recommendation that it was brought before the University Senate, I think.

54. *Mr. Wells.*] Do you get many of the free-place pupils who in your opinion would have done better work at the technical school?—Not any large proportion. Until the present year I have divided my new entrants every year into three classes, (*a*), (*b*), and (*c*). After careful examination in English and arithmetic, my own opinion—and it is confirmed by conversation with those assistants who come most closely in touch with the boys—is that the (*a*) boys particularly have been most satisfactory, (*b*) quite satisfactory, and a fair proportion of the (*c*) boys have also been satisfactory, the (*c*) class including many of those who come within the proficiency certificates. I believe the wastage, so to speak, is very small, and not larger than it would be and must be under any system.

55. Do you think there would be any improvement if there were consultation between the parents and the teachers of the primary school before the boy decided where he would go for his free place?—I should say in the majority of cases that did occur. Our local parents seem to take a very real interest in the education of their children. They come and see me about it, and talk the matter over.

56. Would you advocate the establishment of a training college for secondary-school teachers?—Ideally that would be the best course. The best work done in connection with secondary training that I know of is the Oxford University course in education, which has been already mentioned.

57. One such institution should be ample for the Dominion?—I should think so.

58. Would you approve of a Dominion scale of salaries for high schools?—I see no reason to disapprove of it; but you would have some difficulty in regard to boarding-schools. I think

boarding arrangements should be in the nature of hostels. The Boards should make such payment as was thought fit to the headmaster, or whoever was in charge, and the other profits should go to the general funds of the school. The system which prevails in many of the older schools in England is considered undesirable by leaders of educational opinion there. By far the most profitable thing in connection with education is the holding of boardinghouses, which has nothing really to do with education.

59. Is there any boarding establishment in connection with the school here?—We have a boardinghouse.

60. Does it take all the children who come from the country?—We have not a very large number of country children in the school. Some time ago when I looked into it the total number of boys from the country, including railway boys, was about thirty-eight. About twenty-three of those were resident at the boardinghouse, and the remainder resided with relatives.

61. Is the boardinghouse under the supervision of a teacher?—It is under the supervision of a senior master.

62. Speaking of sexual physiology, you were of the opinion that the instruction should be given either by the parents or by a minister of religion. You realize, I suppose, there is an innate diffidence on the part of the majority of parents to mention that subject to their children?—That is so. The same diffidence would exist with the teacher. It should not be done by any one who does not stand *in loco parentis* to the boy.

63. You think there should be individual instruction?—What I recommend is that a parent should get some judicious medical man to speak to his boy, or more generally perhaps that he should choose some literature on the subject, and hand that to the boy, expressing his willingness to talk over any matter that the boy may feel a difficulty about. I am convinced that that is the best method of dealing with the matter. This bringing in of experts from outside should be deprecated.

64. Recognizing that the majority of parents will not do this, would you let it go?—It is a difficult question. I would let it go sooner than adopt the alternative which has been suggested. As a matter of fact, I do not think boys are altogether neglected in the matter. Sunday-school teachers and others exercise a good deal of influence in that direction. In the Church of England the ministers exercise an influence in the preparation for confirmation, and no doubt similar methods are adopted in other denominations. I think there is great danger in dealing with the matter by public or semi-public lectures, and my opinion is confirmed by the opinion of others.

65. You mention the inspection of private schools: you think it is right that all schools should be subject to examination: do you think that mere inspection is sufficient? Should not the Inspector have power to test if he thinks it is necessary?—That could wait until public opinion was prepared for it. My opinion is that a competent Inspector—and, no doubt, they are competent—could go into a class, and after quarter of an hour, have a good notion in outline of the educational efficiency of that class. In practice that is what the headmaster has to do.

66. That is quite sufficient at the present time?—Yes, and all that the present state of public opinion would allow.

67. *Mr. Hogben.*] Did I understand you to recommend that there should be one separate training school for New Zealand for the preparation of secondary-school teachers?—I think it would be a good thing, and we could bring in where necessary experts from outside to begin with. There has been a considerable movement of recent years in secondary education. We are largely cut off from the influence of that, owing to the lack of such specialist associations as the English Association, and the Classical Association, Geographical Associations, and so on, and I think it would be necessary in starting it that we should in some subjects, at any rate, bring in trained teachers.

68. Do you think it is necessary that it should be separate from one of the present training colleges?—I should be inclined myself to think it would be best to have a secondary training college. If considerations of expense forbade that, it might be possible to attach it to one of the present colleges, but I do not see how it would be practicable to attach it to one in each centre without involving greater expense.

69. Do you know that in New York they have the same teachers in the colleges for secondary and primary training colleges?—That is quite possible. I am merely speaking with regard to our present set of circumstances.

70. Do you not think that the course of psychology and applied education should include the study of the nature of a child from a very early age?—Yes.

71. Do you not think they could get that by observing the classes in the primary schools attached to the normal school of the training college?—That is rather an indirect way of getting it.

72. Is it not direct knowledge of the child?—It is in one sense; but the average student, I take it, would derive considerable benefit from special lectures on the subject.

73. But do you not think that really first-hand observation is very desirable in connection with psychology?—Yes, but at the same time I should not think it is necessary to give them a lot of practice at an early age. That appears not to be done in Germany.

74. I am speaking of observation. Whatever observation is necessary, if that is provided already, is it necessary to make a special institution for training secondary-school teachers?—I should think so. It would be highly desirable, because if only one you would have a large number of teachers. You would have all the main secondary subjects dealt with by a set of trained and qualified teachers.

75. Do you think if, in our present circumstances, we could not afford what you want, we could select good teachers in the neighbouring secondary schools for observation?—I think something might be done in that way with senior students. I should say that after the degree is taken the student should take a special course for a certain time.

76. You are aware that one who has taken his degree can go to a training college for a year?—I did hear something to that effect, but do they do it?

77. *Mr. Thomson.*] Have you an agricultural course in your school?—No.

78. Do you not think it wise, seeing that the trend of population is from the country to the town, that there should be an agricultural course?—I would like a lot of things if I had the money. Some of them I want before an agricultural course.

79. You are aware of the high position which the Waitaki Boys' High School holds?—I do not know that our own school bears an inferior reputation to Waitaki.

80. You are aware that Waitaki High School has that reputation, and that children come to it from all parts of New Zealand, and even from Australia?—Yes, as a select boardinghouse.

81. How many matriculated from your school last year?—The year before, twenty-eight, I think. Last year there were considerably more.

82. Seeing that we are an agricultural country, would it not be wise to introduce an agricultural course?—If we had all the other courses which I regard as pre-requisites, sufficiently equipped and developed, I would be ready to consider it. I should, however, think there would be small demand for it in the towns.

83. If there was a strong bias created for agricultural training in the primary schools in the country, it would create a demand for it in the towns?—I do not think so. Our pupils are mainly from the towns.

84. *The Chairman.*] Assuming that the rural course in the country leads to a higher-graded school or secondary school for agricultural teaching, is there not a trend from the primary school to that school?—Yes.

85. And therefore Waitaki serves in the particular direction as meeting the requirements of Otago as a whole?—Yes.

86. Your school devotes itself to the preparation of students for professional and commercial courses?—Yes.

87. And the results of the Matriculation and Scholarship Examinations in the past have proved that your school is fulfilling its proper function in those directions?—I believe so.

88. Do you not think it is only right and fair that the parents of the children attending the high schools should have a voice in the election of the Boards of Governors?—They might possibly have a voice in it, but I do not take it that that necessarily implies an amalgamation of all the schools under a single Board.

89. Is it a fact that the parents have no voice at all under existing conditions?—Not that I know of, except in an indirect method. The Education Board is represented, and the City Council is represented on the Board, and those bodies are elected by the people.

90. You do not think it is desirable that the parents should have direct representation on the governing body of the school?—I do not object to it. I do not think there would be much feeling on the part of parents. I think that parents are, broadly speaking, very well satisfied.

91. That is a matter of opinion?—I have never heard a word of discontent since I have been in the school except from one man, and he afterwards apologized to me unasked.

92. You said you thought the parent and the master of the primary school should consult as to what career a boy should take up on leaving school. Do you not think it would be better that the matter should be deferred until the child is leaving your school, and that you, in conjunction with the parent, would be better qualified to determine the child's future career in life?—Yes, I should think so.

93. If a child only takes a two-year course at your school, is that child properly equipped to fight the battle of life?—I think he is not badly equipped, but at the same time he might be better equipped. At the end of two years a boy should be able to pass the Junior Civil Service Examination or Free-place Examination, as the case may be. I do not regard the passing of examinations as in itself an end, but at present it really represents a fairly well-balanced education.

94. Having regard to what the State expects, is it not a fact that too many boys who go to the secondary school actually mark time?—I do not think so.

95. Would you be surprised to learn that is generally the opinion of parents?—I can only speak for my own school.

96. You say it is not the case so far as your school is concerned. You are satisfied that with the course of instruction two years is sufficient to fit a boy for his struggle in after years?—I am fully conscious of deficiencies, but at the same time I do not think they are badly equipped, although, as I say, I think no boy should leave school before he is sixteen at the very earliest, and I always strongly recommend parents to keep their boys at school somewhat longer.

97. Is not the trend of educational thought in the direction of keeping boys at school until they are seventeen or eighteen?—Certainly.

98. Should not New Zealand, if it wants to be in the van of progressive countries, take steps in that direction?—Certainly.

SAMUEL MORGAN PARK examined on oath. (No. 43.)

1. *The Chairman.*] You are Secretary of the Otago Education Board?—Yes. I have occupied that position for a year and a half, and have been in the service of the Board for thirty-five years. I should first of all like to say a few words regarding the returns which the Department requires from the Board's officers and teachers. The number of returns required from teachers and Boards is, I think, excessive, and the nature of many is more complex than is necessary either for statistical purposes or as a means of checking accuracy. I quite recognize that for the carrying-out of its work a Department so highly organized and comprehensive as is the Education Department requires a considerable number of returns, many of them necessarily of an intricate character. I think, however, that the policy of trusting Education Boards and teachers, which

now exists in connection with some very important sections of the Department's administration, might be extended without any loss in efficiency, thus freeing the Board's officials and teachers from what are at present felt to be very burdensome requirements, and which in the case of the teachers mean the diversion of a large portion of their time from their proper function of teaching. I offer the following suggestions to indicate some of the reforms which might with advantage be introduced: the quarterly return of attendance, two copies of which have to be prepared by the head teacher or sole teacher of every school in the Dominion at the end of each quarter—(1.) That in the first part of the return (lines 1–13) only lines 3, 4, 7, 8, 11, 12, 13 be retained—that is, seven out of the thirteen lines now used. (2.) That the second and third parts of the return (comprising classification of the scholars according to standards, ages, and subjects of instruction) be required for the December quarter only. These two parts of the return are forwarded to the Department for the December quarter only. For the other three quarters they are not used in this office. For these three quarters, therefore, they are quite useless. A moderate estimate of the time necessary for the compilation of the figures in them and the writing out of two fair copies would be an hour. There are about 2,150 schools in the Dominion, so that 6,450 hours of teachers' time are occupied with this absolutely useless work. Reckoning a teacher's whole school time for a year at 1,200 hours, the waste effort represented in this return alone is equal to the whole school time of five and one-third head or sole teachers. The money value of this wasted time is at least £826 (average salary of adult teacher is £155 × $5\frac{1}{3}$ = £826). I do not lay stress on the money value of the time of the five and one-third teachers, as, of course, they would have been employed even though the useless part of the return had not been required; but I do emphasize the undesirability of diverting the teacher's time from his proper work of teaching as exemplified by this return.

Scholarships.—At present Boards have to furnish at the end of each quarter a return showing for each scholarship-holder (there are eighty-five in this district) the name of the holder, the month and the year in which the scholarship commenced, the term of tenure, the amount of each, and how many quarterly payments have already been made. The foregoing information therefore must be supplied four times each year in respect of eighty-five pupils. I suggest that the existing quarterly claim form be abolished, and that in lieu thereof the following be required: (1.) At the beginning of each year a return as follows:—

Number of Scholarships at each Rate of Payment.	Rate per Annum.	Amount per Annum.	Amount per Quarter.
	£	£	£
48	10	480	120
37	40	1,480	370
89	..	£1,960	£490

That is for this district only three lines of figures. (2.) At the beginning of each quarter a return for the preceding quarter in the following form:—

Amount provided by Department.	Amount paid by Board.	Adjustment necessary.	
		Due to Department.	Due to Board.
£490	£475	£15	..

i.e., one line of figures instead of, say, four pages foolscap as at present.

Conveyance of Children.—I take the present method of furnishing claims under this heading to illustrate the reasonableness of extending the policy of trusting the Boards and teachers, to which I have already referred. At present, for the conveyance of every child for whom a capitation grant is asked, the Board has to furnish the Department with a return showing the pupil's name, age, place of residence, names of the three nearest schools, and the distance of each from his home, the name of the school to which he is to be conveyed, a statement of the general necessity for the conveyance, what communication there is by rail or other public conveyance, whether he is to be conveyed by trap, sledge, or boat, what other children there are of school age in the locality, and their number, and what arrangements are made for their education; and, finally, any general remarks. If the Department decides from the information supplied on this form that the pupil is eligible for capitation under the regulations, the application is approved, but in order to obtain payment there must at the end of each quarter be submitted a further return showing the pupil's name, age in years and months, distance of his home from the school by the nearest road (in miles and chains), the method of his conveyance, the number of return trips he has made, the number of half-day attendances he has registered, the date of his admission to the school, or of his leaving the school, and any further information which the teacher may desire to afford the Department. Somewhat similar procedure is necessary, but using different forms, in order to obtain the boarding allowance of 2s. 6d. per week allowed to children who have to live away from home to attend school. The forms containing the detailed information I have specified must be accompanied by a summary of the claims for the whole district, and a certificate from the Board's Secretary that to the best of his knowledge and belief the claim is correct, and that the conditions of the regulations have

been complied with. I submit that all this is futile. The elaborate return sent by the teacher, supported by the Board's summary and certificate, affords no greater guarantee of the correctness of the claim than would an unsupported statement of the Board. For all the Department knows, both statements may be false, and the teacher's signature a bogus one. The Department has simply to rely upon the integrity, alertness, and accuracy of the local authority and its officials and teachers. For all practical purposes, therefore, the returns I have mentioned might be abolished, and the Department might pay the capitation on receipt of a statement by the Board in the following form :—

School.	Number of Pupils conveyed.	Number of Return Trips.	Rate.	Amount claimed.

with the Board's certificate indorsed thereon that the claim is correct according to the regulations.

Manual and Technical.—Of the sixty-eight return forms which Boards and teachers have to use, thirty-two belong to this section. The continuance of special grants for school hand-work classes is, of course, necessary, but I should like to see these made to each district in one sum. Instruction in hand-work has been in operation now for eight or nine years, and, from the information as to present cost readily accessible to the Department, it should not be difficult to estimate what would be a fair grant to make to each district. Hand-work is now one of the subjects of instruction in all schools: Inspectors are quite familiar with it, and teachers are trained in it. There does not, therefore, seem much necessity for forwarding to the Department at the beginning of each year the programme in hand-work to be followed by each school in the Dominion for the year any more than there is to submit to the Department the school programme in English and arithmetic. The remarks I have already made regarding the trusting of the local authorities have special application to this subject. The object of the Department is, of course, to ensure that a sufficient amount of time shall be devoted to the subject, and that the subject shall be efficiently taught; but the forwarding of the school programme in hand-work to the Department gives no guarantee that the work as specified therein will be carried out. For that guarantee reliance must be placed entirely on the Board's Inspectors. I suggest (1) That the forms of application for recognition of school hand-work classes as now required be abolished; (2) that all special registers for hand-work classes in public schools (with the exception of secondary classes in district high schools) be abolished (the saving in stationery alone would be considerable); (3) that annual grants of fixed sums, calculated on a proportional basis, be made to Boards in respect of hand-work instruction up to and including Standard IV (agriculture to be excepted); (4) that for school classes above Standard IV the capitation grant now paid be calculated on the average per standard class, and that the Boards' simple certificate as to the average attendance be accepted. In support of my plea for this extension of the principle of reliance upon Boards to furnish honest and correct returns, I would point out that at the present time the Board's simple certificate per the quarterly attendance returns as to the average attendance for the district is accepted as the basis for payment of sums aggregating £90,000 (for Otago). There should, therefore, be no objection to applying the same principle to payments for scholarships, conveyance of children, manual and technical instruction, &c., aggregating under £5,000. To oppose the reform I suggest would appear to me to be like straining at the gnat and swallowing the camel.

Free School-books.—I am strongly of opinion that the grant for free school-books should be discontinued. That there was no necessity for this concession is, I think, clearly proved by the fact that at least 75 per cent. of the children still provide their own books, and the Board is appealed to by teachers and Committees to provide additional cupboard-accommodation for the free books. The grant should be withdrawn before the people become habituated to it, otherwise they will soon come to accept it as one of their rights, and be inclined to resent its discontinuance. The annual grant at rates for renewal will amount to, say, £7,200, and this sum might well be spent to better advantage.

Election of School Committees.—There is no express provision in the Act for holding an election of less than the whole number required for the Committee except where the number holding office is reduced to less than the number required for a quorum, or where a majority resign (section 123). A case occurred recently in this district where eight members of the School Committee had been properly elected and the ninth member had been illegally declared elected. The Board's solicitors who have advised on this point recommend that subsection (2) of section 118 should be struck out, as it might be held to limit the powers in subsection (1), and express provision should be made for ordering an election of one or more members of a Committee when an election is declared invalid in part, or when a meeting fails to elect a full Committee, and giving power to the Board to make appointments to the vacant positions when they are not filled on the second election.

2. *Mr. Wells.*] What grant do you make to Committees in this district for incidental expenditure?—We have a graduated scale, which at present is under revision. We hope to have a new scale out within a month.

3. Do the Committees supply all stationery free?—No.

4. How is the stationery supplied to the pupils?—By the Committee, or the pupils find their own. In Standards V and VI we have taken advantage of the recent regulation by which we supply a certain portion to the schools.

5. Are any children required to pay for the stationery?—They are not required to pay.

6. Do they pay?—Yes, I understand so. But that is left entirely to the Committees.

7. There is no lump amount given?—No. I have heard no dissatisfaction expressed on the point you mention.

8. With regard to the control of education generally in this district, do you think the Education Board might take over the control of the primary, secondary, and technical schools, giving a fair measure of local control in every case?—I am not prepared to express an opinion on that point.

9. Have you given any thought to a grading scheme for teachers in this district?—No.

10. You have no opinion to offer on the point?—No. My own opinion is that the dual control of School Committees and Board, as we have it at present, is as satisfactory as could be devised. I do not hear much dissatisfaction expressed.

11. Do you disapprove of the issue of free supplementary readers?—No.

12. You spoke of free books generally: do I understand you to mean the books at present issued, or only those books which the pupil may reasonably be allowed to take home or use at home?—I believe the additional reading matter which has been supplied to the lower standards is a very good feature.

13. Do you not think those reading-books have very largely increased the facility in reading?—That is a matter for the Inspectors.

14. Your objection applies mainly to the books the pupils are required to use at home?—That is so.

15. Do you think there is at present much leakage going on in regard to the pupils who leave school after passing the Fifth or Sixth Standard, and do not make any attempt to continue their education?—There is, I think, a great leakage. I think 2 per cent. pass out after passing the Fifth Standard.

16. Would you approve of continuation schools for those?—The objection I have to compelling children to go to continuation schools is that, though you can compel them to go to the school, you cannot make them learn. You have not the same control over a pupil of that age as you have over one who is under fourteen years.

17. Has the Education Board experienced any difficulty in securing the supply of teachers?—Yes, a great difficulty, especially within the last two or three years.

18. That applies more particularly, I suppose, to the small backblock schools?—Yes.

19. You have no difficulty in filling places in the town?—No.

20. Have any steps been taken down this way to grapple with that difficulty?—By the institution of teachers' training classes on Saturdays, and also for special classes in the centres in the country, and also by correspondence classes. Advantage has been taken of the Department's grant in this respect.

21. Do you think that help is given quickly enough in rapidly growing districts?—I think so. The only complaint we have here is in regard to schools of 451 to 500; they think that a teacher should be given earlier than it is.

22. *Mr. Kirk.*] Are your relations with the Central Department at Wellington satisfactory?—Yes.

23. Do you find that the Department administers its affairs, as far as you are concerned, sympathetically?—Yes.

24. You receive a ready response to your appeals?—With due respect to the difficulties under which they themselves must labour. I appreciate the difficulties under which they labour.

25. You are satisfied with the administration so far as it comes under your notice?—Yes, as an Education Board official.

26. *Mr. Poland.*] Do you consider your district too large for proper administration?—I think it is quite large enough.

27. On the other hand, do you recognize that a very small district is not in the best interests of primary education?—I recognize that too.

28. You think there should be a maximum as well as a minimum?—Yes.

29. How do you suggest that the money now spent on free school-books should be spent?—I think the crying need just now is for trained teachers.

30. You would expend this £7,000 a year in that direction?—I merely make that suggestion as a more profitable way of expending it.

31. Do you think that free school-books were never asked for?—There was no general request emphasized in Otago for it.

32. Has there been any friction between School Committees and the Board over the appointment of teachers under the present system?—No, not for years.

33. The Board send forward four names, do they?—Generally. If there are four applicants eligible for the appointment those four names are sent to the Committee, and they have a choice. But in any case where the merits of any one teacher considerably outweigh the merits of the other applicants the Board sends on one name only.

34. Is that system not liable to abuse?—The success of any system depends on the honesty of its administration. So long as this system is administered honestly I consider it a very good system indeed.

35. How do you arrive at the decision that one teacher is pre-eminent over three others?—Almost solely by the advice of the Inspectors.

36. You, of course, are almost entirely guided by the Inspectors in regard to the qualification of teachers?—That is so.

37. Do you not think the Inspectors would be able to say which of the four teachers was actually the most suitable for any position which was vacant?—Generally, yes.

38. Would they not always be able to say so?—No, I think Inspectors, like others, are fallible.

39. You think it is preferable to send on four names, except in exceptional cases?—I believe in maintaining the hearty sympathy and co-operation of Committees.

40. You think it is necessary to send on the four names in order to retain that hearty co-operation and sympathy?—I think so.

41. What about the Committee to whom only one name is sent?—The Board asks that Committee to coincide with its view.

42. *Mr. Davidson.*] Do you think the largely increased cost of administration by Boards is due in a very great measure to the very largely increased amount of work placed upon the Boards?—Undoubtedly.

43. Do you think the numerous complicated returns required has much to do with the increased cost of administration?—It is a very great factor. I know that Education Board officials have to work very much harder now than in former years.

44. *The Chairman.*] At present the Boards have to supply full details regarding the staffs of each school, names of the teachers, classification, rate of salary, &c.: would it not be sufficient if the total amount required to pay salaries in each grade were given to afford a basis on which the Department should pay?—That is a change more radical in its nature than I had in my mind. I do not see any insuperable objection to it.

45. Similarly, in respect to the scholarship returns, would it not be sufficient to give the number of scholarships, the amount paid per quarter, the return to be restricted to three columns?—That is practically what I have suggested.

46. *Mr. Davidson.*] In connection with that return, do you think, if it was bulked together in that way, the Auditor-General would pass the accounts?—That is a question for the Department. So far as the auditing of our accounts here are concerned, it would make no difference at all.

CHARLES REYNOLDS DALTON RICHARDSON examined on oath. (No. 44.)

1. *The Chairman.*] You are the Chief Inspector of Schools under the Otago Education Board?—Yes. I have occupied that position for eighteen months. Prior to that I was an Inspector in the Board's service for fifteen years, and have held positions as a teacher in every branch of the service. I am a B.A. of the University of New Zealand.

2. Will you make a statement to the Commission?—An examination of the statistics showing the expenditure on the various branches of education in New Zealand during the last twelve years shows the following rates of increase in the cost of the several branches: Cost of primary education has increased 75·1 per cent.; secondary education, 238·5 per cent.; University and higher technical, 158·3 per cent.; industrial schools, 180 per cent.; special deaf, blind, defectives, 366·6 per cent.; technical education, tenfold. If the increases are viewed from the cost per head of population we find the rates of increase in each division to be: Primary education cost has increased 30·5 per cent.; secondary education cost has increased 185·7 per cent.; University education cost has increased 75 per cent.; industrial schools cost has increased 100 per cent.; special schools for defectives, &c., 200 per cent.: technical education has been practically wholly developed.

Primary Education.—In the primary department for this increased cost we have among other things: (1.) The average attendance at primary schools has increased 21 per cent., the number of schools by 27 per cent., and the number of adult teachers by 42·4 per cent. (2.) Uniform staffing and salary throughout the Dominion. (3.) Increased staffing and salaries. During the last four years the average salary for adults has been increased by £6 5s. 6d. a head. (4.) A gradual replacing of the pupil-teachers by competent assistants. (5.) Provision for the supply of teachers by means of the probationers. (6.) An increased supply of reading in the additional books obtained under the free-book grant and by means of the *School Journal*. (7.) The machinery for the training of teachers has been doubled by the establishment of training colleges at Wellington and Auckland, and by the better equipment of the Training Colleges at Dunedin and Christchurch, and by the close relation of all these institutions to the University colleges in the four centres. During the past three years the expenditure under this heading has increased 37·6 per cent. (8.) Reasonable grants have been made for the post-collegiate training of teachers in several subjects in which it has been found that further training was necessary. (9.) Provision for the tuition of uncertificated teachers. (10.) Establishment and subsidizing of the Teachers' Superannuation Fund by which aged and less efficient teachers are gradually being replaced by younger and more active ones, and openings for promotion provided. (11.) The finances of the School Committees have been placed on a secure basis and the finances of the Boards are assured. (12.) Greater facilities for conveyance of pupils. (13.) Manual instruction now forming an integral part of the curriculum. From the foregoing it will be seen that the policy of the Department, so far as primary education is concerned, has been a progressive one, and an analysis of these items will show that in the main the administration has been in the direction of increased efficiency in primary work.

Secondary Education.—With regard to secondary education, those more closely in touch with that branch will no doubt supply information as to the departmental policy, but two outstanding features deserve special note. By the introduction of the free-place system and the grants in connection therewith, the finances of the secondary schools have been rendered more stable, while the avenue to a secondary course has been opened to a large number of primary-school children who otherwise could not have availed themselves of the facilities in operation prior to its introduction. This has been a great boon to a large section of the community.

Technical Education.—The increase in the expenditure in technical education has been considerable, but it must be remembered that this branch of education has practically been developed in New Zealand only during the period to which the figures relate, and the inception of any branch must necessarily involve a very heavy initial expense. In this connection a heavy responsibility rests upon the managers and heads of the secondary schools. During recent years ideas of culture and education have undergone considerable change, and the resulting ideals

have revolutionized school methods and subjects. In the past the secondary schools have been concerned with the preparation of pupils for the various learned professions. But other walks of life have assumed proportions of equal importance with these, and society has demanded that courses be provided for giving a basic training for the numerous vocations to which youth aspires. The age is scientific and industrial; and the secondary schools, hedged round with the traditions of the past, have failed to recognize it, or, having recognized it, have declined to modify their curricula so as to meet the demands of the industrial community. Side by side with this change in educational ideas has gone on the gradual decadence of the apprenticeship system; and, in order to provide for the educational needs of the industrial section of the community, the establishment of day technical and continuation schools became a necessity. Much of the expense and overlapping could have been avoided had the secondary-school folks shown adequate foresight and initiative.

Powers of Boards.—So far as the powers of Boards are concerned, there are some directions in which their powers should be increased: They should be given the power to act immediately in cases where, through exceptional circumstances, the working-conditions of a school demand increased teaching-power; their recommendations for new schools should not be traversed by officers not connected with the education service of the Dominion; and they should be given power to arrange for the conveyance of children on the best terms available. The question of securing school-sites is one in which their powers should be materially increased. The placing of probationers might well be left to the discretion of the Boards, who are better acquainted with local requirements than the Department can be.

Rural Courses.—Our experience of the agricultural and rural course is not yet sufficient to enable one to speak authoritatively as to its efficiency; but one point has been forcibly thrust upon me in connection with the scheme. If the scheme is to produce its full effect, the basis of payment will have to be altered, and provision made for the appointment on the staff of each school of a thoroughly qualified teacher in the sciences bearing on agriculture. The work on the science side is too extensive for an itinerant teacher to cope with successfully. The full salary of the science teacher should be paid by the Department, and not as at present, out of capitation. That the course is a good one I am fully convinced, and that the farming community will benefit greatly by it is beyond all doubt. As times goes on it may be found necessary to modify the present syllabus. In all district high schools where this course is taken up an additional assistant should be provided, so that the headmaster might be freed from class teaching, and be able to devote his whole time to direction and supervision of both departments of the school. The salaries of the first secondary assistants should be materially increased, so as to attract to these positions the very best talent obtainable. They should certainly not be less than that of a first assistant in the largest schools. The work of these men is the most arduous in the teaching profession, and calls for a better all-round equipment than any other position except their headmaster's.

Adaption of Syllabus to After Life of Pupils.—In the primary schools we are dealing with children between the ages of five and fourteen, and, if we are to make their school training have a direct bearing on their future careers, we should during these years be able to indicate definitely what their post-school pursuits are to be; but in how few cases can this be done; and if they could be definitely ascertained, what a medley the school curriculum that catered for them would present. The utmost that can be done is to hold the balance evenly between the claims of the cultural, the industrial, and the formal subjects of the curriculum in such a way as to co-ordinate the work of the schools with the social, industrial, and domestic environment in which the child finds or may find himself, and to instil into him the idea that every branch of school-work has some definite relation to himself, his home, or his future—the idea that he is to become one of the world's workers. We should fit him to adapt himself readily to his circumstances by inculcating good working habits, persistent application, and ready initiative, and, provided the subjects are within a child's comprehension, it does not matter much what they are so long as they are presented in an educative way. As two-thirds of the pupils who pass through our primary schools do not proceed to the secondary schools or technical schools, but proceed direct to the industrial ranks, adequate provision should be made for manual training in the primary-school course.

Scholarships and Free Places.—Scholarships should be increased in number, but the number of free places should be materially reduced. Many of the pupils now receiving free places are merely marking time, and the State is not receiving an adequate return for the expenditure incurred on their behalf. In any case, the parent should enter into a bond to the effect that the pupil will remain at school until the expiry of the free-place period, or refund the cost of his education at the secondary or technical institution.

How to secure Increased Efficiency.—With regard to the reference under (11), the first step to be taken to secure higher efficiency must be to remodel the whole system of professional training at the training colleges. At present, in these institutions professional training receives too little attention, and so great a premium is placed on the close connection of the training-college students with the University that the result is considerable neglect by them of the subjects they have to teach in the primary schools. In fact, my firm conviction is that the focus of any inefficiency existing in the primary system is to be found in the training colleges. From the departmental report on the training of teachers for 1910 it will be found that of the 170 students who completed their two years' training college course in 1910 only thirty-six had, during that period, received training in reading, only eighteen had received training in writing, only forty-four had received training in geography, only twenty-nine had received training in nature-study, and only two had received any training in history or civics at either training college or University. Put in another way—Two colleges gave training in reading, two did not; one college gave some

training in writing, three gave none; three gave no training in nature-study, but one of these had a large number of students taking two natural sciences at the University; two neglected geography, and all neglected history. Now, if you consult the reports of Inspectors throughout the Dominion, you will find that for years they have reported the comparatively weak subjects of the primary schools to be reading, writing, geography, history, nature-study, and English—the very subjects which I have shown to be receiving inadequate attention in the training colleges. Reference to the same departmental report (1910) shows that the majority of the students are devoting their time to two, three, and in some cases four subjects at the University, and that to the neglect of subjects they will have to teach in the primary schools, for from the same document we find that the subjects taken by training-college students at the University are Latin, education, mathematics, English, mental science, or modern languages; while in only one college does natural science figure largely. This close connection with the University is detrimental to primary-school efficiency in three ways—(*a.*) It minimizes the importance of the essential subjects of the school curriculum, and sends out students ill prepared to teach them; for it must be remembered that many of the students will have received no instruction in several of these subjects for upwards of three years—since they left the Sixth Standard of the primary school. (*b.*) At the University the teaching methods are quite antagonistic to those that should be adopted in teaching in primary schools, and react detrimentally on the methods that should be, and are, set before students in the training colleges. (*c.*) The facilities for University courses are being taken advantage of by students to prepare themselves for other professions, and afford too ready a means of egress from teaching. Under the bond entered into by training-college students at present, they cannot be called upon to enter the schools as teachers for three years after the completion of their training-college course, and in that interval many enter into other professions. The bond should be immediately operative. In any system of training teachers the needs of the secondary, technical, and rural high schools must be provided for, and provision must be made for some University work; but that could be done by a liberal system of bursaries for, say, 20 per cent. of the best students after they had devoted their whole time for two years to the work of the training college. To each training college should be appointed an expert in English, one in history and geography, and one in science and nature-study, whose work should be to train students both how to study and how to teach these important branches. Every student should be trained how to study and how to deal with literature from a child's point of view, and also how to write with both pen and chalk; and there should be no exemption from these branches during the training-college course. Until we recognize that the majority of the students enter the training college with very poor equipment in even the elementary branches, and compel them to devote more time to perfect themselves in them, we shall not find the work of our primary schools so efficient as it should be. After this course, students who are not sent on to the University should be compelled to take (for one year, at a salary of not less than £90) appointments in such schools as the Board of the district from which they come may direct. I am entirely opposed to the issue of teachers' certificates on the recommendation of the Principals of training colleges, for the following reasons: (1.) No certificate issued by the Department should be such as to cast a stigma, implied or real, on the certificates formerly issued. This the trained teachers' certificates now being issued to students undoubtedly does. (2.) There is no guarantee that the certificates so issued have been won by equality of work. Each Principal may set his own standard of value, and recommend accordingly. Thus you have four standards. (3.) The standard of University work accepted is altogether too low and too variable. The standard of term examinations varies in every University college and with every lecturer. (4.) I am of opinion that only one certificate of competency for teachers should be issued, and that on the results of a rigid examination in essential subjects reasonably defined.

Scarcity of Teachers.—In view of the scarcity of teachers it is imperative that the Department should take immediate steps to increase the supply. It has been suggested that they should be imported, but we do not want the rejects of Britain. If teachers are to be imported they should be selected by two men sent from New Zealand—one from the Native Schools Department, who would pay special attention to the needs of that section; and one from those public-school Inspectors who have a full acquaintance with the requirements of the primary, district high schools, and manual branches of work. In fact, the needs of New Zealand should be advertised in Britain by men specially sent for that purpose. If this is done, some attention will have to be given to reciprocity in connection with superannuation. Another practical way out of the difficulty is to establish at least two auxiliary training institutions for, say, three years. At present the training colleges cannot accommodate all the raw material offering, and if such institutions as I refer to were set up, much promising material would soon be ready for the schools. The course in these institutions need be for only one year, and the aim should be the D certificate. The cost of the institutions could be met by the money now spent on free books, and there need be no outlay for permanent buildings. Another way is to make the service more attractive by increasing salaries, and by placing the salaries of teachers on a more stable basis than that on which they now rest. A large part of the unrest and dissatisfaction existing among teachers to-day is directly traceable to this inequitable and unstable basis of payment, for any teacher may find that after twenty years or thirty years of faithful service his income is reduced through circumstances for which he is not responsible, and on his retirement find his superannuation allowance materially reduced. To my mind, the problem of placing salaries on a stable basis is the most vital one for the service at the present time. Closely connected with this question of salaries is the Superannuation Fund. The Act controlling this fund should be amended in several respects: (1.) Provision should be made for the admission of those who are excluded by the amending Act of 1908. This matter has been favourably reported on twice by the Education Committee of the House of Representatives. (2.) The retiring allowance should be computed

on the three highest years of salary and the consequential financial adjustments provided for. (3.) Consideration should be given to early annuitants. (4.) Some effort should be made to secure reciprocity in superannuation throughout the Empire. In regard to the staffing of schools, I consider that our large schools are most inadequately staffed, and in connection with that I should like to draw your attention to the staffing of the Normal School, and compare the treatment that we can give our infant department there with the treatment that can be given to an exactly similar school in other parts of the province, and show you how inadequate, if the Normal School staffing is adequate, must be the staffing of the other schools. In the Normal School we have an infant department with an average attendance of 155 pupils, and there they have the services of four trained teachers, two of whom are there for all the time, and two for a considerable part of the time. One of them does kindergarten work. Now, in Mornington, with an average attendance of 154, they have two trained teachers, and in Arthur Street School, with an attendance of 160, they have only one trained teacher. I think that is one of the weak parts of the administration of the Department at the present time.

3. *Mr. Wells.*] With regard to the teachers' certificate, would you make that the D certificate?—Yes, I have no objection whatever to the D requirements, provided a good standard of education is set for passing. I think the D certificate provides an adequate outfit for the average primary-school teacher.

4. Then, you would indorse on that certificate the extra qualifications gained by the teacher?—Most decidedly; but that is the only parchment I would recognize.

5. Have you given any thought to the new regulations?—I have.

6. Do you approve of them?—I do not.

7. In what respects?—They make several concessions?—They are a great advance on the old regulations in allowing students to take the examination in sections, but if these regulations as laid down in the *Gazette* are carried out in their entirety it will be practically impossible for a student who cannot get to a centre to get his certificate.

8. You think these regulations will seriously discourage teachers in the backblocks?—Most decidedly. I have no doubt whatever on that point.

9. Supposing facilities are offered by the Boards in the various centres in the holiday time, do you think it would be a fair thing to ask teachers to occupy their holidays in obtaining the practical requirements set out in the new regulations?—If these are the only practical requirements you are going to ask for in connection with science, they are not worth anything. I am speaking now from a teacher's point of view. I do not think you have any right to ask a teacher to sacrifice part of his holidays. I do not think it would be a great sacrifice for one year, and if a teacher has ambition, and is eager to get it, he will not make much demur at sacrificing his holidays on one occasion; but you have no right to ask him to do it.

10. You stated that you think the assistants in a district high school should draw as much salary as a first assistant in any primary school?—Most undoubtedly.

11. Do you hold to that opinion in a case where a man only teaches twelve pupils?—I do. A man who has to do that work has to manage practically six classes, and he must be a man of broad and deep reading, and must be such a man as will command respect from the pupils. If you start with twelve pupils, and put a man of that calibre in charge, the chances are he will increase the number very considerably. I have gone through the work, and I know what it is.

12. Would it be possible to centralize the district high schools in this education district?—Not so far as Otago is concerned.

13. There are no high schools in this education district that could be combined?—No. The distances apart are too great, and the railway arrangements are such as would compel the pupils to be away from home until 9 p.m., and I would most decidedly object to that.

14. Have you given any thought to a grading scheme?—Yes.

15. Will you tell us what you think of it?—I do not approve of it at all so far as a Dominion scheme is concerned. I believe the Otago scheme is as fair and equitable as any system of grading could be, and is very easily worked.

16. Are teachers graded here on any system of grouping?—No.

17. Do you not think it is possible to so grade them in your district?—I do not think it is necessary. Appointments are thrown open to all and sundry, and those who wish to get an appointment send in an application. The Inspectors meet as a committee, and go over the applicants, and make their selection, and recommend to the Board the names of those they think most suitable—four or six names, as the case may be.

18. You recommend directly to the Board?—Yes.

19. In considering the qualifications of teachers, do the Inspectors take into account such matters as attention to environment and interest in things outside the school?—We consider the position from the point of view of the suitability of the applicants for the position they are applying for, and that, I hold, is the only ground on which you can make an appointment.

20. You do not think it would assist you at all if you were to consider the teachers as a whole at certain periods, say, annually, under different headings?—I do not. We are getting the same result by a much simpler method, and we are carrying with us the support of the School Committees, and with the School Committees the support of the parents.

21. Has there been any request for such a promotion scheme from the teachers themselves?—Not so far as I know in Otago; if there has been I am not aware of it.

22. Are you aware that the promotion schemes are in existence in other parts of the Dominion?—I am.

23. And are you aware that they have given very great satisfaction there?—I am not aware of that, except by hearsay.

24. Are you aware that it is generally reported there has been increased efficiency in these districts as a result of the adoption of promotion schemes?—I am not aware of it. That is the first I have heard of it.

25. It is the custom here to submit four names to the Board to be forwarded to the Committee?—Yes.

26. Are they submitted in order of merit?—Yes.

27. Then, there is a difference between the first and last of the four named?—Yes; but these four are all candidates who would, in the opinion of the Inspectors, adequately fill the position.

28. But, still, the man whose name appears on the top of the list is, in the opinion of the Inspectors, ahead of the man whose name appears at the foot?—That is so, but very often the difference is very slight indeed.

29. If there is any difference at all, is it not fairer that the top man should get the position?—Not necessarily. The Committee, who have the interests of the children at heart, should have their requirements considered as well.

30. But surely the Inspectors are better qualified to judge than the Committee?—They do not know the local conditions as well.

31. Is it not disheartening to teachers to know that absolutely the best man is not selected?—You are bound to have disappointed ones wherever you go.

32. You think it is better to satisfy the Committee than to satisfy merit in the teacher?—No; we do our best to encourage merit.

33. Under the system of submitting four names, have you ever known any canvassing to go on?—It goes on in any appointment you like to make.

34. Could there be canvassing if only one name was submitted?—The Committee has by law a right to a say in the appointment, and so long as you have that right laid down in the Act you cannot stop canvassing.

35. The Committee must be consulted, but does that not mean simply that the Committee has a right to express any objection it may have to the name submitted?—Not necessarily. I think the Committee has a perfect right to say whether they will have that man or not.

36. Is it your experience that the sending of four names to the Committee results in canvassing?—It begins before the four names are sent in.

37. Are you Inspectors canvassed?—No. If any applicant canvasses us he is disqualified right away.

38. You find that teachers who think themselves eligible immediately begin canvassing?—Yes.

39. Do you not think that is a very degrading position for teachers?—It is; but the profession adopted it.

40. Has not the profession rather been forced into it by this system of sending in four names?—No; it has been forced on the Committees by the teachers themselves. I blame the teachers entirely for the canvassing business.

41. Do you think the Education Board might control the different branches of education?—That is a matter of policy our Board has considered, and I am not going to express an opinion upon it.

42. Do you think anything might be struck out of the present syllabus with advantage?—My own opinion is that the work of the syllabus depends entirely on the training of the teachers and the earnestness with which a teacher throws himself into his work. The teacher has plenty of option in the work he has to do. As a matter of fact, he has the drawing-up of the schemes of work practically in his own hands, subject to the approval of the Inspectors, and any scheme that gives him that freedom within the limits that our syllabus does gives him a working syllabus.

43. Does not the need for preparation for the scholarships which cover the whole of the syllabus lead to an attempt to cover the whole of the syllabus in the primary schools?—That is a matter of interpretation by the Department. The scholarship examinations are now set by the Department, and if the questions are wide enough, and sufficient option is given, any teacher who draws up a reasonable course of work ought reasonably to meet the requirements of the Department.

44. Would you not approve of the striking-out of any of the mathematical geography, for instance?—If I were a teacher I would not take it up.

45. You would not approve of the striking-out of any of the arithmetic at present set?—No; I think the present syllabus can be easily covered.

46. Do you think there could be any rearrangement with advantage?—Yes.

47. Do you think there is any overlapping in the Second and Fifth Standards?—Yes. Concrete examples are introduced too early in the Second Standard. That might be deferred to the Third Standard, and perhaps a little of the Fourth Standard work put into the Fifth, and so on.

48. Do you think that two term examinations could be set instead of three, as at present?—If I were the headmaster of a large school, and wished to keep a full grip on the school, I should consider that three examinations would not be too many, unless I substituted for one of these a complete examination by the Inspector. Any man who wishes to keep a full grip of what his staff is doing must examine frequently and thoroughly.

49. Do you think there is any need to set out in detail the result of the three examinations?—I do not see the use of examinations unless you enter the results. Personally, I do not think they are examined in a wise way. I think the work could be reduced considerably by a wiser distribution.

50. Do you agree that the Inspectors should be under the Central Department?—I am totally opposed to it.

51. On what grounds?—First of all, the Boards must receive the advice of the Chief Inspectors, or of the Inspectors as a whole. If they were departmental officers it would be a case of the Boards having to consult departmental officers. Then, again, it takes a man some years to get to know

his teachers, and if you are going to make them departmental officers, and transfer them from place to place, you are going to lose that close sympathy that grows up between the Inspectors and teachers. That is a point that is very often lost sight of. There is hardly a teacher in this district whose private life I do not know; and do you mean to say I would have the same sympathy with a body of teachers I was going to visit for a year only.

52. The conditions in this district may be ideal?—They are the same everywhere. There is no man who has charge of a district for some time, and has the interests of the teachers at heart, who will not have some sympathy with them. Centralize the Department, and you make the Inspectors pure officials.

53. Do you think there might be some system introduced by which after a number of years of good service a teacher should be allowed to visit the Old Country or America?—I am strongly of opinion that the £7,000 spent on free books would be much better spent if the Department sent out year after year a travelling commission consisting of teachers and Inspectors, and I should also include architects. I think it would pay this Dominion to have two commissions every year travelling to some outside country to investigate the advance of education in these countries.

54. You think that each Board might be allowed to nominate yearly an Inspector and teacher to visit other countries?—I do not care how you do it, so long as the Department takes the matter up. But it should not be done without a definite object in view. Those selected and sent away should be compelled to bring back a report on educational lines. It is not to be a holiday trip. I think that that system should be extended to every branch of the public service.

55. Do you think it advisable to admit Class B students who have had no previous experience in teaching to the training college?—Under our present circumstances, yes; we must make provision for them in order to maintain the supply.

56. What is your experience of the result of manual work in our public schools?—I am most decidedly in favour of it, and I think it has been most advantageous to our pupils. In this connection I wish to put in an exhibit that I picked up in one of our schools this morning. These are drawings I took from the benches at which the children were at work. That class of work will show you what we are doing in our woodwork course, and you cannot tell me that work is not of educational value. All I can say is that any one who says it is not does not know what he is talking about.

57. *Mr. Kirk.*] You were asked some questions as to the grading of teachers: assuming that such a grading scheme were in operation, and that four men of equal standing on that grade applied for a position, do you see any reason to believe that canvassing would under such circumstances cease?—No, I do not; I think canvassing can only be stopped when you get a proper spirit amongst your teachers.

58. In your experience, naturally you come across some teachers of much less capability than others: could the work of the Inspectors be enlarged somewhat, even by the appointment of additional Inspectors if necessary, to enable them to advise teachers as well as inspect the work of the pupils; or do you think there is no need for such a step?—There is certainly need for it so long as we have a third of the teachers of the Dominion uncertificated.

59. Do you think it would be a move in the right direction to have an advisory Inspector to go round the teachers who require more assistance than others?—If the funds were available, and you could pay a suitable salary, I should say yes.

60. Do you think there is need for it?—Well, so far as our district is concerned, we could do with extra assistance, and then we could do much of that work ourselves. When I recall the number of uncertificated teachers in other districts, and the fact that many of them must be untrained, I quite agree that the appointment of such a man must make for the uplifting of the work in the primary schools.

61. Do you find that the School Committees are fulfilling their functions in the way of looking after the school buildings—speaking generally?—In this district, certainly.

62. Do you know of any case where systematic fumigation is done in this district?—Yes.

63. And of course you agree with such systematic fumigation of schools?—I do.

64. We have had some evidence that there was a good deal of cramming going on?—If cramming means persistent application, then I say it is absolutely necessary to a certain extent.

65. Do you think there is overwork in the schools at present?—Certainly not. What overwork is done in connection with scholarships could be avoided if the number of scholarships were increased materially. It is with that object in view that I advocate an increase in the number of scholarships—to lessen to some extent the intensity of the competition.

66. *The Chairman.*] Then, there is intensity of competition?—There is bound to be wherever you have competitive examinations and the number of prizes is small.

67. *Mr. Kirk.*] Do you agree that playgrounds in connection with schools are necessities?—Most decidedly. The playgrounds in our city schools are quite inadequate for the number of children who have to be accommodated. In the country schools, in the main, the playgrounds are reasonably adequate; but my firm conviction is that we should have not less than 10 acres attached to any rural school.

68. What is the average acreage now?—So far as rural schools are concerned, the policy of the Board is to secure, as far as possible, from 5 to 10 acres.

69. So far as the schools in this city are concerned, is it possible to remedy the evil that exists—at the old Normal School, for instance?—No, I do not think it is, except at an enormous cost. So far as the present training college is concerned, they have a reasonable piece of ground upon the reserve attached to that school. At George Street it is impossible to increase the area, but they have the Botanical Gardens not far away. Albany Street School is in a bad condition for playing-areas, but I think it is quite possible to get a piece of ground from the Harbour Board. In Forbury it is possible to increase the playground to some extent if the Department is willing to

provide the money. I do not think the cost of increasing the playgrounds in the city schools should fall entirely on the Board's finances. It is time the Department realized that adequate open spaces round the schools should be provided.

70. *The Chairman.*] Would you not go on, and say the cost should be borne by the Education Department, the Education Board, and the local authority?—No; I am opposed to local rating, although I am quite prepared to say that local effort should be subsidized for that purpose.

71. *Mr. Kirk.*] Do you know how many children attend the Normal School in Moray Place?—About 288. The roll-number would be about 320.

72. Is there sufficient playground for that number?—No.

73. In view of the value of that site, and the inadequacy of the playground, should the authorities consider the advisability of closing that school altogether?—If you close that school you must provide another, and I am not prepared to say at present where you could put it.

74. *Mr. Poland.*] With regard to the appointment of teachers, is it the occasional practice of the Board, on the advice of their Inspector, to send forward to the Committee only one name?—Yes, when one of the applicants has outstanding claims.

75. When only one name has been sent forward, have you known of any canvassing of the Committee?—You are asking me a pretty wide question. I said canvassing was rife.

76. I understood it obtains generally under the present system?—Yes, especially in town appointments. In fact, some Committees go the length of saying they will not appoint a teacher until they have seen the teacher. That has led up to it.

77. Do you know of any canvassing of the Committee taking place when only one name has been sent forward?—I am not prepared to state a specific instance.

78. Do you know of any case where canvassing of the Committee has taken place when only one name has been sent forward by the Board?—No.

79. But you do know that canvassing obtains when four names are sent on?—I know that canvassing goes on before the selection is made as well as after. That is all the length I am prepared to go.

80. Do you believe that the Committees would be canvassed if only one name was sent forward by the Board?—If you did not get the Committees, you would get the Boards canvassed.

81. I am asking if you believe that the Committees would be canvassed if only one name is sent forward by the Board?—Yes, I do, in the interests of the teachers whose names are not sent forward, and with a view to getting the Board to alter their decision.

82. Suppose the Board made a hard-and-fast rule to send one name forward only to the Committees, and let it be known that no pressure would induce them to alter that rule, and that the teachers in the district were well aware of that rule, do you believe that canvassing of the Committee would then take place?—I do not believe the conditions you speak of can be got.

83. Assuming that these conditions did obtain, do you believe that canvassing would then take place?—My conviction is that you could not get any body of men who will adhere firmly to a rule that they make themselves when they find that local opinion is against them.

84. You do not believe that Boards of Education can be found who will make a rule like that and stick to it?—I do not.

85. You believe that not only would the School Committee be canvassed, but that the Board would be canvassed under that system?—I think it is possible they would.

86. And that the only person who would not be canvassed would be the Inspector on whose advice the one name is sent forward?—I do believe the teachers would canvass the Inspectors.

87. I understood you to say previously that the teachers would not canvass the Inspectors because they would be at once disqualified?—I said they do not canvass us. I am not speaking about other Inspectors.

88. Then, the Otago Inspectors would not be canvassed?—No.

89. And speaking for the Otago Inspectors, you say that no canvassing by teachers would take place?—Yes.

90. But the Board and the Committees would be canvassed?—I say that condition holds now, and will hold under any system. I do not see how it is possible to avoid canvassing by teachers who will demean themselves to do it.

91. Do you think that there are sufficient prizes in the teaching profession to encourage the best talent in the country to go in for teaching?—I am positive there are not. The teachers, as a whole, are very poorly paid. I do not consider there is a prize in the whole service from the top to the bottom.

92. Do you think it is because the salary is so inadequate that so many who enter the training colleges leave to enter other professions?—I am sure of it. I have had this experience: I have had parents come and ask my advice as to whether they should send their boys into the teaching profession or not, and in view of my knowledge of the few prizes to be gained I have been constrained to advise them to go outside the teaching profession.

93. Do you think the general average salary is a reasonable one?—No, it is not. The average salary is not a fair salary at all. Why, a rabbiter can make more than £155 a year. You must also consider the expense of the education a teacher has to undertake before he can qualify.

94. Do you find any difficulty, as Chief Inspector with the assistance of your other Inspectors, in controlling the Otago District? Do you consider the district too large?—I think it is about the right size for working.

95. Would there be any difficulty if the district were increased, and you got an additional Inspector or two?—Yes, we could not get to know the teachers of a much larger district personally as we do now.

96. Do you mean that you yourself get to know them personally, or your Inspectors?—I am quite safe in saying that each of us knows personally 90 per cent. of the teachers in the dis-

trict; and if you had the district much larger that would be practically impossible so far as each one of us is concerned; and as we have to discuss the qualifications of teachers for appointments, it is absolutely necessary that every Inspector should have a personal knowledge of a large proportion of the applicants.

97. We had some evidence given to us by one primary-school teacher in regard to child labour: have you any knowledge of that?—I know that child labour exists to a degree here that requires looking into.

98. Do you refer to the towns or the country?—Mostly in the towns. I would prefer, however, that you put that question to our Truant Officer. I think there are two outstanding industries in this connection that ought to be looked into—one is the Press, with the boys prowling round the streets at night after dark, and the other the milk trade.

99. In regard to free places, you advocate that a bond should be taken from each parent as a guarantee that the child will attend a secondary school for two years?—Yes.

100. Do you think that is a fair thing to ask the parents of some children who have been fortunate enough to obtain a Sixth Standard proficiency certificate, and who are anxious to give their children even one year at a secondary school, to enter into a bond to go for two years?—I am not so firmly convinced about a two-year period, but I certainly think they should complete the first-year period.

101. But do you think a bond should be exacted from any parent in any town?—Yes, I do.

102. Then, you think one year at a secondary school would be simply time wasted?—No; I should not say it was time wasted: it may be to a certain extent useful. My point is this: at the beginning of the year secondary schools and technical schools have to provide certain staffs to meet the requirements of the schools. Well, these pupils drift out, and at the end of the year the managers of the schools find their income considerably reduced, when they ought to have enough to meet the expenses they incurred at the beginning of the year. I think the finances of these schools ought to be safeguarded in some way.

103. Suppose the parent is not prepared to keep his child there because he finds that at the end of twelve months he must take the child away in order to assist in earning a livelihood for the family?—I should be prepared to accept a compromise in that case. I should be prepared to say, "We will release you of the bond if you consent to send him to the technical school in the evening."

104. *Mr. Thomson.*] I think you say the average salary of adult teachers was £155 a year in 1910. I suppose about two-thirds of our teachers are females. What is the average salary for a male?—£201; and for a female £123.

105. Then, you believe in females being paid at the same rate of salary as males?—I do not.

106. *Mr. Davidson.*] What is your opinion of the finished product of our schools as a result of the present syllabus?—My feeling is that the product of the primary school that we are turning out now is as good as any that has been produced in the past. My reason for saying that is that I find the children reading quite freely books outside of their school course. This morning I obtained information from three types of schools, and I find that in one country school the boys and girls of the Third, Fourth, and Fifth Standards have read on an average eight books each from the school library since Christmas-time. In another school I find that in Standards V and VI twelve have read two books, six have read six, and twenty-seven have read more than six since Christmas-time. In a town school I visited this morning I found that the average number of books read by the Sixth Standard classes outside their school-books was six; in Standard V the average was eight; and in Standard IV the average was three. The children are certainly reading more than they did, and I find from my own experience that in their home life they are using their time and leisure to better purpose than they did formerly. I attribute that largely to the introduction of manual and technical training. Then, coming to the scholarship classes, and following the career of the boys through the secondary schools, I find our boys are winning the usual honours in scholarships. They are going through their Matriculation Examinations as freely as formerly, winning places in the Civil Service; and further on, through the University, you find they are holding their own in the scholarship and degree examinations just as well as they did in former times. The children are certainly more versatile than they were some years ago.

107. You find that their stock of knowledge is considerably greater?—The answer is given in the statement I have just made.

108. What is your opinion of the finished product of the training college?—I am convinced they are not receiving the professional training that they should be receiving in an institution of that kind. It appears to me they are devoting too much time to University work, and insufficient time to the work for the primary schools. The Principal of the Training College in Wellington himself makes the statement that we are too idealistic and not practical enough in our training colleges.

109. If the Inspectors under the Otago Board recommended that certain teachers in certain schools should be made models, and the students in the training college were afforded the opportunity of seeing those men and women at work and of taking part even in the teaching, do you think such a plan would add to the efficiency of the training?—Most undoubtedly. It would increase their powers of observation, and they would see some of the best methods it is possible to see.

110. Further than that, if within a reasonable distance of the city there were certain sole-teacher or two-teacher schools in which the teaching was highly efficient, do you think they should also be allowed to see the work of those schools?—I think their opportunities for observation should be as wide as possible, and should embrace all schools and all the best methods of teaching.

111. When the new scale of staffing comes into full operation the pupil-teacher system will be abolished: do you think the number of suitable candidates offering for training will then

be sufficient?—Well, it was reasonable to suppose when the Department established its four training colleges to send out two hundred students a year it made adequate provision for the supply of primary-school teachers, and under normal conditions I think that would have been sufficient. Unfortunately, however, increased staffing has occurred in the last four years in the Grade 4 schools and other schools, and this has absorbed a number of the trained teachers who have been drawn mainly from the training college outgoers and from the country schools. The increased demand for teachers in the country schools has also absorbed some, and the development of technical education has absorbed others. These are somewhat abnormal conditions, and were not anticipated when the Department brought down its scheme for training teachers. It is because of that that I advise the establishment of auxiliary institutions to provide teachers to take the positions offering under the additional scale of salaries. If that is done, I think the number offering of matriculated candidates for such positions, with the probationers, will be sufficient to meet any demands.

112. Do you not think the students who enter the training college would be much better for previous training in practical work?—I am quite convinced that the old pupil-teacher course of four years and then the training-college course was very much better than the one we are having now; but a better one still, I think, would be a two-year pupil-teacher course—a year's course in a training college and then a further course as a student teacher for two years.

113. Suppose arrangements were made to provide a probationer or pupil-teacher or junior teacher in country schools with an average attendance of between thirty and forty, do you think that would make openings for suitable boys and girls from the district high schools to enter the teaching profession?—Well, at present you have two teachers for schools of between thirty-six and eighty.

114. Yes, but my suggestion is that you begin a little earlier—say, when the average is between thirty-one and forty. The assistant would then come between forty-one and eighty?—No, I am not in favour of that. The claims of the girls have to be considered there, and this would result in a man being placed with a junior pupil-teacher or probationer, and the result would be that the infants would be left entirely to that junior man teacher. I think the present arrangement is better.

115. You have not considered the question fully?—Not so very fully. I think, however, the junior teachers should be placed under skilful headmasters, and you do not get the most skilful headmasters in the thirty to thirty-six schools.

116. *Mr. Pirani.*] Do you think the difficulties of the working course in science for country teachers could be overcome if money were provided from the Central Department to enable those teachers to come in for a couple of terms, say, in the year for special instruction?—Well, the Department is doing that now, but it is done at the cost of education for a considerable time in the backblock schools where they cannot afford to lose their tuition. I hold the regulations should be such that the teacher struggling along by himself, with a little aid either by correspondence or personal tuition when he can get it, should be able to get a certificate. Then when he comes to the position where he is teaching science I should insist upon his preparing himself for the science. It is time enough for him to show qualification when he comes to the fifth-grade school.

117. Do you think it would be a good idea to restore the old E certificate, and omit practical science from the examination for it?—No; I would prefer to omit science now, with the exception of hygiene, and insist on the subjects placed down as compulsory in Grades 1, 2, and 3.

118. As regards canvassing for positions of teachers, if it could be eliminated, do you think it would be an advantage?—Most decidedly; but the only way to stop it is to disqualify any member of a Board or Committee who tolerates it, and prevent any teacher who practised it from getting a transfer for two years.

119. Do you not think if it were made a rule that the first on the list in each grade under the classification by Inspectors should be selected that would abolish canvassing—that is to say, if the Board and Committees divested themselves of any power of patronage, and left it entirely in the hands of the Inspectors?—My experience of public bodies of all kinds is that by no system that you can invent or devise will canvassing be stopped.

120. In regard to school libraries, do you think it would be a good thing that there should be a subsidy from the Government in the same way as for ordinary libraries?—I am in favour of anything that will increase the stock of reading-material in the schools, and if the Government will subsidize the school libraries I am quite willing to accept the subsidy. It ought to be done. The Boards have the power to do it now.

121. As to examinations, would you be in favour of two-term examinations by the teachers and a third examination by the Inspectors?—They have power to do it now.

122. Would you have it laid down clearly for certain grade schools?—Yes.

123. *Mr. Wells.*] You were asked with regard to the placing of a pupil-teacher in a thirty to forty school: why should not the place be filled by a woman?—The policy of our Board is not to place a woman in charge of a Grade 4 school in this district.

124. *The Chairman.*] No matter how strong the woman's qualifications may be, would you prefer to turn her adrift?—The Board do not turn any woman adrift. We give them the option of transfer to another school.

125. Do you say deliberately that a woman whose qualifications for teaching are such as to raise a school from Grade 3 to Grade 4 is not fit to teach a Grade 4 school?—Well, the grade is not raised by the capacity of the teacher or of the pupils, but by the number of children attending the school.

126. But numbers do not count for everything?—Yes, the grading depends entirely upon numbers.

127. *Mr. Hogben.*] Do you know of any country where the schools are not graded on the size of the school?—I am not aware of any.

128. Do you know of any basis better for determining the size than the average attendance?—Not for the size of the school, but certainly for grading the salaries I do.

129. Do you know of any country where the salaries do not vary in accordance with the grade of the school?—No; but I think it is quite possible to arrive at a basis of payment that would be absolutely independent of attendance, and I think it ought to be found. I think it is as reasonable to grade the salary of a Postmaster by the average number of stamps he sells, or of a railway official by the number of railway-tickets he sells as to grade the salary of a teacher on the average attendance of pupils at the school.

130. Is not the salary of a Postmaster graded on the average number of stamps he sells and on the average amount of other business he has charge of?—No. There is a system of uniform increases of salaries in those other Departments.

131. Cannot a Board transfer the teacher to a higher grade school?—Yes, if they take advantage of the cumbrous arrangement that the Act has provided in connection with transfers.

132. Have you examined into how long it takes for the grade of a school to fall to a lower grade?—No; I have not examined that carefully.

133. Would you be surprised to hear that in the vast majority of cases it takes three years?—It might take that.

134. How long after that is it that the teacher's salary would fall?—A couple of years.

135. Does that not make a total of five years?—If the facts are as you say, it would be five years; but you have to take this into consideration: that the teacher, recognizing that his school is falling, knows that his salary may be reduced, and has the fear, of course, that his superannuation may be reduced. The basis is most inequitable.

136. Can you suggest any other basis?—I think the minimum salary should be based on annual increments going right through the staff, independent of attendance altogether. It seems to me that if a business-man took this matter in hand he could bring in a scheme which would be infinitely superior to the present system.

137. Is not the same plan followed in every business in the world?—There are not the same arrangements as we have.

138. Does not this system keep the teachers stable for five years practically?—No; I cannot admit that any system of salaries dependent upon such an unstable thing as average attendance is equitable or fair.

139. With regard to certificates, you said you did not think there should be any distinction between the certificates that are issued to teachers who have been through the training-college course and those who have not been through that course?—I did not say that. I say that no certificate issued by the Department should be such as to cast a stigma, implied or real, on certificates previously issued.

140. Do you think if those that had received certificates previously had placed on their certificates that their training had been satisfactory such feeling as you think exists would be removed?—If the regulations issued at the beginning of 1911 were made retrospective, and made to apply to certificates issued prior to 1911, it would, so far as the trained teachers are concerned; but it would not remove the difficulty of having a certificate issued by the training college. My contention is that there should be one teacher's certificate only, and that it should be issued by the Department as the result of rigid examination.

141. Are you aware that the rule in other countries is to issue trained teachers' certificates at the conclusion of the training course?—I am only concerned with what is done in our own country.

142. Are the circumstances any different in this country?—Yes; we have already issued a number of certificates, and we materially alter the value of those certificates by issuing a different kind of certificate; and it should not be done.

143. Are you aware that the only reason why the English department does not recognize the New Zealand certificate is that it does not show on the face of it that it is a trained teacher's certificate?—I do not think recognition by the English authorities concerns us at all.

144. Does it not set a standard for the Empire?—I am not prepared to acknowledge that.

145. I suppose you know this matter has been discussed by the Imperial Conference on Education?—Yes.

146. *The Chairman.*] There is a difficulty you must be familiar with in certain parts of Otago. In those districts where fruit-growing has become the staple industry shortage of labour compels parents to avail themselves of such boy and girl labour as they have—that is, of their children's labour. Can you suggest a way of coping with that difficulty by changing the school terms or otherwise?—The School Committee has power now to close the school at such time as is most convenient to the needs of the district, and it does so. We have not found that the attendance at the schools which are immediately affected by the fruit-growing industry has been reduced during the fruit season. The Committees there, so far as I know, have acted wisely in the time they have selected for the school holidays. It might pay, of course, to revert to the harvest holidays system.

ROBERT FERGUSON examined on oath. (No. 45.)

1. *The Chairman.*] What position do you occupy?—I am Chairman of the Dunedin School Committees' Association.

2. You have been concerned in the administration of education as a member of a School Committee in this district for a great number of years?—Yes.

3. Have you a statement to make?—Yes. I am one of those deputed by the Dunedin and Suburban Schools Committees' Association to give evidence. With regard to school-books, we consider that it is an unnecessary duplication of expenditure as at present worked. Either the children ought to be allowed to bring home the books, or the money spent in buying these ought to be used for some other purpose, because what do we find now? That the parents have to pay

for books through the consolidated revenue, and also in a great many cases purchase them privately. This is only of benefit to the publishers, and an unnecessary tax on parents, whom we represent. Evidence obtained here in Dunedin about twelve months ago showed conclusively that the present system had not worked satisfactorily, and that a change is desirable. It is bad and wasteful policy to make a person pay for two articles when only one is required. We object to this unnecessary expense to the taxpayer. While I am on school-books, I may say that frequent complaints are made by parents shifting from one education district to another that new books have to be purchased whenever this shift is made. This expense should be obviated. What is hard to understand is why a universal set of school-books should not be in use from the North Cape to the Bluff. What is good for one locality is surely good for another. These books should be carefully selected as the best for our requirements. The best is always the best, no matter in what district. I do not profess to be an expert in the delicate and important question of drawing up the school syllabus. I, as a layman, speak with a little diffidence after the authorities you have heard. The most accurate test of anything is the results produced, and judged from this standard I am not at all sure that our course is steered in the right direction. The fault may lie in the interpretation of the syllabus. You have already heard a good deal of evidence from persons who are instrumental in producing results from the syllabus as drawn up. So far as I read that, evidence has been in the main favourable; but I may respectfully suggest that it might be helpful in forming correct conclusions if some of those who have to deal with the product immediately after leaving school were to be called to give their experiences. There is one subject which should be made a strong point of in our teaching, and that is the duties of citizenship in its broadest sense, not only in local matters, but in Dominion and Imperial affairs. Every adult has a vote, and therefore has a direct say in the Government of the country, and it is very desirable that that vote should be cast in an intelligent manner, and we should start early to inculcate in our young minds its obligations in this matter. Prominent questions of the day could be touched on by the teachers on broad lines, and an intelligent interest thereby created; and afterwards essays invited on these subjects, and encouragement given to the children to take a live interest on matters which not only affect their own welfare, but the welfare of others. If this line of thought were started in the child at school it would not be very long before we would be free from some of the queer results our democratic vote gives at present. I would even go to the extent of conducting in a practical manner voting by ballot, to stimulate interest and to illustrate how it is done. As a layman, it appears to me that too much attention is paid to what may be termed classical education. We reward with scholarships students who have perhaps swatted over books, crammed their minds, and thus gained a superficial knowledge—a mere book learning which is very probably forgotten shortly after the examination; while we to a great extent ignore the infinitely more useful student who desires to give a practical turn to his studies. We should direct more attention to the vocation channel—the practical as contrasted with the theoretical; encourage to a greater extent originality of thought and inventive ability as against mere book knowledge. The question of placing a child after he has left school is a very important one to parents, and although this is so, we adopt a very haphazard, happy-go-lucky system. In few cases is any attempt made, either by parents or teachers, to find out the bent of the child's mind, and to place that child to its most natural vocation. Until this is done we are wasting a big part of the money spent on education. When a boy leaves school parents may have a desire to put their child to some occupation already mapped out for him, or they may put him into the first opening offering. In neither case has any indication been given or sought that the boy is suitable for the occupation. By chance he may turn out a success; by chance he may not. But why leave this important decision to chance? Surely we can devise some more exact method of deciding. Could not some system be adopted whereby school records were tabulated under headings to indicate the bent of the child's mind, and subheadings to show the trades or professions this natural bent would lead to. Then every child leaving school could be supplied with a certificate from the teacher clearly showing the points under the various headings. Thus the parents would be able to form a better idea of what to place their child at, and the employer in turn could ask for the certificate, and judge whether it would be advantageous to employ the applicant or not for the work required. If some such system were adopted there would be fewer misplacements in life. Girls without any taste would not be sent to the millinery trade, or boys who would make excellent farmers would not be sent to some genteel professional occupation. There would not be so many round men in square holes. Our present methods do not have any finger-posts to direct the child's natural road in life, and until these posts are erected we are leading the child up to a certain point and then leaving him to chance. If the child goes in the wrong course, we should not blame him or his parents, but we should blame our system of education. Until we fully realize this, and provide for it, we will not get the best results from our outlay. I do not profess to be able to solve the problem of how best to attain the end I am aiming at. I leave this to experts, who ought not to have any difficulty in improving on our present trust to chance methods. I merely direct attention to what appears to me to be a grave omission in our education and the duty we owe to our children. In matters educational, where so much is at stake, I believe it would be an advantage to have a Council of Education, as advocated by previous witnesses. This Council should be composed of various shades of thought, and the practical everyday man of the world should have a say. He is really the man who has to meet the products of our school system, and he is therefore in a better position to judge of the results of that system.

4. *Mr. Pirani.*] Do you think it would be a good thing to have primary, secondary, and technical education under the control of one body?—So long as you have, as at the present time, men who are willing to do that work for nothing, and devote the time to it, I do not think it would; but from an economical point of view perhaps it would. On the whole, I believe it would be best to leave it as it is at present.

5. *Mr. Kirk.*] What is the feeling among the School Committees as to the appointment of teachers? Are they satisfied with the discretion the Board exercises generally?—The witness who is following me will deal with that question; but, so far as I know, they are fairly well satisfied.

6. *Mr. Wells.*] With regard to free books, supposing the children were allowed to take the books home, would that meet the difficulty?—I think so. It would save expense to the children, who now buy them.

7. There would be no objection, then, to the book being handed on to another family the next year?—There might be objection from the sanitary point of view; but I think it would be advisable to allow the children to purchase their own books. It should get over the difficulty if they were allowed to take the books home. A good many of the parents buy books now.

8. *The Chairman.*] There is a practice in Dunedin and suburbs, is there not, of making a charge for what is called pen-and-ink money?—In some schools that is done. I should like to mention also that some School Committees have to go round collecting money for coal and firing for the school. There is not sufficient money from the vote for the supply of coal.

9. You say there is a decided disinclination to make use of the free school-book?—I would not say they are unwilling to make use of them if they are allowed to take them home; but under the present system those children whose parents have not bought them books are a drag on the rest of the class. The teacher has to devote more time to the pupil who, because he has not a book at home, has not learned his lesson.

10. Can you, as a citizen, say whether business men complain that the primary-school education is not as thorough as it was some years ago?—I should not like to express a definite opinion about it, but if you called some of the business men who come directly in contact with the boys leaving school I think you would get an eye-opener. They consider the product of the school is not commensurate with the amount of money spent upon it.

11. *Mr. Hogben.*] Do you consider the money expended upon the supplementary reader is wasted?—I am not in a position to say. If they are allowed to take it home, I think it is all right. I believe there ought to be a good deal of variety in the reading.

JAMES HENRY WILKINSON examined on oath. (No. 46.)

1. *The Chairman.*] What is your position, and whom do you represent?—I am a member of the Dunedin and Suburban Schools Committees' Association, and I am Chairman of the Albany Street School. I have for many years taken an interest in education.

2. Have you a statement to make?—I noticed that Mr. Ferguson, the last witness, made reference to manual work in the school, and I should like to make some reference to the plasticine and cardboard work, in connection with which there has been a good deal of criticism. I should like to say, as a manufacturer, and as one who has taken a practical interest in handwork, on going through the schools at different times and seeing the plasticine work done by some of the children, that they have displayed in a very striking manner wonderful artistic qualities. I have seen children in the Third and Fourth Standards turn out ornamental work that would be a credit to artisans who have been at their occupation for years. I cannot help feeling that many of those children will become artists of whom the Dominion will have reason to be proud. I have no doubt that equally good results are obtained from the other forms of manual work that have been tried at our schools. But the special matter the Committee desired me to bring before this Commission was the powers of School Committees. During the sittings of the Commission some slight reference has been made to the powers of School Committees in the appointment of teachers. In this connection I have to state that, in the opinion of many Committeemen, any proposal to curtail the powers of Committees in the appointment of teachers would be a retrogressive one. At the present time we have something like eight thousand men serving on Committees, and we believe in the majority of cases these men are rendering splendid service to the Dominion. So far as this province is concerned, I think it will be conceded by members of the Education Board, teachers, and others competent to express an opinion, that the system in operation here has worked with highly satisfactory results. One of the main things that has contributed to the success and popularity of our educational system is the amount of local interest that is excited owing to measure of control granted to Committees. Any attempt to reduce the powers of Committees or to lessen their responsibility will result in men of standing in the community declining to give their services. After fifteen years' experience on a Committee and ten years' connection with the School Committees' Association, I am convinced that no body of men could render more loyal service or be more anxious to advance the interests of teachers and scholars than School Committees. Should a vacancy occur on the staff of any of our schools, and there be a large number of applicants for the position, the Otago Board (to their credit) almost invariably send along the names of four candidates, from which the Committee can select the one they think most likely to meet the requirements of the school. I do not think the Board has in any way stultified itself by reposing this confidence in Committees; on the other hand, this privilege gives the members of the Committees a standing, and an interest in the school he would not otherwise enjoy—a privilege that is attended with beneficial results. In some places I believe the practice obtains of sending only one name to the Committee. I hardly think the latter course is consulting the Committee, and am surprised that it is accepted by any live Committee in the Dominion. I am of the opinion that the powers exercised by Committees is an important factor in contributing to the harmonious working of our education system, as only in cases of grave indiscretion are Committees likely to make any complaints against a teacher who has been appointed on their own recommendation. This consideration alone should have considerable weight with members of Education Boards. The more intelligent interest we can get members of Committees to take in educational affairs the better for the whole community. For many years past there has not been any reform of importance brought forward for the improving of the status of the teachers that has not been heartily supported and earnestly advo-

cated by the members of our association. This in itself is an indication of our desire to promote the welfare of the teachers, and should be sufficient proof that any power we possess is used in the teachers' interest. One very strong reason why the work of Committees should be recognized is because of the large sums of money they annually raise for school purposes. If the same liberality and interest is shown in other parts of the Dominion as is shown in Otago, then school funds must year by year benefit to the extent of several thousands of pounds. Many of our schools and grounds in town and country present a very fine appearance owing to the great attention they receive from the local Committees entrusted with the control of educational affairs in the district. As there are several thousand in the Dominion serving in the capacity of Committeemen, instead of restricting their powers in the administration of educational affairs, it would be better to dignify the office, and to make men feel their services are valued by the State. Such an appreciation would tend to develop the highest form of patriotism, and lead to a higher form of service that would be of inestimable value to the nation.

3. *Mr. Wells.*] With regard to appointments, have you ever known the question of a man's religion enter into the question when the names have come before the School Committee?—Only on one occasion.

4. Do you think it right that such a consideration should come in?—Well, there may be circumstances which make it necessary.

5. Have you ever known of School Committee elections to be fought over the question of appointments?—No, not in my experience.

6. Do you think a Committee representing the people in one small area or education district can have any fair knowledge of the qualifications of teachers who are scattered over the whole area of the education district?—I think they would be guided largely by the reports and testimonials submitted to them for consideration.

7. Do you think testimonials can be relied upon?—It depends upon from whom they come.

8. Have you come across any instances of canvassing?—Yes.

9. Do you think it desirable that canvassing should enter into the appointment of teachers?—If I were going to appoint any one to a position in my own business I should like to see the applicants, I think. Personality would probably weigh with me.

10. In making appointments, is it the general practice when a list of four is submitted to appoint the one at the head of the list?—Not always. It may happen that the man at the top has not some particular qualification we are looking for. For instance, we might want a man to assist in the singing, and if No. 3 or No. 4 had that qualification we should select him in preference to No. 1, who had not.

11. Supposing that teachers were to know when a vacancy occurred that the name of the applicant who stood highest was forwarded, do you not think the Committee would be content in knowing that they were getting the best men applying?—As a Committeeman, I should say it was really an insult to the intelligence of the Committee to make them believe they were being consulted in the matter when only one name was sent forward.

12. That would give them the right to make objection to that man?—It would be a reflection on the person whom they reject.

13. Do you not think when four names are sent in order of merit, and the bottom name is selected, it is very disheartening to the three men who were placed above him?—I think, as a rule, the four names sent on are really eligible for the position. So far as our own Committee is concerned, we almost invariably select the first name on the list, unless there are some special circumstances such as I have referred to.

14. You spoke of the difficulty in obtaining coal, firewood, and so on, down here: can you tell us how it is that in one district the whole of the stationery, pens, ink, and everything of that sort, and coal and firewood are supplied free, whilst in another difficulty is experienced in getting them?—There are certain Committees who display more activity than others.

15. I mean that the whole cost is covered by the Board's grant?—It is not sufficient here if we are desirous of doing those other things which we feel are of real benefit to the children.

16. Is the Board's grant expended in any way on prizes?—No.

17. Can you explain, then, how it is that you have difficulty in raising money for coal?—It is possible that some Committees are more liberal than others when making arrangements for their janitor. Some give £40, others £60 and £70.

18. *Mr. Kirk.*] You have been on Committees which have raised money locally?—Yes.

19. Do you get a subsidy on moneys so raised?—Only when they are raised for a specific purpose, such as a gymnasium, when we get £1 for £1.

20. Could the matters for which subsidies are given be extended?—Occasionally they could.

21. Have you been on a Committee which required to extend the playgrounds?—I have not, although we feel in connection with the playground of the school I am associated with that there is great necessity for extending it.

22. Are your relations as a Committee with the Board of the district satisfactory?—Highly satisfactory.

23. *Mr. Davidson.*] You do not approve of the teachers canvassing the Committee?—I cannot say I do.

24. If four names are sent on to your Committee for a junior position on the staff, and two of them are within reasonable distance of the city, and two of them are, say, in Central Otago: do you think it is fair to those who cannot personally canvass the Committee that they should be placed at such a disadvantage?—The last appointment we made was for a junior position, and the young lady who got it was living in Timaru, and I do not think she was in Dunedin from the time the application was made to the time of the appointment.

25. That was a case where canvassing was not necessary?—That is so. The appointment was made on its merits.

26. Do you not think that in many cases if the teacher was not able to canvass the Committee would be placed at a disadvantage?—Quite possibly there are occasions when that may obtain. On the whole, I have found during a long association with members of Committees that they are anxious to do justice to teachers as far as they possibly can.

27. *Mr. Pirani.*] Do you raise any money outside of the money for prizes for school purposes?—Yes, a good deal.

28. Do you not think it would be a good provision to have some assistance given to School Committees as is given to district high schools of £1 for £1 on all moneys raised voluntarily?—Yes, I think so.

29. Instead of the Board giving you £1 for £1 on money raised for shelter-sheds, would it not be better for the Board to erect them?—We felt that the Board had treated us very well just before that, and we did not want to put the Board to any more expense, and we also hoped to get a new school altogether.

30. *The Chairman.*] Is it not matter of history that in this educational district there has been for many years a strong feeling adverse to what is known as the single-name selection?—Yes.

31. Was it not responsible some years ago for throwing out of the service of the Education Board of Otago two of the most eminent educationists we have ever produced?—I believe it was.

32. What chance has your school of getting either a new school or an extended playground out of the grant of the Board alone?—I do not think we have the slightest hope. Our only hope is to get it from the Department.

33. Assuming it is possible to get it by that means, do you not think it would be a fair thing if the City Council were empowered by Act to supplement your efforts by granting a pound for pound subsidy?—There are certain expenses that are incurred that are really for the benefit of the people, and I think that matters of that kind are far better coming out of the consolidated revenue. People are always more willing to pay indirect taxation than a direct tax. I think the Government should bear the cost of school-buildings.

34. If you were told that the experience of other countries is in exactly the contrary direction, and that local effort liberally subsidized not only leads to greater interest but leads to absolute economy, would you be prepared to deny it when we have never tried it in New Zealand at all?—A practice that has been tried in older countries may not be the best to adopt in a new country.

35. *Mr. Pirani.*] Are you not aware that the Government every year provides your Board with money to rebuild worn-out schools, and that in Auckland, for instance, they have got £13,000 put on one side from this very fund that your own Board gets in the same ratio?—I do not know that I am.

DUNEDIN, TUESDAY, 18TH JUNE, 1912.

FRANCES JANE ROSS examined on oath. (No. 47.)

1. *The Chairman.*] What is your position?—I am principal of Girton College, Dunedin, and am an M.A. of the New Zealand University. After a primary-school education, I entered as a pupil in Girton. I was trained as a teacher in Girton College, and became principal in 1900.

2. Will you make a statement to the Commission?—As the representative of the Dunedin private schools for girls I appear before this Education Commission. Nos. 9 and 11 are the clauses of the order of reference to which our attention has been specially directed. Some twelve or fifteen years ago a fairly large number of our pupils came to us after having passed Standard VI in a public school, but of late years the number of these has greatly diminished, and the fact has also been obvious that in what may be termed the "fundamentals" girls are not as well grounded as they used to be. Too many subjects are attempted, and there is thus not time for thorough drilling in the essentials. A pupil who leaves a primary school educated in a few necessary subjects is better equipped for her future career than if she has a smattering of many subjects. We would therefore recommend a more thorough teaching of reading, writing, arithmetic, history, geography, English grammar, and composition, so that in the more advanced stages pupils may be ready to receive and appreciate the rich heritage of our literature. It is not an accumulation of facts that we consider as the true end of education. To equip young people for their future career three essential aims must be kept prominently in view: (1) Training of character, based on a knowledge of the scriptures and the events of our national history; (2) inculcating habits of obedience, politeness, and order; (3) training a boy or girl as efficiently as possible in reading (including a love of good books), English composition, and arithmetic. With these as a foundation at the age of thirteen to fifteen, pupils, by attending continuation classes for a further period, say, of four or five years, should be thoroughly prepared for any career open to them. After the above age girls can be better taught by women, and the study of home management should be compulsory. An ideal training for senior girls would include, as far as possible, instruction under a refined and capable manager in the chief duties and responsibilities of a home. When the ordinary school course is ended there should be still a desire to acquire knowledge, and then the mind of the student is sufficiently matured to know in what department to specialize. The value of the kindergarten is obvious to all who have the interests of children at heart. In the children trained in a true kindergarten these are the main characteristics we have observed: Physical fitness, quick imagination, well-developed powers of attention, alertness of observation, and a predisposition to school and learning. In the kindergarten are formed habits of body, mind, and conduct which are invaluable in later life. It has been truly said, "an intelligent person looking out of his eyes, and hearkening to his ears, with a smile on his face all the time, will get more true education than many another in a life of heroic vigils." With regard to Government examination of private schools, we are not altogether averse to inspection in the true sense of the word, but

once Government insists on the public examination of our pupils we should have to adopt the puplic school syllabus, and the very nature of a private school would be destroyed. It would then cease to be—as it virtually is—under the control of the parents whose children attend it. Our object in establishing a private school is not the preparation of pupils, especially girls, for competitive public examinations, but true education—that is, to draw out their faculties and sympathies, to develop their tastes and perceptions, to cultivate a balanced judgment, and to give them the power not only of acquiring, but of using, what they acquire.

3. *Mr. Wells.*] Why should it follow that if you have inspection by the Board's Inspectors it will mean your adoption of the Government course?—We should have to prepare a syllabus to work upon according to the school system.

4. Would you not simply hand to the Inspectors your course, and he would question on that?—That is true, if that were adopted.

5. Given that the Inspector would test on the course of study you adopted, would not your objection vanish?—Yes, so long as we could develop our own original methods.

6. *Mr. Kirk.*] You know there has been danger in the past through people not qualified to teach starting private schools?—That may be so.

7. You know it, do you not?—Yes, I think it might obtain.

8. Do you think it is a fair thing to parents that such teachers should be allowed to start schools, and the parents be kept in the dark as to the true nature of the teaching their children are getting?—I think all teachers should be qualified.

9. Do you not think that inspection by a Board Inspector is a safeguard to yourself and other schools of good standing?—Speaking for our own school, I can safely say that our staff consists of efficiently qualified teachers.

10. If there is Government inspection, do you not think it would assure to parents that there will be a reasonable education?—Yes, if it is inspection on our lines it would certainly be a safeguard to us in the work we undertake.

11. I understood you to say you were not opposed to the inspection of private schools, but to the examination of these schools on the lines as laid down in the secondary-school syllabus?—I tried to emphasize in the first part of my paper that we have now so many students who come to us before they have passed the Sixth Standard. We begin from the kindergarten and go right through the whole course of training.

12. Pupils come to you at all ages?—Yes.

13. What is the present number of pupils on your roll?—Over one hundred.

14. Their ages range from three or four, to what?—I have some married ladies in my classes. The interest is sustained long after they have left the ordinary school curriculum.

15. Do you say that in the last twelve years there has been a deterioration in the children coming to you from the primary schools?—They are certainly not so well grounded, especially in English. I notice a very great difference in the work in English nowadays compared with, say, ten years ago.

16. *Mr. Pirani.*] Is it the same class of pupils who come to your college now as came ten years ago, so far as parentage is concerned?—Yes, as far as I can understand.

17. To what do you ascribe the falling-off in English of your pupils?—To the fact that the primary-school teachers have so many subjects to teach that something has to be crowded out, or there is not sufficient time to devote to this fundamental work.

18. Do you think it would be an improvement if all the children in the primary schools were trained from the kindergarten upwards?—Yes, I do. I think the kindergarten is a splendid starting-ground for all children.

19. The children who enter your school are not likely to be those who have won free places?—That is so; and I sometimes think we do not get, as we used to do, the cream of the schools in that way. We get more of the average pupil from the city and suburban schools.

20. You get those probably who fail to get free places?—That is so; or children in delicate health.

21. That may account to some extent for the evident want of preparation?—It may; but still we had in the past many pupils of the same standing.

22. You stated that the lack of preparation for entry to the secondary schools was probably due to the increased number of subjects the primary-school teacher has to take: what are the particular additional subjects to which you refer?—I do not know that I can specify what they are. I know they have been increased considerably.

23. Can you say, in your opinion, what subjects should be left out?—No. We have put in what we think should be in, and we leave it to the Board to determine the other subjects.

24. Are they not there already?—Yes, they would be in any fundamental education.

25. And you give it as your well-considered opinion that there is a lack in the children coming to your school compared with ten years ago?—Yes. Arithmetic is very weak compared with what it used to be, and English is decidedly so. History and geography are painful.

26. Is it not a well-known fact that children prepared in the kindergarten come forward for the standards much better equipped than others?—Yes.

PATRICK GUNN PRYDE examined on oath. (No. 48.)

1. *The Chairman.*] You are an ex-officer of the Otago Education Board?—Yes, I was forty years in the service of the Board, during thirty-two years of which I was secretary.

2. Will you tell the Commission what has been the system adopted for many years by the Otago Education Board in relation to the appointment of teachers?—At one time all the names were sent on, even if there were forty applicants, and the Committee were allowed to elect their man. Then a selection was made, but there was no fixed number. Latterly, of course, the Board

has complied with the Act in sending down not more than four, and sometimes two, and occasionally one. That was the mode up to my time of leaving.

3. There was at one time a special selection committee, who, with the Inspectors, selected the names and sent them to the Committee?—That was always so. The Committee was always consulted, and the person recommended by the Committee was invariably appointed.

4. The process now is that the entire Board sit as a selection committee, and are guided mainly, and almost entirely, by the Inspectors?—I would not go as far as that. They are not guided entirely. They are guided mainly. Up to the time of my leaving I can give any number of cases in which alterations were made in the list supplied by the Inspectors. An alteration was made and a name put in that was not on the Inspectors' list, and another that was on taken off.

5. By whom?—By the Board. There is one definite case that I know. The Inspectors submitted four names to the Board. The Board, in its wisdom, struck out one of those names and put on the name of another teacher. That teacher whose name was put on without the consent of the Inspector got the appointment, and it was one of the best appointments in Otago.

6. Do you, as an old and experienced officer of the Board, approve of the system of sending four names, or do you think the Inspector should select the ablest of the applicants, and the Committee only adopt that one name?—I am clearly of opinion that the Committees of Otago are just as capable of making appointments as the Otago Education Board, and I should be very sorry to see the powers of the School Committees curtailed whilst there is such buttonholing and influence being used on members of the Board.

7. In your opinion, does canvassing go on both with regard to members of the Board and Committeemen?—Yes.

8. And it is an undoubted evil in Otago?—An undoubted evil. At one time there was a regulation that it was a disqualification if a teacher canvassed a member of the Committee or the Board.

9. Did you ever know of a disqualification for that cause?—No. The regulation was subsequently wiped out. Members said they liked to see the candidates, and know who he or she was.

10. Is there any ground for the statement publicly made that in cases of the appointment of teachers other questions than the teachers' qualifications have been considered?—I could not speak definitely on that point, but more buttonholing and canvassing go on in and around Dunedin than in the whole of the rest of the district. There may be cases where a man is selected because he is a jolly good fellow, but I would not like to say so. My experience of country Committeemen is that they are anxious to get the very best teacher for their school, and there is less influence brought to bear on them in making appointments than there is in making Dunedin appointments. When a selection of four names is made the applicants do not need to go to the office to ascertain whether they are included in the four or not, because they are written to and informed that their names have been sent on as eligible applicants. Yet what do we find? After the selection committee has met we find a teacher standing at each corner of the street waiting for members to come out, in order to ask if his name has been sent on. If he is told in the affirmative he is off at once, and gets a day's canvassing of the members of the School Committee in advance of the other man who was not able to be in town.

11. Is it too strong to say that this pernicious influence is exercised principally in and around Dunedin?—I would not like to say that.

12. It does exist in other parts of Otago?—No doubt, but it has not been so pointedly brought under my notice.

13. Can you suggest any way by which that undesirable influence could be got rid of?—I have no hesitation in saying that the biggest mistake in the administration of education was the splitting-up of the district into wards. Formerly it did not matter whether a man lived in Oamaru, Tapanui, or Dunedin. He was elected to the Education Board for his worth, and there were always two or three Dunedin men on the Board. We had men like Professor Shand, Mr. A. C. Begg, Dr. Hislop, Mr. Donald Reid, Mr. Henry Harraway, who were elected by the School Committees of Otago, and not merely by the School Committees of a particular district. They represented Otago, and I have no hesitation in saying that Dunedin was as well represented then as it is now.

14. Was it not the fact that the claims of the country and the claims of the towns in those days received equal attention?—Certainly.

15. And to the advantage of education generally?—Yes. I do not think that Dunedin has been one bit better attended to in the last seven years than under the old system. The *personnel* of the Board has not been improved under the ward system.

16. Can you tell us how it is that some services in the schools are rendered free in some districts in New Zealand and are charged for in Otago?—Because the people of Otago are more independent, and like to pay for something themselves. A great number of parents consider it a privilege to provide stationery and pen-and-ink money.

17. To what extent were free school-books in use when you were in the service of the Board?—When introduced there was strong opposition to it by the Otago Board. It was the last in the Dominion, I think, to adopt it. Hundreds of country people have seen me on the subject, and you might almost say they are unanimously opposed to the free-book system.

18. Was the system ever demanded by the City School Committees or parents?—I never heard of it.

19. What do you think is the objection?—I think there is a feeling on the part of parents that they want to provide their own books. I am speaking, of course, principally of the farming districts.

20. There is no objection, is there, to the supplementary reader?—Mostly to the other books. If I mistake not, the Board sent in one or two protests.

21. What is your opinion regarding the complexity of the returns demanded of the Boards by the Department?—One-half of the returns could be done away with. If the Department started off with the belief that the Board and its officers were honest it would be all right. I believe the returns are not as numerous now as they were at one time, but it is an everlasting check to see that we do not make 3 plus 1 equal 5. I do not think many of our returns have come back as being incorrect.

22. Do you think it would be wise or otherwise to submit the general matters of the control of education in respect to the primary, secondary, and technical schools to the Board of the district in order to achieve uniformity of administration?—I was in the office when the high schools and primary schools were under one Board, and if I were in office I would do all I could to keep them separate, because I know what they were when they were not separate. But there are new conditions now, and it is a matter of economy and efficiency, and I do not see why they could not be run together. But when they were run together before it led to the appointment of a Royal Commission and a separate governing body being appointed.

23. Having regard to the judicious system of co-option by which men like yourself, who have got a close knowledge of administration, and whose services could be availed of—would not it be an advantage to have a Board administering these branches of education under one *régime?*—I believe it would, but it is a matter on which I have an open mind. All I can say is I was very glad when the Boards were separated.

24. Do you think the duties of the School Commissioners of Otago, if that body still existed, could have been taken over by the Education Board?—Of course they could. I had control of the School Commissioners' work in the early days, and found no difficulty with it. All the educational reserves were administered by the Education Boards at one time.

25. As a man who moves a good deal among men in business who are in the habit of employing boys who come from the primary schools, can you say whether the complaints made to you, officially or unofficially, as to the quality of instruction given to-day, compare with the complaints made twenty years ago?—There have always been complaints, and they are just about the same to-day as they were twenty years ago. You get hold of a man who is very smart at figures, and he will give a long column to a boy to add up, and because he does not make a good fist of it right away he says the boys are not properly instructed. I do not think things are any worse now than they were before. There is one point that I feel very strongly on, and which I do not think the members of the Commission are conversant with. I think all the other Boards in New Zealand are in the same position. It is the manner in which the Boards are treated when applications come in for the establishment of new schools. An application comes in for the establishment of a new school in a district. There is a printed form sent out requiring the names of the children, their age, the parents, the distance of the nearest school, the distance of the various children from the proposed school, and a lot of other information. That is done, and the Board authorizes an Inspector to visit the district and report on the application. The Inspector visits the district, goes all over it, and reports either for or against the application. If he reports in favour the application is sent on to the Minister on a printed form. Very often the Inspector is accompanied by the member of the Board for the district. The next the Board hears about the matter is that the Ranger, or a Rabbit Inspector, or a surfaceman has been all over the district on behalf of the Government ascertaining if the Board's information is correct. That man reports to the Government, and if he says "No," there is no grant forthcoming. I may say there are very few cases in Otago where the grant has not been got. When the Otago Central Railway was being made one school increased in numbers, and three or four miles further on there was a township established. An application was sent in for a school, and the Inspector reported that the children were attending school four miles away. Some were going up by train and others were walking, but because of the time at which they arrived at the school and the hour at which they had to leave they were only getting about three hours per day instruction. I can quote the case of the Rough Ridge School as a concrete example of what I have been referring to. Unnecessary expense was incurred in making additions to that school, instead of establishing, as we suggested, a school at Ida Valley, as was subsequently done.

26. So that if local knowledge had been followed in the first instance by the Department that expense would have been avoided?—If the Department would simply believe that the Board is honest in its recommendations it would be all right.

27. We may take it that it would make for better relationship between the Boards and the Department if the Boards were trusted more in matters relating to new schools or additions to schools where local interests are paramount?—In all cases.

28. Would it not be advantageous if all questions of local control and matters not involving structural alterations were entrusted to School Committees instead of having to be referred to the Boards for final decision?—Yes; but where are they to get the money. Of course, you must bear in mind that the Board has a good officer expressly for this purpose.

29. Would it not tend to economy of administration if power were given to the local authority to rate for such works, the funds so accruing to be liberally supplemented from the consolidated revenue?—That is a question of policy, and I do not care to answer it.

30. Have you formed any opinion as to the value or otherwise of instituting a Council of Education to deal with all questions relating to the interpretation of the syllabus, and to advise the Minister as to the code of education?—Well, experts meet every two or three years now, and spend a lot of time going over it.

31. What becomes of their consultations?—I do not know. I know that two years ago a conference met in Wellington, and dealt with a number of important matters, but the attitude of the Minister and the Department to that conference was not encouraging. We waited on the Minister, with the result that I think I am perfectly safe in saying he threw cold water on us.

32. Your experience of the one conference you attended was not of a character to warrant you recommending a continuance of them?—Certainly not.

33. You disapprove of the canvassing that is said to be going on in connection with the appointment of teachers?—Certainly.

34. Can you suggest any method by which that evil can be eliminated from appointments?—Get men of backbone appointed to the Board.

35. Do you think, if the Otago Education Board were to abandon their privilege, as is done in Auckland and Wanganui, and the teachers were carefully graded, and the Inspectors alone were the judges as to who had the greatest claim for appointments, that would remedy the evil?—Yes; but is the Inspectors' recommendation to go back to the Board, because if so it is not worth the paper it is written on.

36. But if the Inspectors are to be the final judges as to who has the greatest claim?—From my experience of Otago Inspectors, I should say that would be a distinct advantage; but not if the recommendation is to go back to the Board.

37. You do think that the Boards' Inspectors are the best judges, and are men who might be trusted?—I am speaking of my knowledge of Otago men. I have every confidence in their dealing with such matters; but Inspectors are human, after all.

38. *Mr. Davidson.*] You spoke about the division of the district into wards, and stated that the *personnel* of the Board was not better now than it was under the single district system?—I did, and I went a long way further.

39. Would it not be possible, under a single district system, to have Dunedin and suburbs entirely unrepresented?—My experience long before the district was divided was that a good man, no matter where he lived, was returned to the Education Board.

40. Is it not a fact that under the old system the City of Christchurch was at one time actually unrepresented on the Board?—That was their own fault.

41. In your opinion, have many unnecessarily small schools been established in this district?—No. I am very much in sympathy with the establishing of small schools.

42. Can you think of any school that has been established that in your opinion was unnecessary?—No. There are only two schools that I can think of that were established that had to be closed and shifted, and that was owing to shifting population.

43. Do you think that the school at the junction on the North Road was necessary?—Well, any school that has an average attendance of eighty pupils justifies its existence.

44. How far is that school from the North-east Valley School?—It is not so much the distance as going up the hill face. The school at the junction was established because of the great hardship caused the children in going up and down the hill every day.

45. *The Chairman.*] When the school was planted there is was a necessity?—Yes.

46. *Mr. Davidson.*] Do you think if it were possible to establish a central school, and convey children along good roads, or along the railway, the educational advantages would be very great?—I do not know that there are many districts in Otago where that would work well. In very few cases do the trains run to suit school-hours.

47. You stated that the Otago Education Board was the last to accept the issue of free books?—Yes.

48. Did not the Otago Board refuse because in their opinion the grant was not sufficient?—There may be something in that; I am not sure.

49. At the same time, in your opinion, the granting of free books was a mistake?—Yes, and I do not think the people want it now.

50. *Mr. Kirk.*] As to the cost of administering the Department, are you satisfied that value is being received for every £1 spent?—I certainly think they could do with considerably less staff in the Central Department, if there was less of this error-finding business. I think there is too much looking after us altogether.

51. Speaking of the relations which exist between the Central Department and the Boards, have you any other matters to bring forward out of your experience?—No. I want you to understand that my personal relations with the officers of the Department are as good as they could possibly be. Personally I respect them all. It is this craze for centralizing everything in Wellington that I object to. I believe it would add materially to the success of the administration if there was less of this centralization. If we want an addition to a school, or a change of this site or that, an officer must come down from Wellington to see if it is right.

52. You think the Board should be allowed to decide these matters?—Most decidedly, and should be allowed to say absolutely whether a school is necessary or not without a Ranger having to be sent to report on it.

53. With the exception of these two matters—the number of returns and extension of powers—there is nothing else you can bring forward?—No; I have thought of nothing.

54. *Mr. Wells.*] I suppose the establishment of a school in a country district is considered of very great advantage in the district, and adds to the value of the land?—It is considered a necessity.

55. Have you ever known instances of pressure being brought to bear on members of Boards to get a school established where there is really no need for it?—No. I will say that the Board has never established a school without its Inspectors, plus some members of the Board, reporting on it. If the Inspector opposed the application, it was hung up.

56. Do you know that in some districts of the Dominion schools have been erected where they were not needed, and does that not account for the care the Department has exercised in these matters?—The Department ought to know who they are dealing with. If after all these years they have found out that the Otago Board has never misled them, they have no right to throw suspicion on the Board.

57. *Mr. Pirani.*] Do you know anything about the Replacement Fund which is supposed to be in the hands of the Otago Board? The Department reckon that a certain percentage of the Maintenance Fund ought to be put on one side by the Boards for the replacing of worn-out schools: do you know if the Otago Board has any nest-egg put on one side for replacing worn-out schools?—I do not. The Otago Board has spent all it could get on buildings.

58. Then, is the sum allowed by the Government for maintenance and rebuilding insufficient to allow you to put a nest-egg on one side for rebuilding?—The Otago Board has always rubbed along very well with it.

59. But there is no balance?—No.

60. So the money is insufficient to rebuild worn-out schools in addition to maintaining present schools?—It would appear so.

61. *Mr. Thomson.*] The amount allowed for maintenance of wooden buildings is 3 per cent., and the amount allowed for the reinstatement of worn-out buildings is 3 per cent: are you aware that Auckland has £13,000 set aside for the purpose of reinstating worn-out buildings?—No; fortunate Auckland.

62. Southland has a similar amount. Do you think 3 per cent. is a sufficient amount to allow for the reinstating of wooden buildings?—The matter was gone into at one time, but I really forget the figures. However, 3 per cent. looks very small Our buildings are always being repaired. When the most of these buildings were put up, thirty-two years ago, concrete piles were not thought of, and wooden piles were used, and it is a very costly matter putting new piles under these buildings. Another heavy expense has been connecting with the drainage system, for which the Board has got no assistance. I am sure thousands and thousands of pounds have been spent in renewing outhouses in connection with the drainage system.

63. *Mr. Wells.*] Does the Committee or the Board pay for the water?—I think the Board pays for the water. If the Board had been in a position this last four or five years to put aside the money it has spent on drainage and new outhouses it would have been able to save a very great sum.

64. *The Chairman.*] Is not one of the most unsatisfactory features of the primary system the amount of leakage of pupils that goes on?—I do not know that very much goes on.

65. Is it not over 50 per cent. in Standard VI?—So long as labour is what it is the needy parent will send his child to work.

66. Is it not a fact that the worst form of leakage occurs in the small schools?—Yes, because there the child is of more value in connection with dairying. In many of the small schools the pupils are children of parents who have recently taken up land, and are not very flush with money.

67. Is that not where the uncertificated teacher bulks largely? How many are in Otago at the present time?—I cannot tell you, but many of the uncertificated teachers in Otago are doing better work than the certificated teachers. They are more accurate in their returns.

68. Where does accuracy in the returns benefit the child in the school?—If you get a man who is accurate and methodical in his work you will find he is accurate and methodical in his teaching. I have just one more remark to make. Mr. Goyen in his evidence said he believed that the teacher on the top of the list should get the appointment: he did not tell you on how many occasions his list was submitted to the Board and altered by the Board.

69. Do you know from your official knowledge that when the Inspectors have made a selection of the man who is most fitted in terms of the regulations for an appointment that that recommendation has been turned down by the Board?—Not if one name only was submitted, but if he was one of four, yes.

RACHEL SELINA REYNOLDS examined on oath. (No. 49.)

1. *The Chairman.*] I understand you have been engaged for a great many years in the social life of Dunedin, and have been actively interested in the work of the Dunedin Free Kindergarten Association?—Yes. I wish to lay before the Commission a short synopsis of the views which I hold after long years of work in connection with the training and development of young children. The first thing I consider necessary to remember is that the aim and object of all education ought to be to evolve all the highest and best latent possibilities in the child, and so to help the child to build them into a sound substantial character, founded on the belief that an all-pervading Presence is always with them, watching over them, with a mighty phalanx of helpers, if their aims are high. I consider that practical and experimental teaching should be allotted before any other system where possible. We should begin with the infant of three in the kindergarten, with its many and various methods of interesting work, whereby the child learns the thorough use of its fingers, and of beginning calisthenics and play—the use of all its faculties. This system of using the activities should be carried on as much as possible in the more advanced schools, and the love of work encouraged in every way. No drones or uninterested incapables of any kind should be allowed. We thus open up many and unexpected avenues of interest. Children when practically taught and fully interested can absorb far more than any one would imagine without wearying or suffering fatigue. It is dreary lessons, struggled with alone, that jades the energies. All education should be on broad lines of thought and action, reaching out towards the highest ideals, and should produce the most capable all round citizens, both men and women. It should be essential, even compulsory, that all girls be taken through a simple course of cooking and general domestic work, the keeping of household accounts, and also some lessons in connection with the feeding and rearing of infants. In connection with such a scheme I notice a marked improvement in all those girls who are in the Girls Peace Scout movement. The discipline, drill, first-aid and ambulance, signalling, cooking, cutting out, &c., with their Saturday afternoons on the hills with their Scout leaders, nature-studying, &c., is leaving a beautiful result upon the girls in every way. I observe equally satisfactory results in our kindergarten teachers. It is most marked. Their studies in psychology, nature-studies, &c., and their work

with the infants generally is bringing out very beautiful results in their own characters. In reference to the many complaints which reach me of the growing corruption in young people, and even little children, I would strongly urge the removal of all the undergrowth surrounding the whole town. It is unsightly, it is unnecessary, it is suggestive of evil, and therefore should be removed in order to safeguard those who are too young and too ignorant to realize the agony of mind and sorrow from which they may have to suffer later on. I also refer to defectives: those are a great and terrible danger wherever they are. And, to my mind, without any hesitation, I would have them so treated surgically that there would be no further danger with them. And I feel sure that the poor nature, thus released from the hideous passion which was destroying it, would develop into a placid, helpful, useful citizen. In these days we know that thought is a thing—not an evanescent nothing—much more potent even than ether, for it can bid such things to its use, but wireless telegraphy, the gramaphone, photography, and many other of the numerous recorders of the present day, may bring us the conviction that there are processes in nature which act automatically whereby all our thoughts and actions are preserved to meet us in the certain future. These thoughts should be most emphatically impressed upon the young of this age. Mr. Baker, in charge of Dr. Bernado's Home at Stepney Causeway, assured me that the physical drill and discipline, the general hard work and good training carried on into every trade which it was possible to teach the boys, was, he was sure, the cause of the very small percentage of failures—some 2 per cent., he said—and that from the refuse of London.

JOHN BIGGAR WATERS examined on oath. (No. 50.)

1. *The Chairman.*] What are you?—I am a grain-merchant, residing in Dunedin.

2. You have been for a number of years concerned in the administration of School Committees in your own city?—Yes. I was president of the Dunedin School Committees' Association for some time.

3. You have never been a school teacher?—No.

4. What I understand you wish to address the Commission upon especially is the character of the education imparted in the primary schools to-day. Are you in a position to make a comparison between that system and the system that prevailed some years ago?—Well, business-men are concerned rather with the results than with how those results are attained. What we specially desire from boys coming from the primary schools into business life is a sound foundation upon which we can build their particular training—technical or vocational. As to the boys who come to us from the Sixth Standard, or with proficiency certificates, we find that the handwriting of those boys is not what we would expect. There are exceptions, and there are schools in Dunedin which are exceptions; but I am speaking of the general average. Business people are inclined to think that the handwriting of the boys in the higher classes might possibly suffer from the fact that they now take so many subjects at the schools. They do not seem to be taught the necessity of clearness of penmanship. We do not expect style, but we do expect clearness. Very often we find when a boy has been taught a wrong style it takes some years before he can be taught to write decently. Those ornamental styles are of no use to us. Then, in regard to arithmetic, we find in the average boy the training has not been sufficiently thorough. He has covered a wide field—has been taught rules and problems which he will never by any chance meet with in after life; but the trouble is that he has not been taught the absolute necessity for accuracy. We want him to at least add up half a dozen figures accurately. There is a want of accuracy, in short, in the first four rules of arithmetic; and it is generally several years before we can get him sufficiently grounded to be able to trust him, and to know for a fact that in ninety-nine cases out of a hundred he will add up a column of figures correctly. There are special qualifications and problems connected with the various branches of business, but those things are easily acquired later. Then, with regard to English, the great difficulty we find is that the boys who come to us cannot express themselves accurately either in speech or in writing. They appear, too, to have a difficulty in thinking clearly. In the first place, the average is very deficient in enunciation. It is quite a common thing to have to ask a boy who comes from a primary school to repeat himself when he comes in with the most simple message. I do not know what the reason is. Possibly the old system of giving elocuton, and so on, which was taught in the schools in my time, is no longer in vogue, but there seems to be some want there. I have one boy in my mind now who was the dux of one of the primary schools about a year ago, and that boy has the greatest difficulty in expressing himself clearly, although there is nothing wrong with his voice. And as to writing and composition, I do not know how a boy would fare in an office if he were asked to write an ordinary letter, because no boy is asked to write a letter for his first two or three years in business life. But there is an absolute necessity for training a boy to think logically and to speak distinctly, and for this reason: that letter-writing is now a thing of the past in business. A business-man dictates to a stenographer, and in order to be a successful business-man one must be able to think logically and express oneself clearly. Nowadays we have to dictate thirty to forty letters in a morning on the most diverse subjects, and we let them go almost without correction. I insist on my boys taking English in the technical school, as well as book-keeping. We can teach a boy book-keeping in an office without the technical school, but you cannot give him the gift of English composition. What we want is a solid foundation in the three essentials of education. I do not care a bit about anything beyond that. The difficulty we find is that the boys are fed up with the idea that the moment they leave the primary school their education is finished, whereas it is only beginning. That is really all I have to say as a merchant and as a member of the School Committees' Association.

5. *Mr. Pirani.*] Do you know at what age boys usually get their proficiency certificates?—I think, at about fourteen or fifteen.

6. Do you remember when you left the primary school what your attainments were?—Yes, pretty well.

7. Do you think they were better than those of the boys leaving now?—I think they were much more limited, but I believe we were better grounded in those days.

8. How long was it after leaving school that you were able to take up responsible work?—Of course, I am an Otago High School boy, so that I am not able to judge.

9. Have you been much inside the schools when the work has been going on?—Yes.

10. Have you ever been inside a kindergarten school?—Yes.

11. Have you not noticed that one of the essentials under that system is to get the children to express themselves properly?—Yes.

12. Do you think if such a system as the kindergarten were extended throughout school life you would get a very much better system of education than by the methods we have now?—I cannot say; I can only speak of the results. I cannot criticize the methods.

13. *Mr. Davidson.*] Do you approve of attendance at continuation classes after a boy has entered a trade or business—supposing him to have left the primary school with a proficiency certificate?—Yes, I think it is absolutely necessary.

14. Would you favour compulsory attendance at those classes?—There might be exceptions where it would be a hardship; but, speaking generally, I would.

15. Do you notice that girls, as a rule, enunciate more clearly than boys?—Yes.

16. Do you think if, in connection with the reading-lessons, exercises in phonics and voice-production were insisted upon by the Inspectors it would result in improvement as regards distinctness of speech?—Yes, I am strongly in favour of teaching recitation and reading aloud clearly.

17. You know that recitation forms a part of the programme of work in every standard at present?—Yes.

18. Have you seen much of the writing in the Fifth and Sixth Standards of our primary schools?—I have seen it in one school particularly, because I have been asked to judge the writing on different occasions there. At that particular school I must admit the writing was considerably above the average as compared with the written applications I have received for situations.

19. Do you receive many applications for positions in your business from boys who have been at the high school?—No; we would rather take a boy from a primary shool with a proficiency certificate and build on that foundation than take a boy who had fooled away two or three years, and had not done very much, at a high school. We are very particular about the juniors we get, because we know that the junior of to-day is to be the business-man of to-morrow. Although both my partners and I are high-school boys, we have decided to have no high-school boys there.

20. *Mr. Wells.*] Do you think public opinion would support compulsory attendance at continuation classes—I refer to the general public—the parents, and so on?—That is the difficulty. The average parent nowadays is so convinced that he had a hard time when he was a boy that he is determined to give his boy an easy time if possible. I do not think you can hope much from the parents. They find the children useful after school-hours and after business hours. I think the large majority would be in favour of it, but there would be a fairly noisy minority against it.

21. With regard to the opinion you expressed as to the want of thoroughness in boys, I suppose you know that is a very old complaint?—Yes, but what I think should be insisted upon is quality rather than quantity.

22. *Mr. Hogben.*] With reference to the boys you want to get, you say you prefer a proficiency certificate boy from the primary school to one who has been marking time at a high school. Suppose you could get one from the high school who has spent two years profitably, and had passed the Junior Civil Service Examination, would you still prefer the primary-school boy?—I should not like to say that. If we could get a boy who had made the best use of his time we should naturally prefer him, but the impression we have is—and we may be entirely wrong—that a good many of the boys who go to the high school waste their time there.

23. Have you tried any of the boys who have passed the Junior Civil Service Examination?—No. I have had no personal experience of them.

24. What pay would you usually offer to juniors?—A boy usually begins at 10s. a week. After he has been with us two or three months, and learned the run of the ropes a bit, he would get another 5s. It all depends on merit. At the end of his first year he ought to be getting £1 a week at least.

25. His average the first year would be about £40 a year?—Yes—that is, in offices. In the trades I understand they pay higher. I should like to say this: that the boys we have been getting within the past three years have shown a distinct improvement, taking them all round. I do not know what the reason is. There is an improvement both in arithmetic and in writing, but there is still that curious incoherence in thought and speech.

THOMAS JAMES WALKER examined on oath. (No. 51.)

1. *The Chairman.*] You are chief of the reporting staff of the Dunedin *Star*?—Yes; I am also a member of a School Committee.

2. I understand you have a statement to make?—Under instruction from the management of my paper I have made certain inquiries, as the result of which I have written the following article, which has not yet been published: "Child Slaves.—Over a Hundred of them in Dunedin.—Known as Milk-boys.—Early risers see these boys. There may be three or four about a milk-cart. Quite probably some of these youngsters are out for fun, or to earn a little pocket-money, even for the sake of getting a ride. We admit these possibilities, and grant that many of the boys are, as it were, but semi-attached to the run. In such cases the getting-up early probably does them good rather than harm. They join when they like, and drop out when breakfast is ready. In such

cases no one need interfere. Our concern is with the little fellows who undertake the milk-delivery as a paid job, and are subjected to rules and conditions which entail unfair work and disable them for school duties. Inquiries made by the Truant Officer and the headmasters show that in twelve schools belonging to the Dunedin district there are 116 boys who regularly do this kind of work. The individual numbers per school are 14, 15, 18, 12, 14, 12, 8, 2, 2, 4, 11, 4. Here is a sample of the evidence taken at a suburban school: Fifteen boys were engaged on milk-carts every morning. Their ages ranged from seven to fourteen years, and they were found in the infant-room and in every standard class. These children rose at hours from 4.30 to 6.30 a.m., and were kept at work from two to four hours. Many of them came late to school every day, and on arrival were not in a fit condition for work. The payment received was stated to be from 1s. to 5s. per week; in some cases it was said that the parents also received a certain quantity of milk. One child of seven, who is engaged at this work, was absent from the infant-room, being, as his brother in Standard I said, 'In bed, choked up with a cold.' From the figures supplied we find that the oldest of these 112 boys was aged fifteen years and ten months; there were seven at fourteen, and the ages ran down to three at seven. One of these seven-year-old workers rose at 6 a.m., was out at 6.30, arrived home at 8.15, and had to be at school at 9. Another, aged eight, rose at 6. When questioned by the headmaster, who noted that the youngster was poorly clad, he said he had to meet the cart at 6.30. One can imagine the sort of breakfast he would get before leaving. He was often late for school, and, being asked as to this, he replied that he did his best—that he did not waste time by going home, but waited for his dinner at twenty minutes past 12. This boy had a brother a year older, also engaged with a milk-cart. The ugly fact in their case was that the father earns 12s. a day. When the Truant Officer was asked by our reporter whether he had reason to suppose that any of these boys took on the job for a pastime or to get pocket-money, he replied: 'I would not like to say there are no such cases, but I have inquired, and cannot find any in such a position. In most instances it seems to be pure greed on the part of the parents.' One of the headmasters says, 'These boys come to school more fit for bed than for work.' Another remarks, 'My staff find it most trying to teach these boys. They are languid and sleepy.' In presenting these facts to the public we would also observe that some part of the blame seems to be attributable to the Educatlon Act. Subsection (3) of section 149 provides this: 'A child shall be deemed to be attending a public school, and an attendance may be counted to him, if he is present at the time prescribed by the regulations for marking the register and remains present until the closing of the school.' Now, turn to the instructions as to marking the register: 'The register must be marked every morning and every afternoon at a time appointed for the purpose and indicated in the time-table, and not later than an hour and a half before the closing of the morning school.' There is something wrong here. The morning session closes at 12 o'clock, and the register may therefore be marked as late as 10.30. We understand that in practice it is often about that time when the marking is done. So, though the school opens at 9 a.m., a child is present if he arrives at 10.30. This is the margin that undutiful parents work upon to defy the Truant Officer and to virtually evade the Act. Something could be done by way of patching up this leak if the headmasters were to use their discretion and mark the register early. The making-up of the time-table is the duty of the headmaster; and if he were to fix 'the time appointed for the purpose' at, say, 9.15, or even 9.30, it seems to us that he would to some extent protect these children who are now forced to be late. That, however, would be only a partial remedy for the wrong disclosed. The being late at school is only an incidental evil. The main injustice is in sending children to work at such an early hour as to deprive them of necessary sleep and necessary meals."

3. *Mr. Wells.*] Your inquiries did not extend to the country districts?—No; but I chance to live in one of the remotest suburbs, and have seen a good deal of this milk-serving, as I am up sometimes a little early in the morning for gardening and other purposes.

4. What remedy do you suggest?—I have not thought that out, but it seems to me the parents are greedy, and press their children unduly in this respect. The only remedy, it seems to me, is to shame the parents into better treatment of their children.

5. Do you think it would be possible to institute the licensing of boys so employed so that inquiries could be made and the conditions looked into?—It might be workable; but I have not given the matter consideration.

6. Do you know anything of boys employed late at night selling papers, or early in the morning?—I have no personal knowledge of it. I know when I was a youngster I did my share of it. I used to be up at 4.30 in the morning when I was eleven years of age.

7. Do you not employ boys selling the Evening *Star*?—The office employs runners, who contract with the boys.

8. You know that boys are out until perhaps 9 o'clock at night standing in front of hotels selling newspapers?—I believe they are sometimes.

9. Would it not be a good thing for the newspapers to make a rule that they will not supply runners who engage boys after hours?—I have not thought the matter out. I cannot say positively that it interferes with their school tasks.

10. Ought not the boys be asleep at that hour?—I am not prepared to say to what hours they work, nor do I know what sleep a child requires. It does not seem to be related in any way to the matter I was required to report upon.

11. Have you seen boys employed at the picture-theatres?—Yes.

12. Until what hour of the night are they engaged?—Until the theatre closes—about 11 I should say.

13. Boys of what age?—Apparently twelve or thirteen.

14. Do you not think steps should be taken to put a stop to that sort of thing?—I do not know that I am qualified to give an opinion.

15. Could not inquiry be pursued in regard to night work as well as morning work?—Certainly; but in the meantime I have not pursued it.

16. *Mr. Poland.*] Did you not make any inquiries as to whether the boys who work in the morning are also required to work at night—selling papers, and so on?—No, my inquiries did not extend any further than what is disclosed in this little article. It related to the Truant Officer's trouble.

17. Exactly, as to why certain children were late at school and unready for work when they got there. Do you not think the fact that children are employed to 9, 10, and 11 at night would unfit them for work the following day?—I should think so; but in the meantime I have had no instructions about it.

18. Are you a parent?—Yes.

19. Do you think a reasonable amount of work in the morning for a boy of from eight to fifteen is going to hurt the boy?—No, I do not think so.

20. That is, if he goes to bed at a reasonable hour at night?—That is so.

21. You are not objecting to a reasonable amount of work being given to a boy?—No; I think the more work and knocking about a boy gets, within reason, the better it is for him.

22. As to those boys who are engaged in delivering milk in the morning, do they get their breakfast at 6 or 6.30?—I asked a few questions about that, but it was difficult to get definite information. I gathered that sometimes a boy would get a piece of bread and butter, and sometimes he would get nothing. It would depend upon the boy's home.

23. *Mr. Thomson.*] In the course of your inquiries did you hear it was a practice for boys to get leave of absence from school from 2.30 for the purpose of selling papers?—No, that was not brought to my knowledge in any way.

JOHN ENGLISH RYAN examined on oath. (No. 52.)

1. *The Chairman.*] What is your position?—I am Truant Officer for the Otago Education Board. I have been so employed for ten years. At the outset I would point out that Mr. Walker has covered a good deal of the ground I intended to cover. I might also say that had I known the matter was coming before the Commission I would have got information on a much fuller scale. Three weeks ago I went into the matter, and only have had returns from twelve schools, which, however, I will make available. The position regarding the ages of the milk-delivery boys so far disclosed is that 3 are seven years of age; 6 are eight years of age; 4 are nine years of age; 14 are ten years of age; 16 are eleven years of age; 32 are twelve years of age; 25 are thirteen years of age; 13 are fourteen years of age; and 3 are fifteen years of age: total, 116. 13 boys have to rise from 4 a.m. to 4.45; 31 from 5 a.m. to 5.30; and 72 from 6 a.m. to 6.30. 65 boys do over two hours' work before arriving in school; 36 over three hours' work before arriving at school; 9 over four hours' work before arriving at school; and 6 over five hours' work before arriving at school. Owing to the long hours they have to work, a great number of the boys do not arrive at school until 10 a.m. or 10.30 a.m., thereby losing from one to one and a half hours lessons every morning. According to subsection (3) of section 149 of the Education Act the head teacher of any school has no alternative but to mark a pupil present in the morning or afternoon if he arrives before the marking of the roll—viz., one hour and a half before the closing of the school. During my investigations I found there were several young boys being badly treated by their parents in connection with this work. By section 149 of the Education Act, a child shall be deemed to be attending a public school and an attendance may be counted to him if he is present at the time prescribed by the regulations for the marking of the register—viz., not later than one hour and a half before the closing of the school, morning or afternoon, as the case may be. To show the loss these boys are sustaining, just take, for instance, that there are three hundred school days in the year, and the fact that 50 per cent. of the 116 boys in question lose one hour or more a day, makes the total loss to each boy about forty days in the year. Their late arrival at school in the mornings has a very bad effect on the work classes to which these boys are attached, and is certainly most unjust to their respective teachers. Several of the boys when they arrive at school are quite languid and sleepy, and unable to do justice to their school-work, and I am informed by some of our teachers that it is not an uncommon thing to see boys going to sleep in school. As the Education Act as it is at present has no jurisdiction over these boys as long as they arrive at school before the marking of the roll, I would suggest that the regulation dealing with marking of the register be amended by calling the roll not later than 9.30 a.m.

2. *Mr. Pirani.*] What is your experience about the attendance of pupils generally in the primary schools in the city?—At the present time it is very good.

3. Is the amendment of the Act making attendance every day compulsory an improvement?—A very great improvement.

4. Do you think the defect in regard to that report would be met if there was legislation introduced preventing the employment of children under a certain age before a certain hour in the morning and after a certain hour at night?—I do. When I took office in 1901 the percentage for Otago was 86·7, and at the end of 1911 the average attendance for Otago was 91·8, and for Dunedin City and suburbs the average was 93·1. The matter of boys working after school was also mentioned by Mr. Walker this morning, and during the luncheon adjournment I went into one of the city schools and visited Standards II, III, IV, and V. In Standard II I asked for the boys who worked after school, and three stood up, the nature of their work being *Star* running. In Standards III and IV, twelve boys stood up—two were running *Stars*, and ten were running parcels and messages, and the time they finished was from 6.30 to 7 o'clock. In Standards V and VI, fifteen boys stood up—five were *Star* runners, and ten delivered parcels and messages.

5. *Mr. Poland.*] You do not know whether these same boys are doing work in the morning?—No.

6. *Mr. Wells.*] You have not inquired into the evening work generally?—No.

7. Have you any knowledge of the conditions prevailing in the country generally regarding milking and that kind of work?—Yes. The conditions there are somewhat different. Many people have dairy farms, and the grown-up children have to milk, and after that drive the milk to the factory, and arrive at school late.

8. *The Chairman.*] You, as Truant Officer, I presume, have some particulars of the children who infest the street-corners at night, and of the class of the community whence they are drawn: can you tell from your knowledge whether those children are an increasing number as compared with ten years ago?—No, I do not. I think it is on the decrease. I may mention that the class of boys referred to come from homes where the law has to be carried out in rather a strict manner regarding the school attendance.

9. Is it not a fact that they are the children of parents who are neglectful of parental duty, and against whom you have to enforce the compulsory sections of the Education Act?—That is so. Quite 75 per cent. pass through my hands for irregular attendance, or something of that sort.

10. Are you aware that children of very tender years haunt the street-corners on certain nights when publications of a very "yellow" kind are on sale—*Truth*, and others of that nature?—Yes.

11. It would be better for the community if these children were sent home?—Certainly. It has been a burning question with myself for a long time.

12. *Mr. Poland.*] Is it your opinion that it would be better for boys and girls if they were kept within their own homes after dark, and allowed out on no pretext, such as selling papers, or anything of that sort?—Certainly.

CHARLES RICHARD BOSSENCE examined on oath. (No. 53.)

1. *The Chairman.*] You are an Inspector under the Otago Education Board?—Yes, and have been for the last seventeen years. I was trained in the Melbourne Training College, and had experience of various grades of schools over there. I was associated with the Christchurch (New Zealand) Training College, being method master in the model school. Prior to taking up my present duties I was associated with the District High School at Port Chalmers. I spent four or five years at the University, devoting by attention principally to science. It is not my intention to deal with all the subjects, which have been fully dealt with by my chief, Mr. Richardson. I will deal first with the cost of education. The increasing cost of education is the present experience of all progressive nations—*e.g.*, Germany, France, Britain, America, and Japan. In England and Wales the amounts expended from the rates prior to 1902 did not reach seven millions sterling. In 1910 this amount rose to eleven millions and a half. This is the outcome of a recognition of the importance of education to the well-being of the community, and an acknowledgment of the necessity for having the people well equipped for the battle of life, and for the competition of nations. At times one heard it stated that New Zealand was not getting an adequate return for this—the critic starts discussing the subject from the point of view of money, draws a conclusion, after quoting ratios and percentages, but omits to credit education with anything. In America, where the expenditure on education appears to have no limit, some authorities have supplied this omission by estimating in dollars the enhanced value to the nation of each child as it advanced through the school classes, and American primary education had produced a good credit balance. Now, from a very careful study of the systems, reports, and literature I concluded that, owing to the average attendance of American children being considerably lower than that of New Zealand, the very low percentage of trained teachers, and the short time that the teachers remain in the profession, that the general level of primary education must be higher here than there, and if estimated in coin the credit balance would be such as to impel one to conclude that this country is getting an adequate return for its expenditure, and that is my opinion. We have enlarged our conceptions of true education; we have rightly come to the conclusion that much of the instruction in the past had been too purely disciplinary, too much confined to book instruction, too little related to the future lives of the pupils. It failed to give sufficient scope to the constructive instinct, and by shutting the door on nature had caused many misfits, inaptitudes, and failures in life. The authorities had felt that children have been treated in the mass too long, that the staffing of schools must be increased, and that only by improved methods, good equipment, and by enlisting the services of the best of men and women could we expect to effect that harmonious development that is the aim of true education. This entails increased expenditure, and the work done by the Department on these progressive lines should merit the approval of competent judges. "Overlapping."—This term is frequently used to suggest a defect, but overlapping is sometimes a device for strengthening. There is no overlapping in any sense between the primary and any other class of schools. For though we have a little woodwork in our highest classes, it is not with the object of making the boys carpenters or woodworkers, but of lending additional interest and attractiveness to the school work, as it furnishes opportunity for personal experience, for action, for training of the will, for the culture of the executive powers, and for the development of directive power, and as this branch of the occupations lends itself so readily to co-ordination with other school subjects, educational authorities are agreed upon the desirableness and necessity for including handwork in the curricula of primary schools. Personally, I am so well satisfied with the educative efforts of these manual subjects that I hope the time will come when every school will have its workroom or laboratory, and that the community will be more solicitous about this than about a class-room as an addition to the school. Now, with regard to high schools and technical schools. I am of opinion that owing to the classical atmosphere that pervades the ordinary high school, through its curriculum

being based on University requirements and through the training, or lack of training, of many of the teachers of these institutions, it is inadvisable to attempt commercial education in these schools, but that it should be left to our technical or continuation schools, for the work can be carried on satisfactorily only in those institutions where the teachers are specially trained and specially interested, for in this congenial atmosphere a pupil's progress should be more rapid and the teaching more effective than where the school is vainly attempting to serve two masters. Our technical schools should not be allowed to make encroachments on the province of high schools by training pupils for Civil Service and Matriculation Examinations, but should restrict the work to that of technical character: the English and arithmetic should have reference only to the commercial requirements, and the instruction generally to have direct bearing on the arts and crafts. To secure this requires neither the amalgamation of governing bodies nor the application of some new power, for the departmental Inspectors can control the curricula and see that the special work and that alone is done. There should be no practical difficulty about it whatever. With regard to the work done by our girls' high schools, I think it high time that the authorities should consider the question of a differentiated syllabus in recognition of the essential difference due to sex between the education of boys and girls. The aim and purpose of education cannot be considered apart from environment; it is not enough to think of the formal value only of any particular study, but we are bound to consider training in relation to the life and occupation for which it helps to prepare us. As the domestic arts are so rich in ideas, and may be made the means of extending the circle of thought, is it not desirable that these subjects should be taught educationally to girls? For have not our attempts to make the lady been rather destructive to the production of the woman? As to amalgamation of local governing or controlling bodies, I fail to see that special interests would be served as well as by the separate bodies. At present we have the advantage of division of labour and all the benefits that result from this concentration of attention. If amalgamation did take place you would have Committees set up to deal with these special branches, and these Committees probably dominated by one man who had more intimate knowledge than the others. Thus you would detract somewhat from the prestige, and have, through the lessened number of members, fewer enlistments of the Great Unpaid, and as this service is an important educating factor in society, I think it is better not to lessen the institutions that enlarge local interest. With regard to the financial aspect I cannot see that any saving could be effected by it that would at all compensate for the resultant indirect effects that such contraction would produce. The syllabus has been arranged with the main objects of making the young learner helpful to himself, of training him in habits of accuracy and truth, of teaching him the use of the simplest instruments of discovery, of enabling him to weigh evidence in arriving at conclusions, and by acquiring by such means knowledge that may be serviceable to him in life. In short, it aims at the training of the three H's—head, heart, and hands. Sometimes we hear it characterized as an overburdened syllabus, with too many subjects, the implication being that all the topics are to be treated in detail. This is not the case, for the intention and spirit of the syllabus is that with a number of the so-called subjects the teacher has the privilege of treating only so far as his circumstances admit, economy being gained not through elimination of subjects so much as through elimination of useless, non-essential, and uninteresting matter. I agree with the representatives of the Teachers' Institute that the syllabus is a very good one, the choice of subjects being judicious and suitable, due regard has been paid to their relative importance, and an amount of latitude given to the teacher in the choice of those subjects that are considered merely disciplinary, and a reasonable compromise effected with the practical. The essentials of education are the four R's—the additional R being reality—the study of real things in nature or nature-study. This is not the introduction to the child of a new subject as some of the critics aver, but it is a continuance of his earliest education by nature's methods. In the early life of the child the world of nature is his world. Since I esteem nature-study so highly I am of opinion that more time should be devoted to it in our schools, and to enable that to be done I should cut out writing from the time-tables in Standard IV to Standard VI. I consider writing not one of the R's but rather less than half an R above Standard III as an educative medium. When the pupil has had fair practice, say, to Standard IV, it is merely a mechanical performance, and we should do in school as we do in life—be satisfied with the effectiveness of the instrument. Arithmetic: In the higher classes some algebraical processes might be introduced. Practical work in measurements and problems referring thereto should be introduced. Decimals should be retained—if eliminated as suggested it would tend to delay the introduction of the metric system in New Zealand. Postpone problems to Standard III and Standard IV. Recent conclusions from experiments prove that such work, involving reasoning-powers, can be better left till later—memory best exercised then. Geography: I am opposed to cutting geography from proficiency examination. As this examination is the objective in this class, this most important of subjects will suffer through the teacher concentrating his attention on the few remaining subjects. This is the one subject that brings the pupil in connection with reality—nature-study. "History has been defined as the philosophy that teaches us by examples," also as the "biographies of our great men." Now, in primary schools, owing to the immaturity of the child, philosophizing is out of the question, and having regard to our limitations, I prefer that we should accept the latter definition, and endeavour, by the reading of the biographies of our great men, to lead the child to appreciate the character. History is a subject rather for our secondary schools than our primary schools. I believe the reading of biographical sketches of our great men is the best form of the work for young children, but that history *per se* a subject only for more experienced people. It should be kept in mind that the efficiency of the service is the objective, and that the service exists for the benefit of the schools, and not the schools for the benefit of the service. Therefore, a colonial system should be estimated solely by its effect on education—by its power to remove

present defects and its powerlessness to bring others in its train that would leave education in a position worse than it was before its introduction. The term "colonial system" is a question begging epithet; it appeals to those who have unlimited faith in the efficacy of a centralizing agency to remove inevitable inequalities, and to satisfy unbounded desires. Now, this French worship of system is likely to lead to a disregard to the purpose for which institutions and systems exist. The main purpose of a colonial system is to secure reasonable rapidity of promotion in the teaching profession, with all its concomitant advantages to the general education of the community. Now the rate of promotion is directly related to the numbers of vacancies occurring in the higher position, and as "colonial system" cannot increase the number of vacancies in the higher positions, wherever it has been tried it has been found ineffective to effect rapidity of promotion. If such a scheme were at all possible it would have been effective under such a highly centralized Department as exists in Victoria, but dissatisfaction exists there, more intense than with ourselves. Promotion is slow, and gets slower after that grade is reached that includes the greatest number of schools, with the result that promotion is blocked, and the discontent is intensified by the failure of the State or colonial system to effect what the teachers had been vainly led to hope for, but which from the circumstances of the case it was a physical impossibility for any central agency to produce. But in this respect the teaching profession is not unique. In offices, warehouses, and all other occupations where the prizes are few, we have the same state of affairs—promotion is slow. No system that has yet been devised can find accommodation for thousands in a room that will hold a hundred, or accommodation for a hundred in a room that will only hold ten, and this is analogous to the condition of affairs in all occupations. I have studied the so-called colonial systems that have been brought into existence under the most favourable conditions for their operation, and found that, though they have been honest in their attempt and commendable in motive, they have failed in producing the desired results, while, to my mind, they have brought in their train results most injurious to educational interests by estranging local interest through taking away from Committees all privileges in the selection of their teachers. These circumstances have led me to distrust "colonial systems," for after studying many systems I believe the system adopted in Otago to have fewer of the objectionable features than any system that has yet been devised, and one that is operating with less friction and with greater advantage to the educational interests than any other. This centralizing agency would lessen the power of the Boards, withdraw legitimate privilege from Committees, and do more to kill local interest than anything that can be devised. "That local interest," said Mr. Tate, Director of Education, Victoria, "that manifested itself so strikingly in Otago by the space devoted to education in the Press, by the well-equipped schools, playgrounds, and gymnasiums, largely supplied by local effort, and the interest evinced in these schools that had such an average attendance as can result only from the existence of such local sentiment towards education." The Department has classified the teacher as far as literary attainment and length of service, and has accepted the estimate of his Inspector as regards teaching ability, so a general basis of comparison is provided as indicated by the A1–D5. And this is, I think, just about as much as should be entrusted to any central body, for without personal knowledge of the individual, or special knowledge of the local circumstances of the school—and this no central body of men can possibly have—their conclusion must only be based on the written impressions of others, and their conclusions can be only their estimate of the relative nature of testimonials, as a consequence teachers would then be wise to get service under the complimentary Irish Inspector rather than under the Scotch Inspector, who has a national dislike to committing himself, or the English Inspector who considers it bad form to manifest admiration. The conclusion is that a central Board would entail additional expense, would not improve promotion, and would be no better, or, rather, worse, for forming a relative estimate of the teachers than the Boards are at present. Otago is not a close corporation, and has not been during my experience of twenty-six years. I can name about forty teachers who, in recent years, have come to Otago from other provinces. At different Conferences of Inspectors I have succeeded in getting among others the following motions carried: "That a Council of Education be instituted"; "that it be part of the duty of a teacher to visit at least one other school during the course of the year"; "that Staff Conferences be held during the year in the schools having more than two teachers"; "that a Teachers' Registration Act be passed by Parliament": and these I now commend to the Commission. I consider our system of classification in Otago meets the case better than any other I am acquainted with. Our system, as you are aware, is that all positions are advertised. Applications are received and gone through by the Board's Inspectors. They confer and arrive at a conclusion as to which applicants should be selected, and in requirement with the Act we endeavour to classify then the four chosen. If there is one whose claim is far superior to the others, we advise the Board to send on that name alone. That does not frequently occur. We endeavour to give the names selected in order of merit, and when there is not a great difference between them we sometimes bracket them. The Board prefers that we should put them in order of merit. That being done, the Inspectors meet the Board in Committee. The Board goes through the names, and ask why such-and-such has not been included. We give them the reason, and as a general rule our decision is accepted. In fourteen years I only remember one alteration being made by the Board in the order in which the names have been sent up by the Inspectors. The names having been adopted by the Board, they are sent on to the School Committee, who accept one of them. Sometimes the first on the list is accepted, and sometimes it is not. We ensure that whichever name is selected that teacher is a capable person for the position. When No. 1 is not accepted, it is not the case that No. 4 is always accepted. We have a knowledge of our teachers, and also local knowledge of all the schools, and the consequence is that we seldom have misfits. I think if some of the small Boards were amalgamated and some of the larger Boards reduced a similar system could, with advantage, be adopted throughout New Zealand. The enlarging of the smaller Boards by amalgamation

would give teachers a chance of getting appointments in a better class of school than was at present open to them. With regard to the registration of teachers, I may say that at the present time the teaching profession is the only profession in New Zealand which is not protected. Any one can put up a signboard and start a school. It would not be so bad if a lawyer was to do that, because he would only be enabled to fleece his clients. In education, the effect was far-reaching, and the public have an idea that they are getting what they are paying for. In Dunedin, I am informed of a case where a young lady would not be accepted as a pupil-teacher by the Inspectors. We considered her incapable as a teacher, yet she starts as a kindergarten teacher. I think it is necessary that every teacher should be registered as a proof of certain training and a certain degree of education. I also think that all private schools should be open to the departmental officers to see that the children are being properly taught and housed. I understand that certain kindergartens are being held in second stories when there is no necessity for it. If a fire broke out in the institution it would be a perfect death-trap. Furthermore, there is such a risk of accident to the children in going up and down the stairs. I think there should be some State supervision over them. The next point is the want of teachers. How can that be improved? I do not know. What seems to influence most in the choice of a profession is the possibility of getting a decent prize. In the education profession there are no prizes. Your Inspector-General is underpaid. He is a man who should get at least a thousand a year, and if he had been in any other colony he would have been getting it long ago. I know much talent that is being employed in our schools which if devoted to commerce or other professions would bring a competency to their possessors, but, fortunately for the world, teachers are largely philanthropists. But there is no reason why the State should carry philanthropy to such an extent. More prizes might be made in the profession. It seems to me that nothing should be done to prevent retirement from the service after reasonable years of service have been gone through. In Germany, I understand, teachers can retire after ten years of service, but I am not inclined to think that our Superannuation Fund could stand such a liberal provision as that.

2. *Mr. Pirani.*] What would you think was a reasonable school population for one Education Board?—About 250 schools.

3. You think Auckland District is too large?—I do.

4. Have you had any experience of this canvassing for billets which has been mentioned in evidence?—I consider that the evidence that has been given in that connection is a gratuitous insult to the members of our Board. Canvassing will exist as long as human nature is what it is, but to suggest that it is of the intense form here that was stated by a witness is beyond the question altogether.

5. Your Chief Inspector said it was rife?—I would not say it is rife. If a teacher waits upon a School Committeeman he is said to be canvassing. That is not canvassing, to my mind. If I was a School Committeeman I should certainly like to see the applicants for a vacant position. It is important that the Committeeman should see the man who is to teach his children or the children of those who have intrusted him with his position.

6. Do you think the average School Committeeman can judge a man by his appearance?—Some can, some cannot.

7. Do you not think that the Inspectors are the best judges as to whom is the best teacher for a particular school?—It frequently occurs that a number of teachers are equal; and that is why, with other reasons, I would give a choice to the Committee.

8. Have you ever tried to put down in figures the comparative qualifications of teachers?—I have, and I have found that a number of them came out equal. I trust my general impression rather than figures.

9. Do you not think there are no two men in the world equal?—Anything is possible—I mean, equal relatively to a particular vacancy.

10. If two men are equal, do you think an injustice is done to the man who is not selected?—If one of the two equal men was selected I do not think an injustice would be done, because the other man would get another position. To take away from the Committee the privilege of selecting a teacher for their school is to lessen the local interest of the Committee in that school.

11. Do you not think it is an unfair thing if a teacher has proved herself capable for a certain position, and has done special service in a particular school, and you have no fault to find with her, that she should be taken out of that position and asked to accept a lower position?—In a general policy anybody may suffer, and what you have stated is just an accidental case. Has the teacher suffered in any case? The Board did not, as some one suggested, shunt her out of this position. I assert the lady was not shunted. The Board found an assistantship position for this lady in a city school. The Board also offered her another country school of equal grade, but she would not accept that, because she did not like the locality. Then the Board put her into a position at Caversham, going out of its way to confer with the Committee, and to get her to accept.

12. Was the salary less than she would get in a Grade 4 school?—I cannot tell you what the salary was.

13. You say you would be in favour of a central council of education, but only as an advisory board?—Yes.

14. Do you think it would be efficient as an advisory board?—I think so.

15. Do you think you could get men of high standing to act on such a body, when there would be a danger of their decisions being set on one side?—I do not know, but I think it would be worth trying. It has been done in Victoria.

16. Do you not think a similar experiment might be worth trying in regard to secondary and technical schools?—Yes.

17. The suggestion is that there should be one body controlling the three systems of education—primary, secondary, and technical—with advisory boards controlling each institution?—Yes, but I do not support the idea of having one body controlling the three systems.

18. Why do you think that would not work satisfactorily?—Because of the indirect results of it. You would lessen local interest. In the present method you have a division of labour: you have the Education Board, a High School Board, and a Technical Board. Each of these Boards is concentrating its attention on the one branch, and we all get the benefits of concentration. If they were amalgamated, what would happen? These special divisions would be delegated to Committees, so that you would have the same system in operation, only you would call them committees.

19. Do you not think there is an advantage in unification of control?—There might be some advantages, but I am not prepared to say I would sacrifice the present advantages for them.

20. Do you classify your schools in this district as to efficiency?—Yes.

21. From 1 to 10?—No, we have general terms—fair, good, satisfactory, very good, excellent.

22. Have you any schools that are known as observation schools, where teachers can go to watch special methods?—No, except that we send them to the Normal School.

23. Do you not think it would be a good thing to have in each grade of school a specially selected observation school, at which teachers should be given an opportunity to spend some time?—I think it would be a very good thing.

24. *Mr. Davidson.*] We heard something about the difficulty the Board had in regard to the establishment of schools, and two were mentioned—Rough Ridge and Ida Valley: have you any personal knowledge of this matter?—Yes; there is a place called Rough Ridge on the Otago Central line, and some five or six miles distant there is another place called Ida Valley. During the time the railway was being constructed the attendance at the Rough Ridge School rose, not only on account of the railway population, but on account of some settlers being at Ida Valley. The train facilities were such that the children could be taken from Ida Valley to Rough Ridge. The Ida Valley people requested the Board to establish a school there. The then Chief Inspector and myself were in the district, and we reported adversely on the application, because there were good train facilities for carrying the pupils on to a better class of school. The Department sanctioned a grant for increasing the accommodation at this Rough Ridge School. As the railway was extended a portion of the population was taken away from Rough Ridge, and the train times were also altered, with the result that the travelling facilities for the children going to Rough Ridge no longer existed, and the attendance fell so that the Rough Ridge School became a one-teacher school. The people at Ida Valley made representations to the Board, and the Board established a household school at that place. This went on for some time, and then, owing to the growth of population at Ida Valley, the residents made further representations to the Board, and on my advice the Board acceded to the request to establish a school. The Department also agreed, and the school was established. The building was part of the addition made to the Rough Ridge School.

25. So, in your opinion, it is not correct to say that the Department flouted the wish of the Board?—Not at all.

26. The Board and the Department, then, were working harmoniously in connection with these matters?—Yes, and that has been my general experience.

27. I understand you consider the Auckland Education District is too large?—I should think so.

28. If that district were so reduced as to lessen the area very considerably, and lessen the number of schools by, say, at least one-fourth, and the attendance by one-third, do you think it would then be within reasonable limits?—I think so. It is all in connection with the classifying of teachers and the efficiency of education. I think it is a good thing that Inspectors should know their teachers thoroughly, and get into sympathetic touch with them.

29. If that were done, you would have just about the same number of schools and the same number of children as in Otago and Southland, so could not Otago and Southland be worked as one district?—They might.

30. Would that not give the teachers in the smaller district greater opportunities and a wider field for promotion?—It would.

31. *Mr. Thomson.*] I understood you to condemn the Victorian system of promotion utterly: have you knowledge of any other system?—Yes, the New South Wales system. They are much the same. They do not give what they profess to give: they hold out false hopes to the teachers.

32. Would it not be better, instead of creating a few more better-paid positions, to give promotion by regular increment to salary, such increment to depend on years of service and educational status?—I agree with you that suggestion would benefit the majority, but you want something for the teachers to aim at. I am still of opinion that a very important factor is the prize, but at the same time I believe our teachers are inadequately paid.

33. Making a few more prizes would not suit the average teacher, because he would never reach them?—That is so.

34. *Mr. Poland.*] You believe that School Committees should be consulted in the appointment of teachers by forwarding to them the four names the Inspectors consider most qualified for position?—I do.

35. Do you think a Committee is consulted in regard to an appointment when the Board only forwards one name as a result of the Inspectors being of the opinion that that teacher is very much superior to any other candidate?—We must safeguard our teachers. We admit the fallibility even of Inspectors, but when we are sure that the qualifications of one teacher are outstanding, then we do not think that that teacher's promotion should be jeopardized. We find our system works very well.

36. When the Inspectors consider that the merits of two of the applicants are equal, or about equal, and there are two others a little behind them, then the whole four names are sent on to the Committee, and it has the choice of the worst of the four?—Nobody is bad.

37. Surely one is worse than another?—I do not admit it. They are all good. The Committee may not take the best, but they take a good teacher. We consider the teacher at the top of the list is the best qualified, but there is not very much difference between them.

38. Is it not a fact that while the two men at the top may be almost equal in order of merit, still there may be a considerable difference between their qualifications and that of the man at the bottom of the list?—No, that cannot be so.

39. Then, you sometimes only send on two names?—Yes, and sometimes three. Our difficulty is usually in selecting the fourth, because we have so many.

40. You do not approve of consulting the Committee when the Inspectors are of opinion that one applicant is superior to any of the others?—We do consult the Committee, because they have all the names and testimonials of the other candidates; but we only send on one name. They can object to that name, and state their objections to the Board, and if valid, the Board will not appoint.

41. In regard to the case of the lady teacher whose school passed from Grade 3 to Grade 4, I suppose that resulted from a rapid increase in the population?—That is so.

42. Do you believe that a teacher's salary should be dependent on the number of children attending the school?—No, and I wish a system could be devised by which it did not. I cannot suggest any other way.

43. The only reason for changing the teacher in this case was owing to the increase in the size of the school?—It is the policy of the Board. We believe that, in the interests of the district and in the interests of education generally, a man should have charge of such a school.

44. Was this lady's salary reduced?—I cannot tell you; it might have been. I know it was a hardship, but she was the victim of a policy.

45. Have you any suggestion to make with regard to a reduction in the cost of education without impairing its inefficiency?—I have not. I see the cost increasing everywhere—it is a mark of civilization.

46. What do you think of the proposal to amalgamate a number of the small schools?—I think it is very good if it can be effected. It is a thing I have tried to effect here. I have seldom recommended the establishment of a small school if it was at all possible to get the children conveyed to a larger existing school. But the great difficulty is in getting the children conveyed, because the settlers are so well off that they will not undertake the conveyance of the pupils at the rate offered. Usually the man who is willing to undertake the work has not the capital to buy the necessary outfit.

47. Do you think there are places in Otago where it could be carried out?—I know places where it would be well if it were carried out, but owing to this difficulty it cannot be done.

48. *Mr. Kirk.*] In regard to this question of the Grade 3 and Grade 4 teacher, your Board is simply following the plan which is followed by every Department. Take the Police Department, for instance: If a police district grows in size a sergeant replaces a constable; or in the Railway Department, if a station grows in size a Stationmaster succeeds the porter in charge?—That is the principle.

49. A young teacher might be sent to a Grade 3 school, and within twelve months that school might jump to Grade 4, and you believe in such a case it is in the best interests of education that a man should be put in charge?—Yes.

50. Is it not a fact that the lady teacher is not reduced in grade, that she is transferred to a third-grade school?—If a third-grade school is available our Board will transfer her, but if it is not available she might suffer. The principle of the Board is that she should not suffer. It is a question of sex in this particular case.

51. In regard to the suggestion that there is cramming in the schools, I would like to know your definition of cramming?—I think cramming is memorizing a lot of useless information—working the memory rather than the perceptive powers.

52. Does that go on to any extent in the schools?—Teachers have not time for anything of the kind.

53. You say there is no cramming in the schools?—No; there is memory work, of course, as I think there should be. I think there should be more memory work in the lower standards.

54. It has been suggested to us also that the children are overexamined: what have you to say about that?—I do not think so. It just depends on how the three examinations are carried out. It is well that a headmaster should come into personal contact with the pupils and their work as frequently as possible, and these are the formal occasions on which he does. It is very good, too, I think, that a child should have to meet formal occasions in school life. It is one of his preparations for life. Unless the headmaster knows exactly the attainments of the individual pupils he can only form a rough estimate of the effect of the general teaching of his staff.

55. Mr. Pinder, speaking as the representative of the Teachers' Institute, told us that a teacher had to spend three months of the year in examinations?—If he says so I believe it is true.

56. Is it right that a teacher's time should be taken up for three months in examinations?—I should think three months is too much, and if it is found to be absolutely necessary to provide that time I should say, have two examinations rather than three. I am surprised to hear it is taking that time. Of course, the examination is a very important part of teaching.

57. Are the teachers satisfied with the classification scheme that exists in Otago?—I know of no general discontent. I do not think there is dissatisfaction.

58. So far as you know, the scheme is working well?—I have no indication but that they are satisfied with our efforts to carry it out.

59. *Mr. Wells.*] Do you mean that the teachers here are classified?—I spoke of the Government classification. Then we classify them relatively to the positions they are seeking, and that is what I regard as the excellence of our system. We do not classify them absolutely.

60. Have you any classification list of teachers drawn up in which all your teachers appear?—Yes; that is a private affair to send to the Department.

61. Do you ever take marks off under that system?—Yes.

62. And does that appear in the Government *Gazette?*—No; but we have the information for our own guidance.

63. You spoke of the need for the inspection of private schools: do you think it is sufficient to give Inspectors the right to inspect without the right to test?—No; you require to test. I am quite satisfied on that point.

64. Have the teachers for the most part throughout this district houses attached to the schools?—I should say yes, the large proportion have.

65. Are the houses always equal in value to the house-allowance attached to the school?—I really have no knowledge of the rental value of houses.

66. Are you in favour of the abolition of scholarships in towns?—No.

67. Would you be in favour of restricting the scholarship to an allowance sufficient to cover the cost of books in the case of town pupils?—Yes.

68. In that case would you increase the amount for boarding-allowances for country children to bring in a larger number?—Yes.

69. It has been suggested to us that the smarter boys do not get fair consideration in the public schools, that they are kept back in order to mark time with the duffers: do you think there is anything in that?—I would not go as far as that. I should say that I think a child much above the average might often be promoted quicker, instead of waiting for a year. That is particularly the case in our large city schools. A recommendation I have been making to the teachers for some years is to teach the large classes in two sections.

70. In Auckland we had the suggestion made that, in order to get over the difficulty and do justice to all, it would be advisable to group the Fourth, Fifth, and Sixth Standards of the city schools into three schools, and have a large number of subdivisions in each class, and allow a bright boy to go on as quickly as he could, and give a duller boy ample time?—It seems an ideal scheme, but I can see some practical difficulties in the way. In Dunedin, for instance, perhaps the Third Standard would be located at this end of the city, and a child attending from the other end would have to travel some distance. And, again, the younger children are often taken to school by the elder ones. I think there would be public sentiment against it.

71. That is the chief difficulty, to your mind?—Yes.

72. Referring partly to the lady teacher who was removed from a Grade 4 school: supposing a young man fresh from a training college was appointed to a small school, and for any reason it suddenly develops at a very rapid rate, would you be in favour of removing him in order to place an older and more deserving teacher in the position?—I should be in favour of that. I think that would be quite fair.

73. The system you have outlined as in operation here in connection with the appointment of teachers was in operation in Auckland—it was the custom to send four and as many as six names to the Committees. Do you know that that system has been done away with, and a grading scheme introduced?—Yes.

74. Do you know that has given immense satisfaction to the teaching profession?—I do not know that.

75. Do you know that it has been indorsed by every branch of the Teachers' Institute?—I do not know. I was up in Auckland recently, and while I was there I read a speech delivered by the Chairman of the Board in which he referred to all the virtues of this scheme. The next day I saw a letter from a Committeeman, who expressed very great dissatisfaction with it, and since I have returned I have heard that this dissatisfaction has called into existence a Schools Committees' Association, so it would seem as though local interest is not satisfied. I place great weight on that local feeling.

76. You are quite satisfied that many of the education districts are too small?—I think so.

77. And you would recommend the amalgamation of the smaller districts, as conducive to the best interests of education?—I think so.

78. I think you said the object of a colonial scheme was to obtain quicker promotion?—Or certainty of promotion.

79. Would you not rather say it was to obtain reward for merit?—I will say it is for that purpose if you like.

80. Given larger districts, with grading schemes in each, and annual or biennial conferences of Inspectors, do you not think it would be possible to evolve a grading of teachers for the Dominion so as to allow of transfer from one district to another?—It might be. I have not given great consideration to it. I think it would be an advantage if such a thing could be effected.

81. Do you know that at present, with the smaller education districts, there is a lack of opportunity and a lack of prizes for the teachers in them?—Decidedly.

82. And that teachers are often anxious to get into the larger districts, but find it difficult to do so now, owing to the fact that there is no standard of comparison?—I have heard it said that Otago is a close corporation, but that is contrary to fact. Anybody may apply for a position in this education district, and we have instructions to treat every application on its merits.

83. *Mr. Hogben.*] With reference to the marks forwarded to the Department by the Inspectors, do you remember any discussion at the conference of Inspectors with regard to this matter?—We certainly did discuss it, but I forget the particulars about it.

84. Do you remember that some difference was found in the marks assigned by Inspectors in different districts, especially mark 10?—Yes.

85. Do you remember that it was on such ascertained difference of estimate that it was generally agreed that the Department should not lower the marks?—I do not remember that.

86. In regard to the suggestion to concentrate the upper standards in the town schools of the large cities into two or three central schools, have you thought about the disadvantage that would result from the destruction of the corporate life of the schools?—Yes, that is one of my objections to it.

87. *Mr. Thomson.*] I suppose you have sometimes heard an uncertificated teacher spoken of as though he were totally unsuited for the teaching profession?—Yes.

88. I suppose in your experience in Otago uncertificated men have done very creditable work?—Some of them.

89. Do you think the uncertificated backblocks teacher should be permitted to take the D examination in more sections than two?—I think it would be a good thing.

90. You recommend that?—Yes. I should allow him to take it even in single subjects.

91. Do you think that would help to solve the difficulty of the uncertificated teacher?—To a very great extent.

92. *Mr. Pirani.*] Have you ever done anything under a system of transfer to reduce a male teacher in position in the service?—Yes.

93. Have you had many of these instances?—No. I can only remember one case.

94. Have you ever used the system of transfer for the purpose of promoting teachers?—I cannot remember an instance.

95. Do you not think it would be a fair thing, instead of advertising all your positions as open to anybody who applies, that specially qualified teachers in the eyes of the Inspectors should be promoted by a system of transfer?—That is going to take away the legitimate privilege of the Committee, and that is what I attach such importance to.

96. You do not believe in the use of the transfer system except to reduce a teacher?—I do not say that. I think it is more important that we should maintain local interest and the legitimate privileges of the Committees. That system might be to the benefit of the teacher.

97. What do you refer to as local interest? What is the manifestation of local interest?—In the first place, by the way they put their hands in their pockets; next, by the way they read up everything in connection with schools, and also the interest they have in seeing to the welfare of their children.

98. Do you know how much has been raised in this district in the last two years by School Committeemen putting their hands in their pockets?—I do not know, but there must have been a good many thousands of pounds since I have been here.

99. Would you be surprised to know there has been very little raised in the last two years?—Perhaps they have all they want. They always give when we want it.

100. *The Chairman.*] Do you not think that, in the case of a highly qualified teacher who is hit by falling attendance, the Inspector's influence with a Committee would induce them to accept such a teacher?—It has been done.

101. Is it not a fact that in this district no woman need apply?—No, because it is not true.

102. What is the educational qualification of the lady teacher who has been mentioned—is she a B.A. of the New Zealand University?—Yes.

103. Has she not taught in every school in Otago in which she has been placed with credit to herself and satisfaction to the Inspectors?—She has.

104. Did she succeed in teaching the school in which she was last placed before it rose to the third grade to your satisfaction as Inspector?—She did.

105. As soon as the school touched thirty-six, was she not given the choice of the school at Otakau?—Yes.

106. Is it not one of the most remote districts a woman could be sent to, having regard to the ordinary conveniences of civilized life—a Maori settlement at Otago Heads?—It is a country place on the harbour. There are disadvantages in connection with it, as there are in connection with every other place. It was the best position the Board had available.

107. What I want to know is, how comes it that what cannot be done by the Otago Board can be done by the adjoining Board in Southland?—The policy of the Southland Board is different from that of ours.

108. Where does the national system of education come in?—I suppose it is local, or our Board would not have done it.

109. Is that not one of the matters which a Council of Education would be likely to correct?—It would produce uniformity of administration, and, generally speaking, I should think it would have good results.

110. *Mr. Davidson.*] In referring to the colonial scheme of promotions in Victoria, were you referring to the one most recently brought into operation?—Yes, and the other one too.

111. The one you referred to more particularly was that where the Board, by classification, raised the teachers annually. Do you know that salaries are classified now and not schools?—Yes

112. Is it not a fact that since these recent regulations have been brought into operation the teachers are much more satisfied than formerly?—I think some of their grievances are removed, at any rate.

113. *Mr. Kirk.*] It has been suggested that the lady we were speaking of received less salary in the position to which she was transferred than she got in Grade 3?—Of course, I have nothing to do with salaries.

114. *Mr. Davidson.*] Had this lady remained in her position, would she not have had a considerable increase in salary? Would she not have received £180, rising by annual increases of £5 to £210?—Yes.

SAMUEL MORGAN PARK further examined. (No. 54.)

1. *The Chairman.*] Touching this confusion of ideas as to the efforts of School Committees to raise funds for local purposes, what amount has been raised in this district during the past two years on which the Board grants a subsidy?—I understood the question was as to the amount raised locally by the School Committees. During 1911 the amount raised in this district for this purpose was £3,400. That, of course, does not go through the Board's funds at all, and is not shown in the education papers.

2. But it is disclosed in the balance-sheet?—Yes, and from that I have just taken out the amount, thinking the Commission might require that information.

3. *Mr. Pirani.*] I notice in your annual report the receipts for school buildings include contributions, £105 7s. 11d. How can you say, therefore, that no local contributions are included in your balance-sheet? Then, again, in your annual report you say £80 5s. 9d. was received for school libraries: how can you say no local contributions are included in your annual report and balance-sheet?—I except those two items. They are very small. I meant to say the total amount raised by School Committees was £3,400. The amount of that which goes through the Board's funds is very small, and, so far as subsidies on buildings are concerned, the Board does not require that the amount raised locally shall pass through the Board's fund. It accepts the Committee's statement that the amount it has raised for this purpose is such-and-such a figure. The amount having been certified to, the Board pays its part of the subsidy.

4. *Mr. Wells.*] What rate of subsidy does the Board pay?—It pays at the rate of £1 for £1.

ANGUS MARSHALL further examined. (No. 55.)

1. *The Chairman.*] I have thought it necessary to recall Mr. Marshall to explain with reference to the alleged overlapping in the District High School, the Boys' High School, and the Technical School, of which he is Director. He will possibly explain, on the commercial side, at all events, what the points of difference are, if any. We shall be glad to hear what you have to say, Mr. Marshall?—In the Technical School, although some of the work may be on the same nature as in the High School, the basis is somewhat different. In the High School a much broader foundation is taken up. General principles are instilled; while in the Technical School we take, as it were, the narrower road, and proceed more directly towards the object in view. For instance, we may say that in the work in English and mathematics we have our minds solely upon the goal or the application of the work in the ordinary business of life. Commercial education has been mentioned. Well, with our commercial work we interweave our English and our commercial arithmetic. We teach English as a part of our shorthand, and part of our typewriting, and part of our general correspondence. In the High School they would give a much more efficient instruction in English than we do, but the foundation would be broader. They would go in more for general principles. We, as it were, take the necessary English and the necessary arithmetic that will make an efficient office stenographer or assistant. Many pupils come to us who do not wish to undergo the more arduous training of the high school. Many, again, will not come to us because they require a less arduous training; and they go to private institutions, where they are tied down to shorthand and typewriting. We occupy a kind of middle position in that way. The point is that the work we do is special work, and if asked whether the High School could undertake it I should say it could provided they had the special staff, special rooms, and the special appliances. There is no guarantee, however, that they could do the work either more efficiently or more cheaply. Assuming they could do it, there would be several disadvantages to contend with. For instance, we require something like forty rooms for our evening classes. Would the High School provide those rooms for the evening classes? I think the answer would be a prompt and emphatic "No." Then, are these rooms and these special teachers to be kept idle just because, owing to some sentiment or other, we are regarded as duplicating or overlapping in some way. Then, if you have teachers and accommodation, why not utilize them in the day time. I do not wish to labour the point, but there is just one other point I would mention. Although I am maintaining that it is impracticable, costly, and impolitic to combine high school and technical school work in a city like Dunedin, where you have such a number to cater for that you must have separate rooms, and so on, it is just the reverse when you come to the smaller centres such as Gore or Gisborne. In those centres you have not a sufficient number of pupils to provide work for, say, one man to do science all day and keep his laboratory employed. If in those places you kept high-school work and technical work separate you could not provide an efficient instructor for one class of work only. Then it would be an advantage to combine the two; but in the larger centres you must have separate institutions, and it is not overlapping, because it is not the same class of work.

2. *Mr. Davidson.*] In the smaller districts, I understand, then, that in the high schools you would have three separate courses, any one of which a boy might take—say, the classical or English course, the commercial course, and the vocation course?—Yes, I should provide for three courses, but I should not use the word "separate," because you can combine some of them. I should, however, separate those which could not be combined efficiently.

3. *Mr. Kirk.*] Do you happen to know that, where technical and secondary subjects are taught in the same school, the technical subjects are taught at the expense of such subjects as English, arithmetic, and, generally speaking, the three Rs?—I think that is so.

4. Do you know that in the secondary schools where technical subjects are taken the students who sit for such examinations as the Matriculation, the Junior University Scholarships, and so on, do not come out well?—Yes, and it is because of this very thing—that they do not provide separate courses. They provide a conglomeration. I do not think the pupils taking the different subjects are properly classified, and I think a scheme of classification could very easily be drawn up.

5. *Mr. Hogben.*] You said, I think, that you would never establish a separate technical school in a district which is only able to keep a district high school: do you mean a day technical school?—Yes.

6. Would you use as much as possible the district high school building for evening work for either technical or other classes?—Yes, there is no need to duplicate the rooms and the appliances in any district.

7. *Mr. Pirani.*] If in a small town there is a district high school which has no special appliances for teaching science or anything of that sort, but there is a well equipped technical school in that same town with provision for all courses — scholastic, commercial, machinery construction, agriculture, and so on—which are being conducted in that technical school, which would you say should be abolished—your technical or your secondary department of the district high school, there being an equal number in attendance at each school?—Then I should say the district high school should be combined with the technical school.

GEORGE CASHMORE ISRAEL examined on oath. (No. 56.)

1. *The Chairman.*] You are a member of the Otago Education Board, and I understand you have for a good many years taken an active interest in the education work of the primary schools in Otago?—That is so.

2. Have you a statement to make?—Yes. As the ground seems to have been fairly well covered by previous witnesses I will confine myself to a very short statement. Speaking with the diffidence of a layman who claims a more than average interest in the cause of education, I venture a few personal opinions for what they are worth: (1.) It has long been impressed upon me that numbers of small schools might, with advantage to all concerned, be closed, and arrangements made for teaching the children living within a radius of, say, ten miles at a well equipped and more efficiently taught central school. Undoubtedly the general education in such a district would gain in efficiency from the efforts of higher-grade teachers, who, under the improved circumstances, might more readily be secured, and the general improvement would, I imagine, be reflected in the homes and surroundings of the pupils. Such a system of centralization or grouping has been successfully tried elsewhere—notably in New South Wales, where children are conveyed to central schools by both wagon and motor launch. It must, however, in Otago, at any rate, be a condition precedent that suitable roads should exist, and that the Board of Education should have those reasonable means placed at its command for the comfortable conveyance of the children to school. (2.) I think the Board of Education should have its position strengthened with regard to the supervision of private primary schools, or of schools which admit children of primary school age, other than those under its control. It is believed that such supervision would be welcomed by the authorities of private schools. Indeed, inspection by the Board's officers is already sought by the Roman Catholic schools here. No efficient private school of such a class—and there must be a number here—need fear the tests already applied by the education authorities to their own State schools. (3.) In any measure for the reform of the administrtion of education in the Dominion, it would, in my opinion, be unwise and impolitic to weaken the privileges and responsibilities of School Committees, which are admittedly a potent factor in our scheme of administration. One has only to compare like conditions in the States of the Commonwealth with that which obtains in the Dominion to realize the fact of the great value of our School Committees in the educational life of the community. The large sums of money raised annually and the persistent activities of these bodies of intelligent and enthusiastic workers give ample evidence of their unquestioned value to the State.

3. *Mr. Wells.*] You are of opinion that something more might be done in the way of centralizing the country schools in this district?—I do not know that anything has been done. The difficulties have been too great. Visits to the different districts have somewhat cooled the ardour of those who were anxious to see such a consummation. I myself have pressed this matter once or twice, but when I got into the Catlin's district, for example, and saw the conditions which prevailed there, especially as regards the state of the roads, it somewhat cooled my anxiety to see the schools grouped. So that I think we must wait until roads are provided for the children. I think, however, there are many places where grouping might be carried out with advantage.

4. Do you find there is opposition in the country districts to any suggestion to centralize?—We have never brought it forward forcibly enough yet to encounter opposition, but from points which have been brought before the Board from time to time I should say opposition would be encountered under the most favourable circumstances.

5. Still, you recognize that centralization would make for efficiency and economy?—Yes; and more than that, it would make for morality and everything else. I think there would be a wider outlook. I have been somewhat staggered to see the conditions in those small country schools that are isolated, and where the children are under improper parental control. It would, I consider, be an advantage for those children to get their training in a large school, even on the side of morality, where there would be a better class of teacher and better supervision. And the association with perhaps a better class of children than themselves would, I think, tend to improve those children, and reflect again upon the homes of some of the parents.

6. Have you anything to say as to the amount of the grant allowed for the conveyance of children?—We have always tried to do our best with the sixpence allowance, but it has not been sufficient. In urgent cases we have received a little more consideration from the Department, but even that does not cover the ground. My opinion is that something more should be done by responsible parents in the district towards that end. I think where people go to live in isolated districts, and find there is a difficulty in getting their children to school, they should be prepared to make a little self-sacrifice by coming to an arrangement to take the children in

rotation in their drays even. They might contribute their share to the education of their children in that way. It is already done in one or two places I understand, but the idea ought to be extended.

7. Have you anything to say as to the size of the education districts. As you are aware, they vary greatly in size, though the cost of administration varies inversely in proportion to the size?—It does strike me as an absurdity that one or two of the education districts should have separate administration of the education of a number of children little larger than some of the Christchurch schools.

8. You have not found the Otago District in any way unwieldly as regards administration?—No, it is easily worked, and we keep in pretty close touch with all our schools.

9. You are able to keep a more efficient staff of Inspectors in a large district than in a small one?—Yes.

10. There is more for the teachers to look forward to in a large district, and that would have a good effect on education generally?—Yes.

11. Do you think it is possible for the Education Board to take charge of primary, secondary, and technical education in this district?—I used to think so, but having now a more intimate knowledge of the secondary and technical school-work, and its administration, I somewhat hesitate to say it would, unless the central body could be assisted.

12. I am presuming there would be efficient local Committees?—If you could get efficient Committees it might be so. My reason for saying that is that since I have been a member of the High School Board and the Technical School Board I have been in association with a number of fine men, well equipped for their particular duties, and I should be sorry to see such men ousted from such positions.

13. Would they be ousted under a system of co-option?—If they would accept the position of co-optative members it would be all right.

14. Has the Education Board here given any thought to the question of the grading of teachers by the preparation of a promotion list?—It has just been mentioned across the table, but it has not met with much response.

15. You think members of the Board would not care to give up the patronage?—Well, we find the present system so satisfactory that we are not looking for a change.

16. Has the practice of canvassing come under your notice?—I want to know what you mean by canvassing.

17. I mean the interviewing by teachers of members of the Board with a view to furthering their chances of having their names sent in for particular positions?—I am always glad to see and talk with teachers for my own personal reasons, and, although the teachers may have something in view when they call, our relations are satisfactory, and I have taken no exception to it. I do not think it influences members of the Board at all unduly. We depend largely upon our Inspectors' reports.

18. Do you invariably take your Inspectors' recommendations?—Almost. I would not say quite.

19. With regard to the continuation classes, do you think public opinion would sanction the attendance at continuation classes being made compulsory?—I think it would. There is such an amount of interest taken in education here that I think the public would support any movement in that direction.

20. Have you given any thought to the question of the levying of rates locally for the maintenance of school buildings, providing of playgrounds, and extension of equipment, subsidized by the Government?—Yes; but I should not like to say as to what effect it would have. We have never found any difficulty in raising money here, and such a system might possibly tend to curb the generosity of the people, and might therefore do more harm than good.

21. I suppose there are a number of residents who never do give?—Yes, but generally the parents are generous here. Any school movement or entertainment is wonderfully well patronized.

22. *Mr. Kirk.*] You are a bank-manager, I understand, and as such you would come into contact with boys as they leave school: have you noticed any want in their educative standing?—I think not. I would not like to say they are better than they used to be, but there is no difference so far as I can see.

23. Do you approve of the teaching of typewriting in the secondary schools?—No. The same applies to shorthand and book-keeping. I think the time might better be spent in the teaching of more necessary subjects.

24. *Mr. Poland.*] When you spoke of improving the moral tone of schools, did you mean to imply that the children attending the small schools are less moral than those attending the larger schools?—We have had indications to that effect. The discipline of the larger schools would be better. There is a good deal of uncertainty about the teachers we get in the country districts.

25. Have you had any experience of the children in the very small country schools?—Yes, I have visited them occasionally, and we get information from the Inspectors at the Board's table.

26. Do you think the conveyance of children in vans daily to and from school to a central school would lead to improvement?—I think so.

27. Would you be in favour of making attendance of free-place pupils at a secondary school compulsory for two years?—Yes.

28. *Mr. Thomson.*] Do you consider there are any directions in which money is wasted at all in connection with the administration of education in this district?—Speaking generally, I think we are as economical as it is possible to be. I think, however, the money spent upon the free school-books is practically wasted. I do not think they are at all necessary.

29. *Mr. Davidson.*] Is the teaching profession as popular as the other departments of the public service?—I think so.

30. How, then, do you account for the vastly increased number of uncertificated teachers?—Well, we understand from the Inspectors that the term "uncertificated teachers" is a misnomer, in a sense. Numbers of them have missed their examination in some subject, such as music or something of that kind, and therefore remain uncertificated. Otherwise they are able and competent teachers.

31. We were told in evidence to-day that on the evening on which appointments are to be made teachers are to be found waiting at the street-corners ready to button-hole members, and rush about canvassing in order to get ahead of their fellows, and then they start with a tremendous handicap over their fellows?—I do not know whether it is more an insult to the Board or to the teachers to suggest such a thing. It is absolutely untrue and absurd.

32. What is the practice of the Board in sending on names for vacancies?—The Inspectors go through the applications, and select four, and the full Board as a selection committee consider the applications and the selection, and in ninety-nine cases out of a hundred the choice of the Inspectors is accepted. Sometimes it happens that there are special requirements for a special district, which the Inspectors have not recognized and it is open to any member of the Board to call attention to the special requirements. It is very occasionally that such a position arises. It is the almost invariable rule that we accept the recommendations of the Inspectors.

33. Do you not think it would be wise, as in Auckland and Wanganui, to make the selection to be sent on to the Committee, seeing that in ninety-nine cases out of a hundred you adopt the recommendation of the Inspectors?—I would not like, even for the sake of the one out of the hundred, to forego my opportunity. I think the members of the Board have a certain amount of responsibility, and the final responsibility should be with the Board.

34. Can you tell me how many instances there have been in the last twelve months in which only one name has been sent on to a Committee?—I cannot tell you. It has certainly not occurred in the case of important schools. It has only occurred in the case of outside schools.

35. Would you say that in twenty cases in the last year only one name has been sent on?—Yes, I think so—an average of one or two a month.

36. Was that generally in unimportant out-of-the-way places, where few applicants were forthcoming?—Yes.

37. *Mr. Hogben.*] How would you make the attendance compulsory for two years to free pupils?—By doing much in the same way as we adopt in the technical school, for what it is worth, by way of a bond. It is a sort of moral obligation, but I do not know that we could enforce it in law.

38. Would you have the Act altered so as to make it possible to enforce such a bond?—Yes, I would.

39. Supposing a parent got an offer of employment for his boy—a parent of limited means—do you think it would be fair to require of that poor parent that he should repay the amount of the bond, which I suppose would be the whole or part of the fees?—In all circumstances there is consideration for poor people. That position could be met.

40. Are not the majority of the cases of that description?—I think too many go into the high school to get the cachet of the high school, which is considered by many a better recommendation than coming from the primary school.

41. Supposing a boy left to go into employment, and attended an evening technical school after he was employed, would you enforce the bond in a case like that?—No; an arrangement could be made by transfer.

42. *Mr. Davidson.*] In districts too small for both a high school and a technical school, would you agree to the high school having three courses—classical, commercial, and vocational—so that boys might make a choice, as is done in America?—That is a question for experts.

43. *Mr. Pirani.*] Would you call Lawrence District High School a minor appointment?—No.

44. Are you not aware that in two instances at least only one name was sent on to the Committee of that school for a vacancy?—Yes, but it was not with my will.

45. Did you receive any protest from the Committee about it?—Yes, I think so.

46. *Mr. Poland.*] Do you believe in the selection committee retaining their present privilege with regard to the appointment of teachers?—I do. I was associated with one Committee in Dunedin—the Union Street School—for twenty years, and in that time we raised £1,500 in voluntary contributions.

ABRAHAM MORRIS BARNETT examined on oath. (No. 57.)

1. *The Chairman.*] What is your position?—I am headmaster of the Kakanui School, and have been teaching under the Otago Education Board for thirty-two years. Contrary to the generally accepted opinion, I hold that a knowledge of too much reading-matter is required from the scholars of the primary schools; that the *School Journal* for Standards V and VI, consisting as it does of over thirty pages each month of issue, would require greater attention on the part of the teacher and scholars than does the ordinary reading-book, the place of which should not be taken by the *Journal*. That so much reading-matter—the ordinary reading-book, the *Journal*, the history, and Geographical Reader—prevents the proper study of any, and has a tendency to confuse the children, and leave on their minds quite a fragmentary knowledge of any subject. That it is hurtful to the physical growth of the weaker children. Your Commission has the evidence principally of strong men—men who, because their bodies have given them strength to read and study much, cannot conceive of the feelings of the weak. Heavy reading to the weak, not necessary in intellect, though having a tendency to epilepsy, hysteria, &c., so confuses their powers of grasping what they are set to learn, that they may either refuse to work—in olden days take to truant-playing—and so save their bodies, or break down under the strain.

I am quite willing to submit these assertions as facts to the opinion of such a critic as Dr. Truby King, whose knowledge of mental suffering is second to none in the Dominion. As a relief to mental study all, when desiring rest, hasten to lighter reading than that which has been compulsory. Hence you find children taking to the "penny dreadful," those miserable scribes that glorify the wrongdoers and make as victims to his success in wickedness the guardians of law and order—make a hero of the boy that can defy the schoolmaster, &c. Nature-study and overmuch reading make for a contradiction:—

Where are your books? that light bequeathed.
To beings else forlorn and blind.
Up! up! and drink the spirit breathed
From dead men to their kind.

The eye it cannot choose but see;
We cannot bid the ear be still;
Our bodies feel whate'er they be,
Against or with our will.

That to have fluent reading there must be a complete visual memory of what it sees at a glance. A good sight-reader is one who can see every letter in each word, and all the words of a line, and when coming to end of a line several of the words of the next line. This ability should be acquired in the infant room by steady study of the build of the word, or even by the supposed out-of-date alphabetic method. Tense expressions can only come by quick reflective and imaginative powers. Seeing something of life will give these quicker than much reading-matter. In the Third and Fourth Standards I would rely upon oral work, with good pictures and maps for the teaching of history and geography. Such a nation as the Maoris would hand down by oral tradition its history. Such stands during the infancy of nations, and in such a manner would I teach the infants of a mature nation. To do this the teacher must have a thorough knowledge of his subject, and at the same time must be himself on a level with his pupils. In printed matter very often a language is used almost foreign to that used by the pupils. In oral teaching the instructor—I use the word for history in these classes—would or ought to use language readily followed by his listeners, a language at once vivid and simple, enthusiastic, and full of fire according to the particular branch of the subject he has in hand, and the eyes of the pupils will follow the light given by his eyes and facial glow. The primary idea of geography is locality. In no sense should the beginner learn a list of names of places; but before he can properly learn of places he should be able to locate each in the picture he has of the map. With a map before a pupil such pupil should be able to almost blindfold point out where a place is. Say a person takes up a newspaper and reads the cablegrams; to enjoy his reading such a one should be able to locate, without continual reference to encyclopaedia or the index of an atlas, each place of which he reads. Oral teaching prevents this learning by rote, and enables the teacher, who, of course, must know his subject, to paint on the imagination of his pupils something of each town and country. Such pictures will assist him in such work. I want no books for such work, though good books of travel to be read at the pupils' leisure I would encourage. I am in favour of a limited amount of physical and mathematical geography. I would hold that the syllabus should just say, "Teach geography," giving the teacher full scope to choose his own methods. The Inspectors ought to be able to say if there be any educational value in the method chosen. An experience of twenty years in the school garden tells me that much may be done for the pupils and for the farmer by nature-study and technical education. Oh, for a strong body to do all I have in my mind! The formation of soils, their nature obtained by mechanical analyses, and what would enrich them or make them more workable might be taught. Among an Education Board's teachers of agriculture should be a biologist; the pests and plagues of the garden cannot too early be observed. I have known the ladybird condemned as eating the turnip-leaves, that the grub and not the moth spread the plague in potatoes. Such errors have been corrected by my pupils by experiment and observation. Besides, the work of the hands is such a relief to mental prostration. Medical inspections: No matter how thorough is the teaching of hygiene it is worthless without practice. What good are the laws of dairying if the farmer be not compelled to cleanse his separator. And the inspection of teeth is no good if the parent or the State prevent not the running pus from entering the stomach—during the past five-and-twenty years I have extracted teeth for my pupils and others—or if the pupil who cannot see the words on the blackboard be not compelled to wear glasses. One great need in our schools is the lavatory. One has to order his pupils to wash by the aid of clay and the tap. He must run about till that portion of his body wetted dries. The foregoing are the results obtained by an experience of thirty years in country schools, and I would, with your permission, say a word on encouraging men to enter upon such work. Women, in the opinion of Inspectors, may do as good work as a man, but a single woman who does not look forward to the keeping of a husband cannot do the work of a married man. I have had perhaps the misfortune to be always located some distance—once thirty-seven miles—from the residence of a doctor, therefore I here speak, as I have done in other cases, from practical experience: it has therefore happened that both my wife and myself have had to do many things in the district in which we worked that no single woman could have done. Is it, then, too much to ask that men who have such responsibilities should be better paid than single women, and should have the preference when promotion is in hand. To encourage men to enter upon such work, the State should consider their wives. Surely the widows of such men deserve a pension equal to that of the old age. Death to the ordinary man has no fear, but the feeling of no provision for his loved ones urges him to fight for justice. One may be moved by acts of chivalry to fight for the single woman, but our mothers are the foundations of our nations. Destroy the foundation-stone by neglect, and the whole will fall to the ground. Defective children: The State is wisely doing something for

the boys among "God's innocents." For years, with the aid of literature supplied me by the late Robert Burns, F.R.C.S.E., I fought for the training of these children. The work of the State so far is good, but only the half is being done. Defective girls require special care and treatment. I have never taught in any district without finding one or more. And where such children, among the female sex, have long and lonely roads to travel before reaching home there is always a chance of boys of low moral tone taking advantage of their innocence. In fact, all girls starting work at the ages of thirteen or fourteen require special treatment. In factories, &c., they should work but six hours a day, and one hour should be given to study in daylight if they attend technical schools.

JAMES MITCHELL examined on oath. (No. 58.)

1. *The Chairman.*] You are a member of the Otago Education Board?—Yes, and have been for fourteen years. I reside at Oamaru, and have been largely concerned in the administration of primary education in North Otago. I am a member of the Waitaki High School Board of Governors, and I am also a member of the Oamaru Technical Board. The first point on which I desire to address the Commission is with regard to the method of the appointment of teachers. The experience I have gained leads me to the conclusion that the system we have at present in operation in Otago is as perfect as it is possible to get, always provided that it is used judiciously. The whole thing turns upon the manner in which the Board itself makes its first selection. If the Board acts wisely, and sends forward only names qualified for the position, then it does not matter what the action of the School Committee may be. I have read through the summarized report of the statement of the Chief Inspector at Auckland with reference to the system in vogue in that educational district, and I at once challenge that system as being based upon fundamental error. I do not believe it is possible to set out by figures the respective qualifications and merits of a large body of teachers. I have a copy of one of the reports upon it. The system that is in operation here enables us to consider not only the qualifications of the teacher, but his personal fitness for a particular position. In the system in operation in Auckland, and also in Wanganui, I believe, that element does not come into consideration at all. In Otago the personal element must come largely into consideration. We have had on occasions applications from teachers which we could not conscientiously send to districts, although the applicants had all the necessary qualifications. We have, by using the power we possess under the present system, succeeded in rehabilitating not only the schools but in re-establishing the teachers in their profession. That could not be done under an automatic system of promotion. Under the system we pursue, all the peculiar circumstances of a district, as well as the personal qualifications of a teacher are taken into account. We send forward names in accordance with the spirit of the Act, but we send forward the name of no candidate we are not prepared with confidence to appoint. I find that Mr. Israel very greatly underestimated the number of instances in which only one name was sent forward to a Committee. In twelve months fifty-five single names were sent forward, and in each of those instances the number of applicants ranged from two to sixteen. There were fourteen instances in Grade 2 schools, two in Grade 3, seventeen in Grade 4, and seven in Grade 5, and three in Grade 6. There were three instances in secondary assistantships in district high schools, and one for a mistress in a district high school. In a large number of these instances there was only one applicant who was really possessed of the necessary qualification. Many of the applicants were uncertificated altogether. In all the other cases the teacher whose name alone was sent on had not only outstanding claims by length or service or special qualifications, but was head and shoulders above the rest. Another thing that the Otago Education Board aims at is to keep the active co-operation of the School Committees. It will be found from the records that in Otago the average attendance is easily ahead of that for any other district in the Dominion, and also it will be found that in Otago a vastly greater amount of money has been provided locally for works in connection with the schools than is the case anywhere else in New Zealand. That, we claim, is a direct result of maintaining the active co-operation of the School Committees. It does not matter what sort of system of promotion or appointment is adopted, you will never have satisfaction in the profession so long as the salaries are based upon an unstable foundation. There must be grading of teachers, and every teacher must have a fixed salary with a fixed increment. The position is worse now than before in this regard, because we have the Superannuation Fund, under which superannuation is based upon the salary for the last three years of service. It may happen that that three years is not the best three years of salary for the teacher, owing to the teacher having to leave a school because of the grade of the school having been changed. Satisfaction never will be obtained in the teaching profession until every teacher is graded and every teacher has a personal salary, and not a salary dependent upon the position he occupies in any school. Another question I desire to speak on is the proposal to place the secondary, primary, and technical education under the control of the Board for the district. I have had fourteen years' experience on the Otago Education Board, and I have had a number of years' experience on High School Boards and Technical School Boards, and I say it would be a mistake. It would not effect any economy, and for this reason: These institutions would be controlled by men not resident in the district, and the expense of administration from travelling-expenses to attend meetings alone would be very great, whilst there is also this fear: that if primary and secondary education were put under one Board one or other class of schools would be sacrificed. I say you have got the greatest security of wise administration of the three separate branches of education by having them under three separate Boards, where the interests are not brought into conflict. Place the Waitaki Boys' High School under a Board sitting in Dunedin, and I venture to say that the interests of that school would be subordinated to the interests of the school close to the meeting-place of the Board. Then, in regard to high schools, it is not simply a matter of the schools themselves.

All the Boards have endowments, and the majority of these endowments are near the school itself. The members of the Boards have personal knowledge of these endowments, and they have opportunities of seeing whether or not the tenants occupying them are using them well. They have opportunities of knowing the value of all these endowments, and seeing that the highest reasonable rental is obtained from them. They have opportunities of managing these endowments that could not be enjoyed by a Board sitting in Dunedin composed of members drawn from all over the educational district. The same applies largely to the technical school. I say fearlessly that had the Dunedin Technical School been under the control of the Education Board it would never have obtained the degree of efficiency it has done under a local committee composed largely of men having a personal knowledge of a large part of the work to be done by that technical school. The present position of the Dunedin Technical School is due largely to the local knowledge and the local interest. Apart from these considerations, however, you are not going to effect economy by concentrating management under one Board. Under present conditions there are no travelling-expenses to be paid to members of the Technical Board, as they all live in the district, but once put it under the Education Board you will have several members on the Committee or board of management who have to come from long distances, and will receive 15s. per day travelling-expenses. Another thing is that having the three branches separated as at present the respective bodies are composed of men who are interested in that one branch. To get a body of men familiar with the whole of the necessities of the three separate branches of education would be a difficult matter. It would take a considerable time to educate a man to the requirements of a high school who had had no former association with such a school, but who might have a very familiar knowledge of the necessities of primary education. The position would be aggravated when technical schools have to be dealt with.

2. *Mr. Wells.*] Is it the experience of the Otago Board that the remuneration offered to the teaching profession is sufficient?—No. In almost every branch of the public service also it is possible for an officer to attain to a salary 60 to 100 per cent. higher than that open to a teacher.

3. *Mr. Kirk.*] Do you think it wise, in view of the time that must necessarily be spent in teaching fundamentals, that such things as shorthand and typewriting should form part of the curriculum in the secondary schools?—Yes.

4. Why?—Any system of education that does not take into consideration the vocation of the pupils is not a success. The high school should not be merely a school for literary attainment. It should not be devoted even in the greater part to entry to the University or the learned professions. Its curriculum should be so formed as to give the very best preparation for any vocation whatever.

5. Do you know any boys who have kept up their shorthand after they have left school?—So far as my experience of high schools goes, shorthand has not been taught.

6. In a district where there is a technical school and a secondary school, do you think that both should teach shorthand and typewriting?—I see no objection to it, for the reason that the conditions under which they enter the two schools differ very widely. A boy may be going to a high school for other reasons than getting a knowledge of shorthand and typewriting, and may take it as a branch of his education, omitting languages.

7. *The Chairman.*] Is it not a greater advantage to a lad going in for a commercial life to have a good knowledge of modern languages—for instance, German—in preference to a mechanical art like shorthand and typewriting?—I know that shorthand counts for a great deal in a commercial establishment and in a lawyer's office.

8. Among boys?—Among boys and girls.

9. *Mr. Poland.*] In connection with the fifty-five cases in which only one name was forwarded by the Board to School Committees, did the Board receive many protests and complaints from the Committees?—No. The Board has received complaints when only one name has been sent on. Yesterday a statement was made by one of my colleagues that a strong protest had been received from Lawrence. In two successive appointments the Board found in the list of applicants teachers of outstanding claims, and sent on one name only. The Lawrence Committee wrote concurring in the appointment, but entering a protest, and expressing the hope that the Board was not making it a principle to send on one name only. The Board replied that it was not making it a principle, but that in both instances the teachers whose names were sent on alone had outstanding claims. The Committee have been content with that. If the Board is prepared to give the facts, there is no Committee in the country who will not acquiesce.

10. *Mr. Davidson.*] If the Committee had such confidence in the Board that they would accept one name on the advice of the Board's Inspectors, would that not do away with the canvassing that is carried on?—If they were prepared to accept it as a general principle.

11. Do you think it is fair to the country teachers that applicants in and around the city should have the opportunity of canvassing for positions in the city and suburbs when candidates from the country had not that opportunity?—Of course, it is not fair; but how are you going to prevent it? I may say that so far as the Otago Education Board is concerned, although we have not reduced it to a regulation matter, we have adopted the principle of absolutely refusing to send on the name of a teacher who has not done country service for an appointment in the city.

12. A vacancy occurs on the staff of one of the suburban schools, and the Board sends on four names to the Committee: one of the applicants is, we will say, in Roxburgh, and the other three are in the immediate neighbourhood of the city: that applicant from Roxburgh or any other distant place has no opportunity of canvassing members of the Committee. Do you think it is fair that that candidate should be so handicapped?—No; of course, it is not fair, but how are you going to avoid the position unless you make it a penal offence to canvass?

13. If the Board, on the advice of its Inspectors, were to say that this candidate has the highest claims to the position, and send that one name to the Committee, giving the Committee the right to make any objections it saw fit, would that not be fairer to the whole of the teaching

service in this district?—It might, but I look at it from another point of view, which particularly applies to city appointments. You get for a position in the city anything from twenty-five to thirty-five applicants. Almost invariably in that number are several teachers whose claims are just about equal, and it would be a manifest injustice to select only one when four had a fairly equal right to the chance of promotion.

14. Do you not admit that the Inspectors and the Board are more capable of judging of the true claims of the several teachers for that position than any Committee?—I do think so.

15. Then, would it not be in the interests of education if the Board insisted on the rights they possess in law to make that selection, and send on that one name to the Committee?—I do not admit that it would be altogether the most satisfactory position. I do not myself admit that it would do the greatest amount of justice in many cases in regard to the teachers themselves, and I think that so long as you have Committees they should be allowed, at any rate, some voice in the matter of the appointment of teachers, always provided that you have more than one applicant who will equally well fill the position, and whose claims are collectively fairly equal.

16. Do the Committees, as a general rule, accept the applicant whose name is placed first in order of merit by the Board?—Yes.

17. Then, do you not think they would accept the choice of the Inspectors and the Board?—I think they would. I find the city School Committees generally take the second or third name on the list.

18. The point I want to make is the injustice done to teachers in out-of-the-way places who cannot personally canvass?—So far as the city and town schools are concerned, the selection of the Board for these positions is largely controlled by the length of service of the applicants in a country district. The Board will not give promotion to a teacher who has not done service in the country.

19. You condemn the system of computing salaries upon average attendances?—I do, most emphatically.

20. Can you suggest any other method?—Classification of the teachers, with individual salary.

21. *Mr. Hogben.*] If the Department were pressed to extend the new staffing under the Act of 1908 further than it it extended at present—namely, further than Grade 6A schools—would you see any objection?—The first objection that presents itself is that we have not at present the teachers at command. My opinion is that the abolition of pupil-teachers and the placing of certificated teachers in their positions is a change that can only be made by a gradual process. We have already all over the Dominion a deficiency of teachers. If you at once brought that part of the Act into full operation throughout the Dominion you would create a large number of appointments in the city and town schools, with the result that you would attract from your country schools the teachers who are already there, and so you would place a greater number of country schools in the hands of uncertificated teachers. You would be strengthening the city and town schools that are already doing good work at the cost of the country schools. I am satisfied it would injure the small country schools.

22. In 1910 there were twenty-eight teachers of Grade 10 salary, and these twenty-eight teachers were headmasters of Grade 10 schools: if the salary was a personal one, would you allow a teacher to hold a Grade 8 school with a Grade 10 salary?—Why not?

23. Then, you would increase the number of Grade 10 salaries?—Not necessarily, because a man might occupy a Grade 10 position and still not be drawing the whole salary. My contention is that you should grade all your teachers, and have them go up step by step. A teacher occupying at present a Grade 8 position might at once be promoted to a Grade 10 school, but I would not immediately give him a Grade 10 salary. It should come by a process of annual increments, until he reaches the maximum salary.

24. You might have any number of Grade 10 salaries?—You might ultimately, but it would take a great many years. The greatest dissatisfaction occurs in the lower salaries.

25. You do not think that would in time make a larger number of high salaries than the high positions were worth?—It might, but that would largely depend on your grading of teachers in the first instance.

26. *The Chairman.*] There are three schools in the Town of Oamaru—North, Middle, and South?—Yes.

27. And for some time there has been a falling attendance at the Middle School?—Yes.

28. Would it be possible to accommodate the children attending the Middle School at the North and South Schools?—So far as our standards are concerned, there would be ample accommodation, but you would require additional accommodation for the infants at both schools.

29. If the infants were taken into a kindergarten department and kept there till they were six or seven years of age, would that overcome the difficulty?—It might, but I doubt it. You are contemplating closing one of the schools, but that school building is not used solely for the purpose of a primary school. It contains the carpentry and cookery rooms for the whole of the Waitaki County.

30. The suggestion has been made that that Middle School should be used as a technical school: do you approve of that suggestion?—I do not know what advantage you are going to get from it, because there is already, I think, a sufficiently well equipped technical school in Oamaru, although it is not exactly as central as the middle school would be.

31. As to the relations between the Department and the Education Board with regard to new buildings and additions to buildings; when an addition to an existing school or a new school is recommended by the Board after inspection and report by members of the Board and by the Inspectors, do you think the Department should accept that as final?—Yes. I have always held the view that it is a serious reflection upon the Boards that an application for a grant for a new school made by the residents and supported by the Inspectors, and I may say in every case sup-

ported by members of the Board after visiting the site, should, before being granted, be submitted to a Crown Lands Ranger or any other officer.

32. The Education Board has appointed you a member of the Oamaru Technical School Board and of the Board of Governors of the Waitaki High School?—Yes.

33. Assuming that you retain these positions, and co-opted with men who took as much interest as yourself in technical and secondary education, do you not think you would have the benefit of all the local interests you now enjoy?—No. And there is another thing. I am not going to live for ever, and there is not the same guarantee that my successor will take the same amount of interest in education as myself.

34. Do you see any objection to the parents of the children attending the secondary schools having direct representation on the governing bodies of these schools?—No; I think it would be a great advantage to have it. There is a point I wish to refer to in regard to the lady teacher who has been mentioned. I have looked this matter up. This teacher is only one of three or four cases dealt with in precisely the same manner. In every case a request came from the Committee to have a male appointed in charge where the school rose a grade. The Board offered this lady a position equivalent to that she was asked to surrender, and carrying the same salary, and she declined. She was offered the position of sole teacher at Otakau School. The Board afterwards negotiated with the Caversham School for an appointment for this teacher there. She first accepted it, and then declined it, and accepted an appointment under the Southland Board. That appointment under the Southland Board she is about to relinquish, and she has made several appeals to the Otago Board to return to our service, and she has in writing frankly admitted that she made a mistake in the action she first took. The Board has determined to make an effort to find an equivalent position for this lady as early as possible.

35. *Mr. Poland.*] If a male had been in charge of that school when it rose from Grade 3 to Grade 4, would the Board have taken the same steps?—No.

36. *Mr. Pirani.*] Is it a rule of the Otago Board that no female shall be in charge of a Grade 4 school?—We have not made a rule of it, but we have made a practice of it. There is no instance where it has been permitted, and I do not think the Board will permit it. I think the policy being pursued by the Board is a correct one. I do not think it is desirable in a two-teacher school that both should be females. Such a school carries a salary up to £210, and that position, I say, ought to be filled by a male. We have to do this to prevent the positions passing from the hands of male into female teachers. Of the teachers passing from the training colleges, and necessarily costing the country a great deal of money for their training, the proportion of males who retire is very low, but the proportion of females who retire is very high. The consequence is that the larger the proportion of male teachers we retain in the service the lower the cost inevitably must be of preparing teachers through the training colleges.

37. Do you mean to say that the salary of this lady teacher would have risen in this position to £210 if she had remained?—Ultimately.

38. What is the salary she would have received if she had remained at that moment?—£180.

39. *The Chairman.*] Is there any other Education Board in New Zealand that adopts the same line of treatment in regard to lady teachers on the score of policy?—I am not aware of it.

LAVINIA KELSEY examined on oath. (No. 59.)

1. *The Chairman.*] You are president of the Dunedin Kindergarten Association?—Yes; I have been connected with it since its initiation, over twenty-one years ago. I am here as a representative of the Dunedin Free Kindergarten Association, to bring before your notice the value of kindergarten education. We as an association have been largely the pioneers of this movement in the Dominion, and we think the time has now come when the primary work of our public schools should be brought more into harmony with the latest developments of Froebel's teaching. We feel that this could be accomplished by the Education Department importing for each of its training colleges a thoroughly up-to-date kindergartner, who would give her services both to their college and to the trainees of our association. We believe that in the training colleges both in Melbourne and in Sydney kindergarten forms the basis of all the training, and all primary work is but a development of its influence. The Training College in Dunedin already opens some of its classes to our trainees, but the purely kindergarten training has still to remain in our hands, for there is an educative atmosphere about our kindergartens which we would like to see in every school. For this reason, we are glad that our work is in the hands of a committee of women, and we shall be sorry if the State ever takes our schools over as part of its machinery. The kindergarten alone recognizes the value of mothers' meetings, where the teacher meets the mother and the mother meets the teacher. We feel confident that in this we are but pioneers, and the interrelation of home and school will be an established factor in our land. As an association we could do far better work if we were allowed to keep the little ones till they are six years of age, and a better training could be given to our trainees if when certificated they could find work in a State school. We regret that many schools calling themselves kindergartens have little or nothing of the spirit of Froebel. An attractive name for a school is an easy way to gain pupils, but it is not for a name that we plead. We plead for that great education which springs from the self-activity of the child—the education which above all others gives that scientific training of thought, so necessary in life. We know that it is on these lines alone that the child's mind and soul can enter into its rightful possession of God's universe.

2. We have had our attention directed a good deal to the question of teaching sexual physiology in our public schools: do you approve of that?—Yes, if it is in the hands of the right person.

3. Do you think a single woman would be a right and proper person to select as a possible teacher?—Very few single women—one in a thousand may be. Certainly it would be far better done by one who has been a mother.

INVERCARGILL, THURSDAY, 20TH JUNE, 1912.

JOSEPH CROSBY SMITH examined on oath. (No. 60.)

1. *The Chairman.*] You are a member of the Southland Education Board, I understand?—Yes, I have been a member for a number of years. I have interested myself in the work of primary education for a great number of years. I have a statement which I will read to the Commission, as follows: Referring to the third article in your Commission's order of reference, I do not think that much further power could be wisely given to Education Boards while all the money is being derived from the consolidated revenue. There are, however, just two little matters that I may mention. First, Boards should be given funds to provide for conveyance allowance, and whether that conveyance is by vehicle or riding on horseback should be entirely at the discretion of the Education Board. How often are Education Boards informed by deputations that there is no one in the district who can be obtained to drive the children to school! I venture to say that there would be at least fifty fewer schools in the Dominion if parents were given an allowance for ponies. Second, Education Boards suffer great indignity at the hands of the Education Department by sending an officer of the Public Works Department or Lands Department to report on what he considers to be the best position to place a school, and this after the Board has probably sent one or two commissions of its own number to the district and considered the matter from every possible point of view, and who certainly know the whole bearings of the matter. There is just one other grievance I would refer to. I think the regulation of the Department which replaces two pupil-teachers by one assistant is suicidal. How are we to obtain a sufficient number of trained teachers in the future? This is just what has been happening in the various trades in the country. Too few apprentices have been allowed, with the result that tradesmen cannot now be obtained to meet the demands. With regard to School Committees, I would widen their scope by grouping them into areas of, say, five miles radius and allowing one Committee to govern all the schools in that area. This would have the advantage of creating more responsibility and increased interest, and have a tendency to obtain only enthusiastic members on the Committee. To obviate so very much going round with the hat I would increase their capitation by at least 1s. 6d., and ask them to attend to certain repairs which at present is thrown on to the Boards. I would further increase their interest and usefulness in education matters by giving them the option of appointing a small sub-committee to confer with the Board at the appointment of all teachers above the rank of pupil-teacher. The Committee could then, as well as the Board, often be made acquainted with information which is only in the possession of the Board. A national scheme of appointment, on a percentage basis, should be evolved, such as that now in use in Auckland, and which, so far as I can learn, approaches nearest to a scientific principle. Education Boards should absorb High School Boards of Governors. The two together could be worked much more economically, although, so far as the Southland High School Board is concerned, it would be difficult to make the secretarial and office expenses much lower, which only come to £100 per annum. It would be to the advantage of both primary and secondary education if the Inspectors of the primary schools were also the Inspectors of the secondary schools, which would have the advantage of acquainting them with any overlapping, and, on the other hand, showing the Inspectors the great gap which often exists between a Sixth Standard proficiency scholar and the starting-point of that scholar in the secondary school, and apply the remedy. I submit that the step from one to the other should be almost imperceptible. Technical instruction: In the expenditure on technical and manual instruction I consider there is a good deal of money wasted on subjects that are superfluous. For instance, much time is taken up with shorthand and typewriting. As these subjects lend very little to what one might call education, they might well be left to shorthand and typewriting schools. To be able to typewrite and use shorthand is no doubt a useful acquisition, but they are much more readily acquired a little later than the technical-school age. The same applies to the use of engineering machinery. These are most expensive tools to acquire. In the ordinary technical college only the theory of engineering and allied subjects should be taught, and then, on the production of certificates for mechanical drawing, geometrical drawing, applied mechanics and the physics of electricity, the student should only be required to serve an apprenticeship of not more than three years, instead of five, in some engineering workshop, after which he could again apply to his parent technical college for a complete engineer's certificate. The Government itself should set the example in this by insisting that all applicants for positions in the engineering departments of the Government workshops should possess such certificates from some technical college. If any student wished to go further than this and qualify himself for the highest possible position, he should then be granted a scholarship of a substantial character, to attend the Canterbury Engineering College, which has already obtained a status for efficiency equal to that of the Otago School of Mines. Technical day and evening classes should be controlled by Associated Boards, the membership being made up much as at present—constituted where Associated Boards are already in existence; but I would make a certain amount of the contributions compulsory on the part of Borough Councils and County Councils, and that all contributions should bear a Government subsidy of £2 to every £1 contributed otherwise. This I think would tend to economy and the adoption of such subjects only as were useful. Agriculture I would have taught only by experts in properly constituted agricultural colleges, each surrounded by 400 acres, which could be made largely self-supporting. The same conditions of entry as to other technical colleges should apply, including free travel. This plan would have the advantage of economy and thoroughness. I strongly believe that something should be done in the way of compulsory continuation schools. From 50 per cent. to 75 per cent. of the knowledge imparted in the primary schools is wasted, because it does not become assimilated in the mind of the boy or girl before he or she has to leave school. It is only after a lad reaches well into his teens that he begins to

consider what he would like to be in life, and to think of the opportunities he has lost or are still his to attain. If then he could have two or three more years school-life, much of the knowledge previously imparted would come to his assistance, and, by recapitulation, become so fixed in his mind that it would never leave him. Employers, however, will never submit to allowing boys to attend continuation classes during working-hours, as it would disorganize the whole staff. Parents generally are not unwilling that their boys should attend continuation schools, but they simply cannot afford it. They must get to work and assist in the household revenue. Grown-up boys require as much feeding and clothing as grown men. If boys have to learn a trade, employers prefer them not later than fifteen years of age. To overcome this difficulty, I would suggest that if a boy does two or three years extra schooling at an advanced technical school, the term of his apprenticeship should be shortened to four years, instead of five as at present. The increased knowledge and intelligence of that boy would more than recoup the employer for the loss of one year's apprenticeship, and the boy would be more valuable to the State for the rest of his natural life. You ask, if parents cannot afford to allow their boys to attend continuation schools, how would you provide for them? I would do it by a system of scholarships granted to every boy that passed the Sixth Standard, and whose parents were not in receipt of an income exceeding £160 a year. The interest we spend on a "Dreadnought" would more than provide these scholarships, and the Dominion would then have a valuable return to show for its money. This view of compulsory continuation education expresses my opinion, and answers those who talk about doing away with monetary town scholarships. Nature-study, if properly developed by the teacher, can be made of lifelong use. Where a teacher is enthusiastic on the subject the scholars rarely fail to be the same. Once develop the faculty in any one to see small things, he will not fail to see the large ones. Create a faculty of observation in a boy and he will be invaluable to whoever employs him. If our education system could create in its pupils three things—concentration, observation, and respect for the eleventh commandment, they have received the best education the world can give them. It is useless as yet to condemn nature-study as taught in New Zealand schools, for it has had no time to show its benefits in the grown-up citizen.

2. *Mr. Wells.*] What is the system with regard to promotions in this district?—We have the full list of applicants before us, with all the data as to age, whether married or single, service, and so on. Most of the names are, as a rule, known to us, but testimonials may be read if required. We go carefully through the list and make a selection. The Inspectors are present at the meetings, and furnish us with any additional information we may require. Invariably we act on the advice of the Inspectors.

3. Do you send in one name only for the vacancy?—We send four names: that is the usual practice.

4. Has that system led to canvassing?—Not much. For my own part, I like to see personally the candidates, because, although a man may have all the necessary teaching-ability, one has to judge from appearance and personality to some extent.

5. You quite recognize that the Inspectors really are the men who can best judge as to the abilities of teachers?—Decidedly so. They see them at work.

6. Do you think the Board would be prepared to adopt such a scheme as is in operation in Auckland, Wanganui, and Taranaki?—Yes, we have drawn up such a scheme of our own, which Inspector Hendry will submit to you when he comes before you. To my mind it is almost a perfect system.

7. Do you find any difficulty in filling positions in backblocks schools in this district?—Yes, there is great difficulty. In many cases recently there has been only one applicant.

8. Are many of the teachers in those schools uncertificated?—A great number of them are.

9. Do you think it would make country service more attractive if it were counted as extra service—say, two years in a backblock school to count as three in a town, or something of that kind?—I think something of that sort should be allowed. They are deserving of it.

10. In the case of candidates for promotion, if there is one teacher of outstanding ability on the list, is it the practice of the Board to send in one name only?—No; we invariably send four names.

11. Is the one at the top of the list of four usually chosen?—It is often the man at the bottom.

12. Then there is often injustice done?—Just so.

13. With regard to free books?—My opinion is that the money spent on free books is wasted, and that the books the children require to use at home should be their own property.

14. With regard to local contributions, would you give the local body power to levy a rate?—Yes, I think it would be necessary. I understand it would be subsidized by the Department. In the principal towns in New Zealand it would not amount to more than ½d. in the pound.

15. How many high schools have you in this district?—Two. The boys' and girls' high schools are separate schools, but under the same control.

16. Do you think there are many instances in which schools might be closed and the children conveyed to the centres?—I think there are very few in this district.

17. There must be a good deal of local opposition to the closing of schools?—Yes, but this Board, so far as my experience has gone, has been very careful about opening new schools. It has always been avoided where possible. If riding-allowance were given we could close a good many of the schools in this district—ten at least, I should think.

18. *Mr. Kirk.*] What allowance would you make?—I think the present vehicle allowance, if made for riding, would meet the case.

19. Would you provide the horses?—They would provide them themselves.

20. How are the poor people going to do it?—They can manage to scrape up a pony somehow. At present you cannot get people to drive them to school, and over and over again we have had applications for riding-allowance, and the parents are astonished when they cannot get it.

21. Have the parents got ponies?—I could not say, but if a man writes to the Board and says the parents want riding-allowance granted we assume they have something to take the children to school upon.

22. Are there not many who have no ponies and who have not the money wherewith to buy them?—Most of them have hacks, you know.

23. Assuming a school were closed on the understanding that riding-allowance would be granted, would you not be bombarded for grants for the supply of ponies?—I do not think so. I think they would be satisfied with the riding-allowance.

24. As a business man what have you to say with regard to the standard of education, judging from the boys who enter business firms after leaving school?—The writing is decidedly poor. Very few of the boys are fit to address envelopes. There is a good deal of grumbling amongst the tradespeople about it, and it has been mentioned by the Chamber of Commerce more than once. The spelling is not so bad, but composition is decidedly bad. My chief complaint is that they are not taught to add up long columns of figures. As a rule, by the time a boy gets half-way up a column he forgets where he is, and he is invariably wrong when he gets to the top. I think more time should be devoted to the practical side than to the problem side.

25. Are the boys being turned out with a capacity to reasonably use their brains?—I should say so, but the chief complaint is a want of concentration. I do not know what should be done to remedy it, as I am not an expert in teaching.

26. Might it not be that they are taken from one subject to another too quickly during the day?—I think there is a good deal in that.

27. You are an old teacher of shorthand, and speaking as such you are against the teaching of shorthand and typewriting in the public schools?—Yes.

28. Have you any remarks to make on the subject of home-work?—I am against home-work generally below the Third Standard. From the Third Standard I would allow a certain amount of home-work. And here I would like to remark that I have noticed that boys in the Third Standard are not as a rule bad writers. By the time they reach the Sixth Standard they are bad writers, and by the time they leave the high school they are worse still. This, I think, arises to some extent from the home lessons being written down on a blackboard and the students having to scribble them down as fast as possible in order to get their notes. Then they continue the same kind of scribbling at home.

29. With regard to this riding-allowance, again, which you suggest should be paid, do you not think there are numbers of parents who would not be able to purchase horses?—Of course, it is a difficult matter. I assume no Education Board would really close up a school until they saw their way to provide for the whole of the pupils. Of course, there might be poor farmers in the backblocks who could not afford a hack on which to send their children.

30. *Mr. Poland.*] You say you would provide a system of scholarships to be granted to boys who had passed the Sixth Standard whose parents are not in receipt of an income exceeding £160 a year: why do you suggest that limit?—I assume people with incomes below that could not afford to pay the fees for continuation classes. If they can afford to pay I think the children should simply have to go to the continuation school.

31. Is a man in receipt of £160 a year who has one child in a worse position than a man with an income of £200 who has four children?—There is a difficulty there, and for that reason I hesitated about making such a recommendation. I think, of course, that a man with four children gets more benefits from the State.

32. You think that those who can afford technical education and continuation classes should provide it for themselves?—Yes.

33. Would you apply that to primary education?—Not exactly.

34. With regard to rating, do you think it would be a fair thing that people in an outlying district in a county who can receive no practical benefit from technical education should be compelled to pay rates for the upkeep of that education?—Well, to some extent the same thing applies to primary education. People who have no children say, "Why should we have to pay?" We have to help one another.

35. You are of the opinion that the money expended on supplying free school-books is wasted: why do you think that?—Because fully 75 per cent. of the children will have nothing to do with the free books. They buy their own.

36. Do you mean to say that if the children were allowed to take the free books home they would not accept them?—That is a different question. I do not think there would be the same objection if they could take the books home just as they take the *School Journal*, for instance.

37. Can you make any suggestions to the Commission as to how the cost of education can be reduced without impairing its efficiency?—I have already made some suggestions in my opening remarks, although I have not laboured the matter. Take agriculture, for instance: I think that that being a special subject should be taught by a special man in a special place. That would increase the efficiency of the teaching, and though the cost might not be reduced in pounds shillings and pence, we should have better value for our money. It would also prevent overlapping.

38. Do you suggest it would reduce the cost at all?—I think so.

39. Do you know anything about district high schools?—No, except as a member of the Board. I think, however, the salaries of the district high school-teachers are too low. They are not high enough, I consider, in any of the secondary schools.

40. What about the salaries in the primary schools?—In the higher grades I do not think the pay is sufficient. In the lower grades, generally speaking, I think the pay is reasonable. I feel that if the teachers in the higher grades had applied their abilities to almost any other profession they would have been in receipt of very good salaries.

41. Do you not approve of the teaching of an agricultural course in the district high school?—No, I would have such a subject taught at a separate institution altogether.

42. *Mr. Pirani.*] Do you seriously say you would make the continuation classes compulsory, and make the pupils pay for the compulsory education?—I would make all pay who had over £160 a year income.

43. How would you find out the people who had £160 a year?—Just as we find out in regard to the National Scholarships.

44. That has been abolished, because the Boards could not find it out. Do you know any better system than that of finding it out?—No.

45. Do you not think that, as it was considered advisable to abolish it in connection with the National Scholarships, it is just as advisable to abolish your own idea of compulsory classes?—I do not know. I should like to see it tried.

46. Would you be in favour of making parents with an income of over £160 pay for the day attendance of their children at school for their ordinary education?—No, I would prefer to keep it as it is now.

47. You said there was some slight canvassing for positions by teachers, and that you would prefer to judge yourself by the personal appearance of the applicant: do you mean the personal appearance of a lady teacher?—It applies both ways.

48. Do you think that a man's ability, his capacity for teaching, his good record, should all be put on one side because you do not like his personal appearance?—Not necessarily. No wise Board would do that.

49. Do you not think it is an unfair thing to make a man's or woman's personal appearance a factor in promotion to a position he or she has justly earned?—You know well enough, putting it into every-day common-sense, that if you see a man you make certain impressions of your own as to whether he will suit you or not. If you see a man or woman come in slovenly in dress or appearance you form an unfavourable opinion, and I think that goes a long way when you are deciding what should be done. I apply the same principles in appointments by this Board that I do in my own business.

50. Have you any kindergartens in this district, apart from the primary schools?—Yes, but I do not know anything of their work.

51. Has the Board ever considered the question of supplying all school requisites instead of the Committees having to buy everything they want retail?—No; but we favour the money that is being spent on free school-books being spent in that direction.

52. Do you not think it would tend to economy if you got all your school requisites wholesale instead of purchasing everything retail, as at present?—Probably there would be a considerable saving.

53. In regard to the conveyance of pupils, do you know that the Department do pay an allowance to pupil-teachers for riding, either on a bicycle or horse?—No.

54. Do you think it would be a fair thing to extend that principle to pupils as well as to pupil-teachers?—I decidedly think so.

55. *Mr. Davidson.*] Do you know how many schools of the highest grade you have in this district?—No.

56. You would be surprised to learn you have only one?—Yes.

57. Do you know how many there are of the second-highest grade?—I think about three.

58. You will be surprised to learn, then, you have only one?—Yes.

59. You have only two schools of the third-highest grade in this district. Now, seeing that there is only one prize, if you can call it a prize, in this district, and knowing as I do that you have some of the most highly qualified teachers here to be found in New Zealand, what chance is there of these men getting into the highest positions in the teaching service?—Very little.

60. Then do you think that the lack of chance of promotion will tend to make the teaching service unpopular?—It does.

61. Do you think that men in the teaching service should have equal opportunities for promotion with those in other branches of the public service?—Yes, I do.

62. Do you think that a Dominion scheme of promotion would help to make the teaching service more popular?—I think it would be the best thing that could happen to the teaching service.

63. You would, then, strongly approve of establishing a Dominion scheme of promotion for the teaching service?—Yes, I think it is absolutely essential.

64. Have you considered the advisability of increasing the area over which certain Education Boards have jurisdiction?—I would not increase the area of this district, at any rate. I do not know about the others.

65. Do you know anything about the area of the Auckland Education District?—Yes, I know it is very large.

66. Do you think the Auckland Education District is too large?—No, I would not say it is too large; but, on the other hand, I would allow the Chairman of the Auckland Board—and this would apply to some of the other Boards—an honorarium, and then probably he would be able to devote more time to the executive work. A great deal of the correspondence that is now dealt with by the Board could be dealt with by the Chairman and Secretary.

67. You do not think the Auckland Education District would be too large under these conditions?—No.

68. You suggested that the same Inspectors could inspect and examine the secondary schools as well as the primary schools?—Yes.

69. Do you think it would be a wise thing to have the Inspectors placed under the central Department?—Perhaps it would. It would give uniformity to the various examinations in New Zealand, which there is not at the present time. So far as I can understand there is no standard in New Zealand for the guidance of Inspectors.

70. You think the placing of Inspectors under the Central Department would lead to greater uniformity and better co-ordination of the system of education?—I am sure it would.

71. You know, too, that the salaries of Inspectors vary a great deal in the different districts?—That is so.

72. Would not the placing of the inspectorate under the Central Department remove that evil?—Yes, it would.

73. Assuming that the education districts were reduced considerably in number and that the Inspectors were placed under the Central Department, do you think it would be a good thing to have in each district, as they have in some States in America, a Superintendent of Education, who would do the work you suggested should be done by the Chairman—who would be the eyes and ears of the Chairman, and be the connecting-link between the departmental officers and the Board?—I think the Secretary of each Board could do that instead.

74. Do you not think it would be better to have an educational expert to advise the Chairman of the Board on all matters educational?—No, I would not adopt that line.

75. Have you studied at all the systems in operation in some of the most advanced States in America?—I have done a little reading about American education, but not much.

76. You do not know, then, that in these States such an officer is almost invariably appointed to act as educational adviser to the Chairman of the Board?—No, I do not think that is necessary in New Zealand.

77. *Mr. Thomson.*] Do you know of any other way in which economy can be effected in the Southland Education District other than those you have mentioned?—I cannot think of any just now.

78. Do you think there has been any unwarranted expenditure in this district?—No. I think it has been the reverse of that.

79. Do you think there has been any waste either in buildings or materials?—I do not think so; our credit balance proves that generally.

80. *Mr. Hogben.*] Some of the work in secondary schools would include mathematics as high as that taken for the B.A. degree, fairly high science, Latin, Greek, French, and German, and pretty advanced English: would you choose as the Inspectors of primary schools only people who would be capable of examining in these things in the secondary schools?—No. I assume that if, as Mr. Davidson just now suggested, the Inspectors were centralized you would have Inspectors for the different subjects.

81. That really means you would have different men to inspect the secondary schools?—If the Inspectors were centralized in Wellington you would have Inspectors of different grades, and they would take the different grades of schools.

82. You said that employers would never agree to allow boys to attend classes during working-hours?—Yes.

83. Are you aware that a great many of the largest firms in Great Britain all allow time off to their apprentices to attend classes?—The difference is that in England they are allowed far more apprentices than we are here—they are allowed as many apprentices in England as they can put on. They have so many more boys than we have that they can afford to allow the boys time off to attend classes. If we did that we would have to shut down our business. The trouble here is that we cannot get boys.

84. You said in regard to handwriting that children ought to be taught the right kind of stroke at the same slope for a long time?—Yes.

85. Do you think that would be very interesting work for the children?—No, but it has to be done, and you would turn out efficient writers at the end of it.

86. Are you aware that in the period of growth from early childhood up to the age of fourteen or fifteen the proportion of the length of the fingers and arms all change considerably?—They may change.

87. They do change, and will that not affect the position of the slope of the hands and therefore the slope of the writing?—I do not think so.

88. You would have poverty scholarships?—I would not admit it as "poverty scholarships," for the same reason that we will not admit the word "workhouse" in New Zealand.

89. They are scholarships given on account of poverty?—No, not on account of poverty at all. Because a man cannot afford to pay for a thing does not necessarily mean that he is in poverty.

90. Are you aware of any system of poverty scholarships in existence anywhere that has succeeded in actual practice?—No; but it does not necessarily follow that because it has not succeeded that it should not succeed.

91. I will take the case of a clerk in a town who is in receipt of an income of £4 per week: you would not give his children a scholarship?—No.

92. Now, a farmer lives very largely on the produce of his own land, and his nominal income is £200 a year: how are you going to find out his actual income?—I do not know. The Government are trying to find these things out under the income regulations.

93. If it does not act fairly is it right in principle?—I do not see any other way to do it. We know for a fact that a good many parents cannot allow their children to continue at school when they reach seventeen years of age. They have to do some work.

94. But you would take the scholarship away from one who has a little more money?—We have to draw a line, and that is where I think we should draw it.

95. Do not the wealthy people pay under a proper system of taxation?—I do not know, I am sure.

96. Do you realize what it would cost to send all our agricultural students to special schools and colleges: do you know we should have to supply something like seven thousand or eight thousand agricultural workers a year to keep up the supply in New Zealand?—Yes.

97. And if we put from two hundred to two hundred and fifty pupils in each college that would mean establishing thirty-two colleges in New Zealand?—Yes.

98. That is for a one-year course. How much do you think it would cost to train each pupil a year?—About £8 to £10.

99. Would that keep him and provide instruction and laboratories?—He would go home every night.

100. Then, you would only give the instruction to the pupil who could travel there every day?—Yes.

101. What about the others who are away in the country?—They would have to do as they do now—if they cannot get to it they cannot get to it.

102. So you would not provide it for them where they live?—No.

103. But if there is another way to provide it would you consider it?—I do not think there is any other way to do it with the same efficiency.

104. *The Chairman.*] Why do you think compulsory continuation classes at night could not be made successful in a community like this?—I think compulsory evening classes would not be a success, from the fact that you could not drive a boy to do work at night after he has been working in the daytime.

105. We were told at Auckland that there was a marked desire on the part of those engaged in manufactures to allow boys to go into the technical school on part-time, and that the failure of the Arbitration Court to recognize that as part of the training is the only bar: have you any reason for doubting that statement?—I do not think the system would work in practice.

106. Mr. Hogben has already told you what is already very largely the custom in Great Britain, and if I assure you it is also a fact that in the United States the employers encourage their apprentices to go into the technical schools, is there any reason to think that the employers in New Zealand would not do the same?—Yes, I think there is.

107. And how is a boy to get the theoretical training that all authorities admit can only be got in a technical school?—I do not know. If a boy desires more information he will attend the evening classes, but I was referring to the lad driven to school against his will in the evening. I think you could not make any impression on him whatever.

108. You, as president of the local Chamber of Commerce, tell the Commission that the opinions you expressed to-day as to the weakness of the primary-school system are shared by your fellow-members very largely?—Decidedly so.

109. Seeing that this district is one that is largely dependent on agriculture for its welfare, do you not think the course of instruction given first in the primary school and then in the district high school should be carried on to its proper conclusion by means of higher agricultural institutions in this district?—Yes, and that is what I mean by the agricultural colleges. I think the school gardens are admirable things from the very fact that the pupils are allowed to make notes and watch the plants grow.

110. You have expressed a strong opinion as to the quantity of home lessons given to the children in the primary schools: is that your opinion as a parent?—Yes.

111. A gentleman in Dunedin says this: "As to the abuse of home lessons, I feel sure that is quite in accord with your broad-minded views. Children's brains have very little or no rest. They begin at 9 a.m. and leave off study at 9 p.m. at night. The strain is very bad indeed on young and growing children, especially girls. The parents practically do half or more of the teaching at nights which has been set out by the teacher for home lessons. This is a time when the most of fathers and mothers want a rest after their daily toil. If the syllabus was cut down to real sensible lines it would, as you well know, be better for all concerned. The children could then get a better grounding on more beneficial subjects which are so needful to their every-day life. The present system is driving, not teaching." Do you indorse that?—I indorse that entirely. That applies to the time when my boys were at school.

112. *Mr. Wells.*] How long ago is that?—Fifteen years ago.

113. *Mr. Thomson.*] Do you really think that the statements in that letter are in accordance with fact: do you think that that amount of home-work is going on in Southland?—I do not know that it is now.

114. *Mr. Davidson.*] What is your opinion as to the advantages or disadvantages of the establishing of the *School Journal*?—I think the *School Journal* is an exceedingly good thing, and my only complaint against it is that I think it should be a little larger. I think it is of considerable benefit in the home itself, and the children, so far as I see, are greatly interested in it.

115. *The Chairman.*] You spoke of the benefit arising from the fact of the Government recognizing the certificate granted by technical schools: would you carry that principle a stage further and say it would prove an encouragement to technical education if the Government were to give the foremost pupils in the schools preference of employment in its workshops and engineering shops?—I think so.

ANGUS MCNEILL examined on oath. (No. 61.)

1. *The Chairman.*] What is your position?—I am headmaster of the Bluff School. I have been in charge there for one year. I was in charge at Otautau for about twelve years, and at Colac Bay for eleven years. I am a Master of Arts of the New Zealand University.

2. Have you any statement to make in regard to the subject-matter of our Commission?—Yes. I wish first to refer to the question of education in the backblocks schools and in the sole-

teacher schools generally. This class of schools constitutes the largest group of schools in the Dominion, and is responsible for the education of a very large number of pupils. Sole-teacher schools always have presented, and always will present, special difficulties, for the reason that the sole teacher has to teach not only all the subjects, but also all the classes. Uncertificated and inexperienced teachers generally pass their term of probation in the smallest of these schools, as no certificated teachers can be got at the salaries offering. If these teachers "make good" they contrive in most cases to get away to a position in a larger school; if they fail they either drop out of the service or continue to be its special weakness. There is no quite satisfactory solution of the difficulty; even fixing a minimum salary of £150 for certificated teachers will not remove the special difficulties of the sole-teacher schools. The best of teachers could not make a shining success of a school of thirty-five pupils divided into seven classes, and the best teachers will always be unwilling to accept or remain in positions in which they know it is impossible to do work satisfactory to themselves, and in which they cannot prove their ability. The best policy seems to be to limit the number of sole-teacher schools. At a conference attended by over a hundred Southland teachers last June this question was discussed at length. It was the unanimous opinion of the meeting that, wherever possible, a trial should be made of conveying pupils to large central rural schools, instead of creating or maintaining a multitude of small inefficient schools. Such a system would only be an extension of a system now in existence. The Education Department pays a considerable sum (£2 per pupil per annum, I think) for the conveyance of pupils by rail. Such expenditure is incurred by regulation on the certificate of a teacher. I refer to the expenditure on free-school season tickets. From the point of view of the Education Department, therefore, the expenditure of a considerable sum for conveyance would not be a new departure. That the system can be carried out successfully, and that it is conducive to greater efficiency, is proved by the experience of Canada. A difficulty is apprehended by some in the opposition of parents to the long distances that the children will have to travel. But there are compensating advantages in addition to more efficient instruction. With covered conveyances the pupils can attend school every day without the discomfort of getting wet; they will be under supervision all the way to and from school, and they will not be away from home for an unreasonably long time, since the system would not be established in districts where the conditions make reasonable hours impossible. As regards compulsory attendance at a central rural school, there would be no difficulty, since the Act, as well as the ruling of Magistrates, has defined the compulsory distance as the distance the pupil would have to walk either to the school or to the railway or public conveyance provided. There is no doubt whatever that in so far as the number of sole-teacher schools can be reduced to that extent there will be an immediate and tangible improvement in the efficiency of the instruction. The centralization scheme, if adopted, will not, of course, abolish the evil of sole-teacher schools; but it will, we hope, materially reduce the number of pupils that must get their primary education in these schools. At the conference to which I have referred there was also a discussion on the difficulty of coping in these schools with all the subjects in the extensive and complex syllabus, and the opinion was expressed that the syllabus might with advantage be simplified. In my opinion an improvement in the quality of the work done in these schools (and, indeed, in all schools) might be expected if less were attempted, so that there would be time to teach the essentials thoroughly. The present syllabus enjoins methods of teaching, and prescribes matter that can reasonably be prescribed only under ideal conditions—*i.e.*, in schools in which each teacher has charge of only one class of about thirty pupils at one time. An example of the kind of matter I refer to is the astronomical and geological deductions prescribed under "Geography A." As to co-ordination as a means of reducing the number of subjects, it is not merely co-ordination but absorption of the new subjects that is required. Some so-called subjects of instruction should have no place in a primary-school syllabus, except in so far as they can be made subsidiary to what may be called the legitimate subjects of a primary course of education—that is, they are not subjects, but methods of teaching. Nature-study should be absorbed in geography and composition, handwork in drawing, &c., and physical measurements in arithmetic and geography. I wish, in the second place, to present my views on the Regulations for the Examination and Classification of Teachers. The regulations at present in force I shall refer to as the "old regulations" or the "present regulations," and the regulations issued on the 13th February, 1912, as the "new regulations" or the "1912 regulations." The Institute has from time to time recommended the amendment of the regulations. In particular, the Department has been urged (1) to allow the candidates for the D certificate to take the examination in sections, (2) to restore history to the list of compulsory subjects, and (3) to account a certificate in first aid and ambulance as partially satisfying the requirements in the subject of human physiology. The new regulations, while in some respects an improvement, must be considered unsatisfactory in the following respect: (1.) The division into sections is too unequal; too much is required in the first section. There are thirteen compulsory and two optional subjects. In the first section the candidate must take either thirteen compulsory subjects or nine compulsory and two optional subjects, leaving either two or four subjects for the second section. Such a division is not conducive to thoroughness. It is true that a candidate may obtain a partial pass in the first section by passing in nine subjects, the second section in such case being the remainder of the examination—that is, six subjects. If under these circumstances six subjects can constitute the second section, surely it would be much better to allow the candidate to concentrate his studies upon the nine most essential subjects for the first section, which will have a certain value, as being equivalent in some respects to a certificate of lower grade. The division of the D examination into sections was asked for with a view to giving the uncertificated teachers already in the service a fair opportunity of qualifying for a certificate. It is claimed that a fair division into sections will make for more thorough knowledge of the subjects of the examination, especially

in the case of candidates far away from centres where they get tuition. To such candidates it will be a hardship to qualify in algebra and geometry in the first section. Further, although a candidate electing to be examined in methods of teaching in the first section may be quite ignorant of some subjects, such as geography and history, if these are deferred to his second section, yet he is expected to know how to teach these subjects. I consider that the division of the D examination into sections will not be helpful to the candidate in guiding him as to the order in which he should study the subjects for his certificate. In my opinion the first section should require a thorough knowledge of the most essential subjects of the primary-school syllabus, together with a tolerable knowledge of the methods of teaching them; the second section should be the remainder of the examination, including a more advanced and comprehensive paper in methods of teaching. An uncertificated teacher who had passed in the first section of the D examination so divided could reasonably be intrusted with the sole charge of a small school for a year, and there would be a reasonable guarantee that he could do his work tolerably. Under the 1912 regulations, however, a teacher might pass a much stiffer examination to get his first section, and yet be quite ignorant of geography and history. (2.) The provision requiring a candidate to attend an approved course in ambulance and first aid is unreasonable, and will make it absolutely impossible for the majority of uncertificated teachers (who are employed in schools in the backblocks) to qualify for a certificate till they can get a position in a town school, while without a certificate their chance of getting such a position is practically nil. (3.) Similarly, it is unreasonable to require a candidate to produce a certificate to the effect that he has carried out satisfactorily a course of practical work in some elementary science. Scientific experts cannot be expected to turn up providentially in every out-back district to preside benevolently over the scientific experiments of the local candidate for the D examination; and such a certificate is unnecessary. A capable examiner can easily discover whether a candidate's knowledge is practical or merely book knowledge. Why, the examiner in human physiology almost annually complains that numbers of the candidates have never dissected a rabbit, and he relies upon the evidence of the written answers to his questions as proof of his confident assertion. (4.) There is no justification whatever for increasing the difficulty of the D examination by adding a subject. The old regulations require fourteen subjects, the new regulations fifteen. In this enumeration the three branches of drawing required under both sets of regulations are counted as three separate subjects. Two subjects have been taken from the optional and added to the compulsory list—*i.e.* (1) history, and (2) mathematics for men and needlework for women; having one optional subject if the present number of subjects were adhered to. But the new regulations require a pass in thirteen compulsory and two optional subjects. If the standard for the D certificate ought to be raised—and I do not say that it ought not to be raised—the proper course is not to require a superficial knowledge of an additional subject, but a more thorough knowledge of the essential subjects. I have, indeed, advocated a higher standard in English, and have suggested that one play of Shakespeare and one prose-work—say, an essay of Macaulay—be set for study, the candidate to show an appreciation of the thought-content. But of what value to a New Zealand teacher is a knowledge of Spanish, which he is invited to take as one of his optional subjects for the D certificate? And if his knowledge of Spanish is not up to the mark, is it reasonable to refuse him a certificate? Of course, it is desirable that teachers should have a knowledge of sciences and of languages, but that is provided for in the higher grade of certificates. The authorities that make appointments can discriminate, and if they do not, they must learn to discriminate between the grades of certificates. If a teacher is required who is practically qualified to teach a science, for example, one must be selected whose certificate implies such a qualification. Having pointed out some defects in the new regulations, I wish to refer in a general way to the conditions which render amendment in the directions suggested necessary. There is no hardship in requiring training-college students to comply with all the provisions of the new regulations before granting them a D certificate. Their goal is not the D examination. The principals of those institutions can be relied upon to see that their students do much more than comply with these conditions. But the training colleges have failed, and are destined to fail, to supply all the teachers required to staff at present salaries the backblocks schools. Although schools cannot be staffed in accordance with departmental ideals, schools must accompany settlement in its farthest outposts. There is no other class of public servants that have to penetrate so far into the wilderness as teachers. A teacher who goes out into the backblocks at a salary of £90, and who can teach the essential subjects satisfactorily, is of no small value to the State. Such a teacher is surely entitled to classification in the lowest class. The certificate is essential to him. Without it his tenure of office is at the pleasure of his employers; if his salary exceeds £90 it is subject to a 10-per-cent. reduction; he cannot become a contributor to or a beneficiary of the Superannuation Fund. Many uncertificated teachers at present in charge of small country schools are quite capable of qualifying themselves, by private study, for the D examination, if they are allowed to take it in sections and if unreasonable conditions are not imposed. There will always be a demand for teachers for such small schools, a demand that cannot be supplied by the training colleges. The Regulations for the Examination and Classification of Teachers must not ignore that very large class of teachers who enter the service by a side door. The new feature in the regulations for the teachers' C examination is the addition of a subject—*i.e.*, practical science. At least eighty hours have to be spent in practical work based on the syllabus for the science selected, and some branch of science is compulsory. The principle that the candidate must have an adequate practical as well as an adequate theoretical knowledge of the science is sound. Such knowledge is required in the University degree examination. It is also quite proper that in the teachers' examination there should be a stage at which a knowledge (theoretical and practical) of some one inductive science should be compulsory. This is the age of industrial science, and the man of culture must have a thorough

appreciation of scientific method if he would appreciate modern thought. He must have first-hand knowledge of the methods of probing the taciturnity of nature. The C certificate is understood to imply a degree of education roughly equivalent to the first section of the B.A. degree of the University of New Zealand. There is no obligation on the part of the University student to take a branch of science in his first section; he may do so, or he may defer it to his second section. To bring the Department's examinations into line with the University examinations some one branch of science should be compulsory either for the C examination or for the B examination, so that the candidate, if he found an opportunity of complying with the conditions, could pass in a science for C; if not, that he would be required to pass in a science before completing the B examination, which is understood to be equivalent to that for the B.A. degree. It is no hardship to require a training-college student to comply with the condition requiring eighty hours' practical work. But to make such a provision universally applicable would in practice limit the C certificate to those teachers who have the good fortune to be stationed in one of the University towns. A very large number of teachers neither have attended the training college nor have any prospect of obtaining a position in one of the four centres. Now, many of these are men and women of intellectual ability, and it is surely unjust to deny them any classification higher than D, even if by study they acquire a degree of education equal to that required for the first section of the B.A. degree. Such a regulation is a distinct discouragement to self-culture. It is the fashion in these utilitarian days to belittle the study of languages, of history, of deductive philosophy, of anything that does not make for the material advancement of the State. But the humanities are not, like the learning of the Chinese, an artificial or obsolete form of culture. They are still part and parcel of a liberal education, for they appeal to a side of the human mind whose needs are not satisfied by the generalizations of positive science, the imagination and the spiritual faculties. A student may acquire no small degree of culture, even if he confines his studies to languages and literature, to mathematics, history, and mental science. Moreover, quite apart from the obvious practical value that higher studies have for teachers, there is a special value in the study itself. Every student knows that when he is studying, it matters not what subject, his intellect is keener and all his wits are sharpened, and if he is a teacher his teaching is more effective. The new provision regarding the C examination is to be deprecated, since it quite unnecessarily withdraws from a very large section of the teachers a very powerful incentive to study—*i.e.*, the prospect of improving their classification.

3. *Mr. Wells.*] Do you know anything of the feeling of the settlers in this district with regard to the consolidation of schools in the backblocks?—No.

4. You know that usually there is strong opposition to the closing of schools?—Yes, by those living near to the school.

5. You think that could be overcome?—I think so. It is overcome in connection with other matters: for instance, the pupils are taken long distances to cookery and woodwork classes.

6. With regard to the examinations for teachers: first of all as to the D examination, would you approve the suggestion that that should be taken in three sections?—I have not looked into that aspect of it, but I do not at first sight think I should approve of it. I think two sections should be sufficient.

7. You recognize that the hygiene requirement is very desirable for teachers?—Yes.

8. Do you think it would be possible to allow teachers in the backblocks to leave the taking of their certificate in that subject until they had an opportunity of doing practical work in it in the town?—It would still leave them under serious disabilities. They would be liable to dismissal.

9. But if the regulations were altered?—If the disabilities accruing from the regulations were removed I do not think there would be any objection.

10. The teachers in the backblocks only look, I suppose, to the gaining of the higher certificate as a means by which they can gain removal?—Yes.

11. If the C certificate is made more difficult it will again tend to render backblock service more unpopular?—Yes, to a certain extent. Of course, teachers with the qualifications of a D certificate can get moved away from the backblocks, and so they do.

12. But, naturally, the man with a C certificate has an advantage over the man with only a D?—Yes.

13. Supposing the Department could see its way to have classes held outside the centres and country teachers could attend, would your objection vanish?—Yes, but I know that is impossible. Some of our teachers in the backblocks are a day's journey away from the railway.

14. Do you think it would be a fair thing to ask teachers in out-of-the-way districts to give up the whole of their Christmas holidays in one year to the doing of this practical work?—No, they could not afford it. Some of them have to go and work in order to augment their salary.

15. With regard to the term examinations that are now held in our primary schools, do you think three are too many?—No; the only thing I am opposed to is the large amount of clerking required.

16. Do you approve of the suggestion to bring teachers out from Home?—On the whole, I do not. One objection is this: that promotion is confined to the district in which the teacher happens to be employed, and it would be only fair if you imported teachers to inform them that they would have to stay in the district in which they happened to get their first position.

17. If it were possible to introduce a Dominion system of promotions that difficulty would vanish, would it not?—Yes. I do not think it is necessary to import any women teachers. The supply of men teachers is certainly limited, but there are sufficient women teachers for the positions.

18. Have you known of teachers who, when approaching the superannuation age and getting past their best work, continue to hang on to their positions?—I cannot say I have.

19. Suppose such a state of thing did exist, do you think it would be a good plan to allow a teacher to take a less onerous post without affecting his superannuation?—I suppose it would be reasonable.

20. What is your experience of the effect of manual work, such as woodwork and agriculture, in the schools?—It is equivalent to an additional subject, and it makes for the dissipation of energy. The return we get for expenditure on woodwork and agriculture is very small indeed. That does not, however, apply to cookery, because in that case they make no "bones" about their object, which is to train the pupils in cookery. In the case of the woodwork classes those in charge seem unwilling to admit that it is technical education straight out, and that they want to make carpenters and cabinetmakers of the boys. I am speaking of the primary schools, of course.

21. *The Chairman.*] Is not the object rather to give the boys a bent in that direction?—Perhaps so.

22. *Mr. Wells.*] Is it your experience that manual work has had the effect of raising the self-respect and confidence of those pupils who are dull and backward in the ordinary school-work?—No. There is so little of it for the time expended upon it that the effect would hardly be appreciable.

23. Are the teachers in woodwork here men who have been trained as teachers?—Yes.

24. They are local teachers who have had training in woodwork?—Yes.

25. They are not tradesmen in any case?—No.

26. *Mr. Kirk.*] Is much home-work being set the children in this district?—No, only about as much as would take about three-quarters of an hour at the outside in the evening.

27. Do you think that harmful to them?—No, I think it beneficial.

28. *Mr. Poland.*] Is manual instruction given in the school of which you are now the master?—Not in that school, but the pupils are sent once a week to Invercargill for a portion of the year to receive instruction.

29. Have you had any experience of a district high school at all?—No.

30. How much time do you devote to the teaching of agriculture?—No time.

31. *Mr. Thomson.*] You will admit, I suppose, that although a teacher may be uncertificated he may still be a good teacher?—Yes.

32. Are some of the uncertificated teachers in Southland doing very satisfactory work?—I believe some of them are.

33. With regard to the D examination, do you not think it would help uncertificated teachers to qualify earlier if they were permitted to take the examination in three or four sections? Why confine it to two?—I did not say I would confine it to two. I have not considered the question fully, but at the moment it appears to me there should not be more than two sections.

34. I understand in the first section there are thirteen subjects. How are a number of uncertificated teachers who have no opportunity of getting tuition going to pass the examination?—They can get some tuition by correspondence.

35. Not in practical science?—They could get theoretical knowledge, and they could carry out a good many experiments with the apparatus which should be obtained for their own school if properly equipped. I do not say they could go through the whole of the course prescribed, but they could do a considerable part of it.

36. What is your opinion of the present syllabus?—It is overloaded. There are too many subjects, and there is too much required in certain subjects. That makes for dissipation of the energy of both teacher and pupil and neglect of the essentials.

37. Is not the syllabus largely suggestive?—It is difficult to draw the line between what is suggestive and what is imperative in the syllabus.

38. What do you mean by "essentials"?—Reading, writing, arithmetic, spelling, composition, geography, history, and, say, drawing.

39. Does history embrace civics?—Yes.

40. Do you think it would be a wise policy to discontinue manual instruction in connection with the primary schools entirely?—No, because some of those subjects can be regarded as methods of teaching branches of what I regard as the essential subjects. Paper-work, for example, is useful in drawing, and brushwork is really a branch of drawing. Physical measurements is useful in teaching parts of arithmetic.

41. I understand you wish to omit certain subjects from the syllabus in order to get greater concentration on what you regard as the essentials?—That is so.

42. *Mr. Pirani.*] How many schools are there in this district?—I should say about one hundred and seventy.

43. Do you know in how many schools they take cookery and woodwork?—I do not.

44. The return shows that cookery is taught in thirteen and woodwork in fourteen. Is the standard of education in this district very much higher than in other districts?—I do not know.

45. Do you not think it ought to be, if your contention is correct that the absence of these classes in so many schools enables greater concentration?—We have possibly a greater proportion of sole-teacher schools in Southland than you have, say, in Wanganui. I do not know that that is the case.

46. Do you know the proportion?—No.

47. *Mr. Davidson.*] You spoke of the necessity for simplifying the syllabus in connection with the sole-teacher schools. Could not that simplification be brought about if the Inspector had power to approve of a simple scheme of work drawn up by the teacher?—I think so.

48. What distance is your school from Invercargill?—Seventeen miles.

49. At what time do your children leave home in order to travel to Invercargill for manual instruction?—At 11.45 a.m.

50. At what time do they arrive home?—The train gets back at 6 p.m. They arrive home at various times up to 6.30.

51. Have you had any objections from parents to that arrangement?—Yes, they object to their having so long a day. They object to their going away from their own school for primary instruction, and to train travelling in promiscuous company.

52. For twenty weeks your children are absent from their own school for a full half-day a week?—Yes.

53. You suggested that the subject of physical measurements should be taken as part of the ordinary work in the teaching of arithmetic?—Yes, and geography.

54. Do you, then, object to the present method of payment for that subject of capitation grant?—Yes, I do.

55. Do you think it adds considerably to the clerical work of the teachers and officials of the Education Board?—It adds to the clerical work of the teachers.

56. If it were necessary that some payment should be made for the teaching of physical measurements, in what form would you suggest it should be made?—The Education Board should receive a subsidy which should be utilized for paying for apparatus and material required.

57. What manual work do you take in your classes—Standard V?—Brushwork, and in Standard IV the same.

58. Do you think it necessary that payment should be made by capitation for that subject?—No, I think the material could be very well supplied in bulk by the Board.

59. Do you think that would tend to lessen the clerical work of the teacher and would make for economy?—Yes, I do not see that there would be any greater cost.

60. *Mr. Hogben.*] You believe in the teaching of French as an optional subject?—Yes.

61. Suppose a student comes here from another country—from a school where Spanish is taken—would you allow him to substitute Spanish for French as an optional subject if he wished?—No, I do not think so. What I was speaking about was the addition of another subject to the examination.

62. You would not thereby add to the compulsory subjects?—No.

63. With regard to science: suppose in connection with the D examination any teacher who had a school garden were allowed to take his children through an elementary course in agriculture and that were allowed to count as practical work, would that not overcome the difficulty considerably?—I suppose so.

64. Are you aware that is what is recognized already?—No. That would limit him to agriculture, would it not?

65. We are speaking of country teachers, so that a country teacher could qualify in one way by taking agriculture?—Yes.

66. Do you think any part of a science can be taught without taking practical work?—No, not really.

67. Then, what is the good of its being taught purely from a book?—I do not set any great store on the science work required for the D examination.

68. Do you think we might do without science in a teacher?—Not entirely, but in some schools he has really very little use for it.

69. You think a teacher might leave his children without training their observation at all?—No.

70. Can he train the observation otherwise than by scientific methods?—I do not suppose he could do it successfully, although one might train oneself.

71. Do you think the better way to do it would be to make provision, whatever it costs within reason, for those people to get that training under scientific methods?—If provision is made for it I have no objection whatever.

72. Is that not the solution rather than making the regulations easier?—Yes, if money could be expended in that way I would suggest that as a remedy.

73. You would eliminate agriculture and woodwork. Is it not important that we should train all the powers of the children at the ages at which they can be trained?—Yes.

74. If you cut out woodwork, what subject in the syllabus is there by which you can train the constructive powers at the ages of from twelve to fourteen?—I cannot say.

75. Does not woodwork train those powers and activities—the power of making things?—Could not those powers be better trained after the primary-school course is finished? I should think so myself.

76. I was referring to training between the ages of twelve and fourteen?—I think that too early.

77. *The Chairman.*] Having regard to the fact that such a large proportion of the children leave school before reaching the Sixth Standard, should we not make more useful citizens of them if they were more thoroughly grounded in what you regard as the primary subjects of education?—Yes, I think so.

ELLEN LUMSDEN BIRSS examined on oath. (No. 62.)

1. *The Chairman.*] What position do you hold?—I am a teacher in the Middle School, Invercargill. I have been engaged in teaching for twenty-nine years. I was previously a teacher in the Winton School, and before that I was a pupil-teacher.

2. Have you a statement to make?—Yes. As regards the position of women in large town schools the women teachers of the Dominion feel that they have a grievance, and for some years they have been unanimous in endeavouring to have it removed. It has been before institutes, has come up yearly at the annual conference, and though at first the sympathy of the majority of the male teachers was somewhat weak, yet at the last conference they practically unanimously carried the remit brought forward by the women teachers. The Commission which toured the Dominion some years ago removed the injustice suffered by women teachers in the country, when for doing exactly the same work they were paid at a lower rate, but at the same time, as the

result of their investigations, the Department did away with the position of mistress and gave the Education Boards power to appoint a female teacher first, second, or third assistant at their pleasure. In every large school there is a head teacher who organizes and controls the staff; there is an infant department in which are assembled usually from one-third to three-eighths of the total number of children on the school roll, and the rest of the school is divided into standards presided over by one assistant with, in some cases, a pupil-teacher to help, or probationer, according to the size of the standard. The teacher in charge of the infant department is always a woman, usually one of long experience, and no male teacher has been found brave enough to undertake this work. Women teach all standards from the First to the Sixth; we have women sole teachers of country schools, women in schools of Grade 4, and a woman in charge of Grade 6 school, whose reports are as good as those of any male teacher. In Taranaki we have a woman in charge of a school of over 300 doing excellent work. Thus, to a certain extent, male and female assistants have been proved equal in any grade of school. That so far women have not proved in New Zealand capable of controlling schools of 900 to 1,000 is simply because they have not had the chance. But in every large school there is a special place where women are required, and that is in the infant department—one of the most important departments of the school. Her work there is different to that of any other assistant; she has to show powers of organization not required by any other member except the head teacher: in a word, she is the head teacher of the younger children, and her helpers are young pupil-teachers of little experience, or junior assistants, or probationers. Every head teacher recognizes theoretically the value of the work done by the female in charge of this department, and the days, I trust, are gone by when it was thought that any one was fit to teach little ones. It is now believed that you cannot have too capable a person for this place. At a conference I attended a leading educationalist said, "We want the best head teacher possible for the school, and we want the best woman teacher for our infant department, and the school will do well." The proportion of women teachers to men teachers is very great, and if the best women are to be induced to enter the profession and to qualify for taking charge of an infant department you must offer them a fitting position as a reward. It should not be possible, as has happened in some districts, that women in control of large departments should see placed above them young men of a few years' experience (in some cases their own pupil-teacher) whose work is the teaching of a single standard. The majority of the Education Boards (with the exception of Auckland and Otago) rank the woman in charge of the infant department third in rank; the two last-named districts rank her fourth on the staff. From being next to the head teacher in those districts she was disrated to the fourth position. The work demanded of her is exactly the same as in former days: she still in nearly every case manages the infant department, trains pupil-teachers or probationers, takes the senior girls' sewing, is responsible for the sewing of the school, and is supposed to exercise control of the senior girls in the playground. Why the worth of their work has never been recognized is fairly easy of explanation. In the first place no head teacher or Inspector, or member of Education Board or School Committee, has ever done the work, so practically they are unable to value it. Only an intelligent company of mothers could assess it. In the second place, the majority of our female teachers in charge of this department say very little about their work: where there is little knowledge there is little sympathy, and, finding that their difficulties are only partially understood and greatly underrated, they keep silence. In these days, when the moral evil is in our midst and when at least half of the children attending our schools are girls, it is surely right that everything that will tend to raise the moral tone of a school should be sought for, and among these I do not place least the influence of its women teachers. Show by the position you place her in that you value so lightly the power that she exerts for righteousness and you cripple and destroy that power. The community and the children are as well aware as Education Boards of the value which is placed upon the services of its best and most faithful women teachers, and I sincerely hope that our weary struggle to obtain a just recognition of our services will be accomplished by means of this Commission, and that under a colonial scale of salaries women doing the same work in every part of the Dominion will receive equal rank and equal pay, and that as the result of your investigations you will be able to show that the women who manage large infant departments are both a commercial and a moral asset that Education Boards should be recommended to value more justly. As regards the subject of arithmetic in Standards I, II, and III, the majority of teachers of these standards feel that the work is unequally distributed, and that a better division could be obtained. In Standard I four simple rules are supposed to be taught, using only small numbers (the simple rules extending only up to the 6 table), and in addition problems. As a matter of fact, every teacher who works for the future does not confine the children to the small numbers demanded, and usually the First Standard is taken up to 12 table. Problems can be taught to Standard I, but the result is not worth the expenditure, and consequently quite a large proportion of head teachers refuse to ask problems from any standard below III, requiring the assistants rather to obtain mental accuracy by learning tables thoroughly and using them in fairly difficult sums. Standard II takes the four simple rules again applied to larger numbers, division up to 20, and the four compound rules, also problems. Unless the children are extremely well prepared in Standard I doing work beyond that required by the syllabus, the work of Standard II would be too heavy, and would take up too large a part of the school time. Standard III has a breathing-space to assimilate what has been learnt; nothing particularly new is asked from them, only more difficult work in the aforementioned rules, and, of course, problems. Those who have had experience in teaching arithmetic in the lower standards are convinced that written problems should not be required from Standards I and II, only mental ones; that these are the standards where tables should be thoroughly learnt and applied to large numbers to test the mental accuracy of the pupils. A child is not (at this stage) half as wearied working a fair-sized sum as it is in confronting a problem with its reason-

ing-powers so largely undeveloped. If the multiplication and addition tables up to 12 were taught in Standard I with corresponding sums (written problems dropped), subtraction and division in Standard II with the two former rules and long multiplication, and, of course, in both standards mental arithmetic and mental problems (easy), this would form a good foundation for the teaching of the compound rules in Standard III. Children in Standard III would thus have the pleasure of beginning entirely new work, and the other standards, relieved of an excessive burden, would show greater proficiency in mental accuracy. I think too little attention is paid to school hygiene. I think that at least once every year each school should be taken in charge by the Health Department and thoroughly disinfected. We usually wait till an epidemic comes and then the cleaning is begun. There should be an inspection of our school furniture, and if it is unsuitable it should be at once condemned and got rid of. The Education Board, to most prayers for better seating accommodation, has no funds; there must be money in the Treasury, or how can the large grants for manual work be obtained? Better than all the paper-folding, brushwork, and plasticine which is so freely given would be comfortable seats with backs to them where our little ones could sit in comfort. The older boys and girls in secondary schools have individual desks and easy seats; too many little ones in primary schools sit on narrow backless forms the whole day, because the Education Department has no funds, or because educational authorities have not realized the necessity of comfortable seats. Again, we have large infant-rooms, but none have class-rooms attached. Wherever a large infant-room is built a class-room is not a luxury (like brushwork, plasticine, or cardboard modelling) — it is a necessity, for unless it is provided much of the teaching has to be done in cold lobbies hung (in our climate) with dripping coats. These are three things that I think the Commission might recommend to the Department to be forwarded to all Education Boards: (1) Schools should be thoroughly disinfected every year; (2) comfortable seats with backs to them should be provided for at least every child of tender years; (3) new infant-rooms should have at least one class-room to which classes may be taken from the main room and taught. The great drawback to education in Southland has been the want of a teaching training-room or school of instruction. It is too early yet to feel much benefit from the students who have attended the Training College: in any case, they form but a small proportion of the whole. The only instruction for years that the majority of our young teachers has had has been in the infant-rooms or by aiding an assistant in a standard class, where their work was almost purely mechanical, and from this they have gone to take charge of country schools. A room in one of the large schools with a thoroughly competent instructor one would think could have been managed, but again want of funds proved a bar to progress. One would think that it was the duty of the Department to recognize that a large and important district the size of Southland, with its lack of training-school, must suffer in educational equipment; and that they recognize this is shown by the remarkable generosity with which training-classes have been organized for teaching brushwork, paper-folding, cardboard modelling, physical measurements, gardening, grafting, and pruning; and the only thing that would have been of incalculable value to the majority of untrained teachers, a school for teaching them the best methods of education (so that they might have learnt other than by their failures), this it has been impossible to obtian. After all, what is wanted is better training to prepare our young teachers for their work, and no matter what the cost it will be well spent. You cannot prepare a perfect syllabus, but you can make such arrangements that no teacher who has not graded in a school of instruction and given proof of capability to teach shall be given an appointment.

3. *Mr. Wells.*] With regard to this vexed question of the position held by ladies, you recognize that ladies already receive preferential treatment in that certain positions must be held by them: that is to say, that one of the first three positions must be held by a lady teacher?—You can hardly call that preferential treatment—giving one.

4. Surely it is earmarking one of the best positions in the school. That safeguard is not given to men?—I do not consider it preferential treatment. As you know, you say that certain positions must be filled by men: for instance, it is recognized that first assistants in all large schools must be men. Is it safeguarding our interests if you simply say the Education Boards must take a woman in the first three?

5. There is nothing in the law to prevent a lady from holding the position of first assistant?—Perhaps not in the law, but the Education Boards will not do it.

6. The Education Boards, and the School Committees also, in your experience, are anxious to do their utmost for the advancement of education in the districts?—Yes.

7. Then if men are appointed to the post of second assistant, is it not because it is really believed that the best interests of the schools are served by men being employed in such positions?—I think what is done is to a very large extent due to ignorance of the work of second assistants, male or female. In the large schools, if you give the position of second assistant to a man it is only a temporary position. He only holds it until he can get his degree, or as a stepping-stone to something else. When a woman takes it it is usually as a reward for her life's work.

8. Is it not a fact that the great majority of lady teachers who enter the service only remain until they get married? Do you know that 80 per cent. leave before they reach the retiring-age?—Yes, but then the remaining 20 per cent. have the greater right to be rewarded, have they not?

9. The majority of the men enter the profession as a life work?—Yes.

10. Do you know about the proportion of men and women offering for the service?—I understand it is about three women to one man.

11. Is it not as great as ten girls to one boy?—It might be. I cannot say.

12. Evidently, then, under the present conditions the teaching profession is not offering many inducements to boys?—Evidently it is not a congenial profession to men.

13. Do you think, then, it would be wise to take away from the men any of the positions open to them in the higher grades?—We just bring evidence to show that our work deserves a certain position, and then it is for you to decide.

14. What salary can a woman attain to at present under the Southland Board?—From £210 to £240: that is the largest.

15. What other callings are there open to women where they can obtain as much remuneration?—In large dressmaking establishments a woman can get £200 and over.

16. Is superannuation provided for her at the finish? What superannuation would a teacher retire with who enjoys that salary?—About £120 if she stays.

17. Can you think of any profession or calling in the Dominion in which a woman can get such a salary in addition to a superannuation allowance of £120 on her retirement?—I know of a confidential clerk in a mercantile firm who gets £200 a year and a bonus of £20 a year in addition. What is to prevent her from expending that £20 a year in insuring her life? We have to pay for superannuation out of our salary.

18. Do you not know it is subsidized by the Government?—The question is, Is the work worth what we are paid for it? That seems to me to be the main point. I hold that the more responsible positions should be thrown open to women teachers.

19. Do you not think positions carrying from £180 to £210 a year are good positions?—There are very few positions at that pay.

20. *Mr. Kirk.*] Granting that as between men and women there should be equal pay for equal work, is there any economic question that should be taken into consideration as affecting the employment of men and women?—There is always the question that men have wives and families to support, but as against that there are quite a number of women teachers who have relatives to support. Besides, you do not pay male teachers according to the size of their families. There are head teachers in Otago who have no families.

21. You admit it is necessary to provide a sufficient salary for a man to keep a wife and family?—Certainly, but not many second assistants are married men. As a rule, it is only used as a stepping-stone to some other position.

22. You consider schools should be fumigated once a year. Would it not be as well to fumigate them once a quarter?—Yes, but it seems rather drastic.

23. Do you approve of the boys and girls right through the primary schools being taught together in the same classes?—I should say, from eleven years onwards they should be separated.

24. *Mr. Poland.*] What is the highest salary paid to a woman under the Southland Board?—I believe there is one at £270, with residence.

25. *Mr. Pirani.*] Do you not think it would be a fair thing that the salary of a second assistant at least should be given to the infant-teacher?—That is what is done here.

26. And you are asking for further consideration than that?—I am here to plead the cause of the women in the other districts: that that should be made general.

27. Have you given any consideration to the system of classification of teachers as it is in force in other districts of New Zealand?—No.

28. Do you think it would be a fair thing that promotion of women teachers should be by a system in which service, ability, and educational standing should all be taken into consideration, and that it should not be at the whim of the School Committees and Education Boards?—Certainly.

29. What sort of desks are used in your school?—They are large desks—seven or eight in each.

30. You do not have single desks?—The educational authorities do not believe in them: they say they have been a failure in other districts. And there is also the want of funds. I brought the matter before the Inspector only the other day, and he said if I made a request for the single desks he would certainly refuse to recommend them. I thought, therefore, I had better bring it before the Commission.

31. Do you think it has anything to do with the accommodation in the schools?—I do not think so. There is a large infant school built here, and there are no single desks or anything like that.

32. Would you be in favour, if such a system of promotion as I have referred to were in force, of men being put into competition with women for the different positions according to their ability to do the work?—I certainly think so.

33. *Mr. Davidson.*] Do you object to open competition between the sexes under the present conditions?—Yes.

34. You also object to the safeguards provided by the Department as being insufficient?—Yes, they have proved so.

35. What is it exactly that the women ask as regards salary?—They ask that the salary allotted to the second assistant, or a salary equivalent to that, should be paid to the first woman on the staff.

36. Have you ever known in Southland of a case of a woman who has been in charge of a third-grade school being deprived of her position when the attendance at the school has increased to thirty-six, thus making it a fourth-grade school?—Not in Southland. As long as a woman does good work she is never superseded.

37. Have you ever known of such a case in any other district?—I understand there have been such cases in Otago and Canterbury.

38. Have you any suggestion to offer for remedying that evil?—Only by a recommendation from the Commission that as long as a woman is doing good work in a school, if the school is raised to a higher grade, she should not be deprived of her position.

39. Suppose the school rises to a Grade 5 or 6 school, do you think the same principle should apply?—Yes.

40. Suppose it rose to Grade 8, would you still retain a woman at the head of the school?—If she had worked it up to that I should be very sorry to see her disrated.

41. Would you deprive the Education Board of the right to transfer a woman who in their opinion was unable to perform the duties of head of a Grade 8 school?—Certainly not. The Board should have the right to transfer any teacher whom they consider incompetent, but the incompetency must be proved.

42. *Mr. Hogben.*] I understand it is possible that one of the reasons why you do not have single desks in your schools is that there is not sufficient floor-space?—No. We had an educational authority from Sydney, and he said that the single desks would occupy no more room.

43. If you could not get single desks, would you be satisfied with double desks?—Yes, anything that would be comfortable for the children to sit in.

44. Are you aware that the double desk is the most economical of floor-space?—Yes.

45. *The Chairman.*] I understand the position you take up is not exactly that which Mr. Davidson took. Do you think that a teacher, so long as she conducts her class and fulfils her duties to the satisfaction of the Inspectors, should be continued in that position?—I certainly see no reason why she should not.

46. Would it surprise you to know that woman in certain employments—in dressmaking, for instance—earn as much as from £400 to £500 a year in the large establishments?—I know that.

47. Have you any acquaintance with kindergarten instruction?—Yes, the lower room in our school is a kindergarten.

48. Would you approve of a kindergarten class being attached to the primary-school course?—I think it would be very nice if the children came from four to six years of age.

49. Would it not be more advantageous to keep them in the kindergarten department of the primary schools from four to six, and then pass them into the standards?—There must be kindergarten methods.

50. Would it satisfy you if paragraph (3) of the Second Schedule of the Act of 1908 were altered to read "one of the first two assistants," instead of "one of the first three assistants," shall be a woman?—Yes, that would give satisfaction. That is what we have been asking for.

JOSEPH HUNTER examined on oath. (No. 63.)

1. *The Chairman.*]. What is your position?—I am principal of the Gore High School. I am a Master of Arts of the New Zealand University. I entered the service of the Otago Education Board as a pupil-teacher eighteen years ago, and went through the Training College course. I have been a teacher under the Otago Education Board, the Waitaki High School Board, and the Taranaki Education Board.

2. Do you wish to make any statement in regard to the subject-matter of our Commission?—Yes. I wish first to refer to the training of secondary-school teachers. Speaking generally, I am of opinion that teachers in secondary schools should show evidence of having received some teacher-training. Still, I believe that a teacher's personality and disposition count for far more than any training he may receive. Some may go through a complete course of training and yet be comparative failures as teachers. On the other hand, I have known university graduates entering into secondary work without any training and proving eminently successful. Still, teacher-training is a splendid preparation for secondary as well as primary work. I am of opinion that the teachers of the lowest forms of secondary schools should have had not only training, but also some experience as primary-school teachers. Pupils entering the secondary school generally find a great difference from what they have been used to in the primary school. So many new subjects confront them, the methods of teaching are necessarily somewhat different, they have all of a sudden to rely so much more upon their own efforts, that they are bewildered and often acquire a hearty dislike for their work. Now, a teacher with primary-school experience can make the transition from primary to secondary school methods more gradual. He understands the capacity of the pupils with whom he is called to deal, and finds his training in primary work an immense advantage. The pupils also reap the benefit. Primary-school experience also furnishes an admirable training in the art of keeping discipline and control. In my opinion, the syllabus is a good one. I think, however, that a good deal of the mathematical geography could be deleted, and the time spent in furnishing a better knowledge of political geography. I am met with great ignorance of even important centres in the commercial world. A knowledge of the geography of the world as it teaches man in commerce, manufacture, travel, and international interests is of vast importance, but is largely neglected. The mathematical geography could well be left for the secondary schools. I find also a want of accuracy in arithmetic and English composition. Pupils can express themselves freely enough, but they seem to have supreme contempt for such trifling details as correct spelling, punctuation, and observance of the simple rules of grammar. There should be more time for the teaching of history and civics. I consider that, seeing that all our secondary schools are now under the control of the Education Department, giving uniformity of control, there should also be uniformity in the matter of finance. Some schools can command a very much larger income than others, with the result that these latter cannot hope to compete with them in the way of school buildings, equipment, and staff. The number of pupils on the roll may be the same, and yet the facilities for progress are much greater in one school than in another. This, in my opinion, is unfair. I do not propose that there should be a redistribution of endowments, nor that the revenue from these endowments should be vested in the central Department for distribution among the various secondary schools. I am in favour of permitting the more-favoured schools to retain their present advantages. But there should be a levelling up. The less-favoured schools should receive help direct from the Department to enable them to take their place fairly with the other schools. They have to compete with them without handicap. Then it is only fair that all should start with the same advan-

tages. I am in favour of reducing the number of education districts in the Dominion. I think thirteen too many. Still, I am inclined to view with disfavour the proposal to place the control of primary, secondary, and technical education in the hands of the one Board. I would abolish School Committees, and in their place appoint bodies of men, call them "School Boards," if you will, to control all the schools in their districts. For example, all the schools in Invercargill, being uniform in nature, and similar in that they contain pupils working under the same conditions, could be grouped together and placed under the control of a town School Board—such Board, of course, to be under the jurisdiction of the controlling body of the larger education district and of the central Department. Then, another School Board could be set up, say, at Queenstown, to control all the small schools of the Lakes District, and so on. I believe that the establishment of such School Boards would make it possible to avoid the existing evils of control by Committees—very evident, especially in our country districts—and at the same time would provide for local control, which I think is a very necessary and desirable condition. I would favour the proposal to centralize the inspectorate, and thus pave the way for a Dominion scheme of promotion for teachers.

3. *Mr. Wells.*] Can you give us any idea of the length of the training you would recommend for secondary-school teachers?—I consider that a secondary-school teacher should have as much training as a primary teacher. The training could be specialized to deal with the work the teacher is going to cope with in the secondary schools. It might be a very good idea to have a training college solely for the training of secondary-school teachers.

4. You do not think that training could be undertaken at the existing training colleges?—Not as fully as it might be, because they train there essentially for the primary-school work.

5. Do you think one training college would be sufficient for the Dominion?—Yes, for present needs.

6. Can you make any comparison of the boys you are getting now from the Sixth Standard with those of some ten years ago?—I was a primary-school teacher myself until three years ago, so I am not in a position to make the comparison.

7. You spoke of reducing the number of Education Boards: have you thought at all as to the number there might be?—I think that the Dominion, if it is to be divided up at all, could well be divided into four districts—two for the North Island and two for the South Island; but I would leave the local control in the hands of the local men. For example, in the case of my own school, I would object very much to see the control taken from the local Board of Governors.

8. Do you think if the Dominion were divided into four districts there would be fairer facilities for the promotion of teachers?—Yes, and it would be still fairer if all promotions were made from the central Department.

9. Do you mean on a Dominion grading scheme?—Yes; I mentioned I was in favour of the inspectorate being centralized.

10. I take it your idea is that if the Dominion is divided into four education districts, and if the Chief Inspectors from these districts could come into close touch with one another, it would be possible to arrive at a uniform system of grading of teachers in these four districts?—That is my idea.

11. Do you think there is any tendency to overdo examinations in our schools?—I am a believer in examinations, not as an end but as a means to an end. I believe they are absolutely necessary in order to test not only the work of the children, but the work of the teachers. I would do away with the scholarship examinations, and devote the money given to scholarships to provide boarding-allowances for children coming in from the country.

12. Would you make the town pupils any allowance to cover the cost of their books in the event of doing away with the scholarships?—Yes, I think that would be only fair, as that would put them on the same footing as the country pupils.

13. Do you think that the work of the technical day school and the work of the high school might be taken together in the smaller towns?—Most certainly. I do not think there is any need for the two schools in the small towns.

14. You think that would make for increased efficiency?—Yes.

15. What would you consider a small town?—Five thousand people.

16. What is your opinion as to the value of the manual work in our schools, referring more particularly to the woodwork and cookery?—So far as cookery is concerned, I do not think there is a more admirable training for girls. I think every boy ought to have a knowledge of the use of tools. I believe a great deal of our woodwork, though, is lost time.

17. Why?—Because quite a number of boys never get beyond the stage of making shavings.

18. Is that your experience?—Yes. If there was some means of just confining the boys who show an aptitude for the work to this work, then the money would be well spent.

19. You do not think they get a valuable training in habits of exactitude?—Certainly they do.

20. Do you think that woodwork would give them that training more perhaps than any other subject in the schools?—Woodwork associated with drawing, yes.

21. That is an important point?—Yes.

22. *Mr. Kirk.*] Is there time for the teaching of such subjects as shorthand and typewriting in the secondary schools?—In schools such as mine there is a demand for it, and in the absence of a technical school we have to give it. We can usually make two courses. I eliminate Latin and possibly French, although I compel my commercial class to take French.

23. Do I understand that that can only be done at a sacrifice of other subjects in the general course?—I would not say that, because boys going in for a commercial course do not want the other subject.

24. What have you to say on the question of home-work?—Speaking from the point of view of a secondary-school teacher, I say that home-work is absolutely necessary, and it also has the effect of making the boys and girls more self-dependent, and it also keeps them off the streets at night.

25. And as to the primary schools?—I think very little should be indulged in. I think if the boys and girls in the primary schools carry out efficiently five hours' work a day they have done quite enough.

26. *Mr. Poland.*] You do not approve of the primary-school children putting in their spare time on the streets or at picture-shows?—No, I would rather give them home-work.

27. Have you an agricultural course at your school?—I am sorry to say we have not. I attempted to start one this year. We had a course completely drawn up, and to my chagrin only three came forward to take it, and ours is an agricultural district.

28. But you do intend to persevere with it?—Yes.

29. You referred to the evils of control by School Committees which are so manifest: what evils did you refer to?—Generally, in small country places there is one man who is the authority—educational and otherwise—in that place. You send a young lady as sole teacher to that place, and if she does not hit it off with that man her life is made somewhat of a misery, and I think in a case of that sort it would be a godsend to the teacher at least to have no Committee at all. I am not referring to the town Committees, because usually on the town Committees you have men of sense and business acumen.

30. What control does a School Committee exercise over a teacher?—It has no absolute control, yet in the social life of the teacher in that place things can be made so warm.

31. That depends on the class of teacher selected?—Yes, and the great danger is that you get a very inferior class in the small country places.

32. You referred to the want of uniformity in regard to the finance of secondary schools—in what particular direction?—Such schools as mine are wholly dependent on the capitation earned from free-place pupils attending the school. Other schools are liberally endowed, and though they may have the same roll number as I have, yet they have far more money at their disposal for school-equipment and payment of staff, and so on. They can afford to give more liberal salaries, and then if we do not get as good men we cannot cope with them.

33. *Mr. Pirani.*] How many pupils have you?—150; and our capitation is £12 10s. per pupil. I suppose my average for the year would work out between 135 and 140, because we always have boys drifting off to jobs.

34. Say you receive £1,600: ought that not to provide salaries on a fairly liberal scale?—Yes, if we could use it all for salaries; but at Gore quite a large sum is used for equipping the school.

35. Is any sum worth mentioning raised voluntarily outside the free-place money?—I understand £120 has been raised.

36. With the subsidy that will make £240?—Yes.

37. Do you think it would be a reasonable thing to levy special taxation or special contributions on the local bodies to assist the high schools?—No, I do not think so. I think education is a national concern, and therefore the expenditure should be borne by the national exchequer.

38. Do you not think that education is more an individual concern that a national concern—that the parent and the child are more concerned in getting a good education than the State is in them being educated?—I doubt that. I think children, far from wanting education, have to be forced to have it.

39. Do you not think that in many cases we are forcing education on children who would be better doing something else?—True, but where are we to draw the line?

40. Do you not think it would be a proper thing, where you have a purely scholastic course in a school, that a higher percentage of marks should be asked for from the pupils as a qualification for the free place?—There, again, we are cutting into an advantage of a free education.

41. Do you think it is an advantage for a child that shows no special aptitude to advance further with a scholastic education to spend two years at a high school?—Not in a scholastic course.

42. Then, do you not think it would be much better if the high schools and the technical schools were amalgamated, and some further attempt were made to discover the aptitude of the pupils for the course they were to be given in the secondary school?—Yes. Only we have to meet this problem, that quite a number of our ablest men have not shown any great aptitude at school.

43. Probably if they had remained at school they never would have been able?—But they might have been more efficient if they had received the benefit of a secondary education.

44. Take, for instance, matriculation: do you not think that before a candidate should be allowed to go to your school and take the matriculation course he should on leaving the Sixth Standard show some greater qualification than the ordinary proficiency pass?—Yes.

45. How long would it take the average student who had an ordinary proficiency pass to matriculate?—Four years.

46. Then, do you think it is a proper thing for the State to pay for the tuition of a pupil for twelve months or two years only, and then have the child taken away by the parents?—I believe a good deal of money is wasted by pupils not taking full advantage of the opportunities given to them.

47. Do you think something further might be done in showing parents the advantage of their children taking a vocational course instead of a scholastic course?—I think parents ought always to be interviewed when the pupils are enrolled as to the course they are to take. I make a point of that, and I was bitterly disappointed to find that only three parents offered to take the rural course.

48. If it was made more difficult for a pupil to take a course he is not fitted for, do you not think there would be more chance of his being directed to the course he is fitted for?—Possibly they would not take any course. I think they would go away altogether.

49. In regard to compulsory continuation classes in the evenings for boys and in the afternoons for girls, do you think it is advisable to introduce that system in your district?—Yes. We have a good number attending the continuation classes now. Quite a number of the lads have proficiency certificates, but they have not had an opportunity to go to a secondary school. I would be greatly in favour of exercising the compulsory clauses of the Act in my district.

50. *Mr. Thomson.*] You said you believed in a central inspectorate: would you state your objection to the present system?—My only idea for the centralization of the inspectorate is to get a Dominion scheme of promotion for teachers. At the present time a teacher in a small district has very little chance of getting out of that district into a larger district by promotion, and I maintain that if the inspectorate were centralized and the Inspectors were sent not to one district, but to districts in turn, then the teachers' qualifications would have to be brought under review with regard to the positions throughout the whole Dominion, and not in his own district only.

51. Do you think if there was a frequent change of Inspectors throughout the various districts in New Zealand that the Inspectors would get that close sympathy which grows up between an Inspector and teacher under the present system?—They would lose that, certainly. But as I said before, my only object in centralizing the inspectorate is to provide for a Dominion scheme of promotion of teachers, and at the present time I cannot see how we are going to do it unless by the method I have suggested.

52. Are you aware that in connection with the scheme in operation in New South Wales, under which promotions are made, political influence is brought to bear?—I am not. I do not see why it should be.

53. And you think by centralizing the inspectorate you would be able to get a Dominion scheme for the promotion of teachers?—Yes.

54. *Mr. Davidson.*] Do you not think such a scheme would also lead to a uniform interpretation of the syllabus?—Yes.

55. And would lead to a true nationalization of our system?—Yes, it would place the national system on a uniform basis.

56. Have you read or studied the latest scheme of promotion in Victoria?—No.

57. You spoke about the necessity of training the school-teachers in the methods of treatment of the various subjects dealt with in our training colleges. Do you not think the same methods of treatment should apply to the teaching of subjects in the secondary schools?—To a certain extent, but there they are dealing with a different class of pupil. When they are training in the primary-school subjects they are training to teach children from four to twelve or thirteen years of age. In the secondary schools they have to deal with lads of from fourteen to nineteen years of age, and that makes a great difference.

58. Does not that difference relate more to the methods of discipline and control?—In the secondary schools we can allow more for the individuality of the pupil than in the primary schools, and therefore the methods of teaching do not require to be so intense as in the primary schools.

59. Take the subject of English: would not the best methods of treatment of that subject in, say, the Fifth and Sixth Standards apply equally to the secondary school?—Yes, certainly.

60. Then, given a trained teacher who has distinguished himself in the method in our training colleges, and who also has considerable literary attainment, do you not think that teacher should have an opportunity of entering our secondary schools?—Most certainly.

61. Do you think it would be a good thing if the same controlling body had under its charge the primary and secondary schools within a district?—I am not averse to that so long as you do not do away with local control.

62. Have you ever considered the desirability of consolidating many of our unnecessary small country schools?—I think we could very well dispense with a great number of our small country schools and bring them together into a more fully equipped and staffed central school. The difficulty, of course, is the question of conveyance. Conveyance of boys and girls by train I do not consider an ideal method of going to school.

63. Under proper supervision would that not be much better than having the children taught inefficiently at a small school?—I am not sufficiently conversant with the localities so far as the primary schools are concerned to answer that question.

64. *Mr. Hogben.*] As to the training for secondary teachers, do you not think it is equally desirable that secondary teachers should make some study of child-life by observation of children from the early stages?—Most certainly.

65. Would not that observation of young children be well taken in the normal school attached to the training college?—Yes.

66. Then should not they study the same history of education as the other teachers study?—Yes.

67. Is there anything else left really for them to do but to get the special practice and the special observation of secondary-school methods?—Yes, they want to be able to get an insight into the method of teaching those subjects which are given in the secondary schools.

68. Suppose they took the ordinary course that a primary-school teacher takes at the training college, do you think we could avoid the question of special training colleges for secondary teachers by picking out good teachers in secondary subjects and allowing our trainees to go and see them teach?—That is, to give them access to our secondary schools: yes, that would meet the difficulty.

69. *The Chairman.*] Seeing that 40 per cent. of our children never pass through the Sixth Standard, and nearly 20 per cent. never reach the Fourth, is it not very necessary that the essentials of primary education should be taught to that large number who go out of the schools?—Yes.

70. Would you regard shorthand and typewriting as mechanical arts to a large extent?—Yes.

71. Seeing that your school is situated in one of the richest agricultural districts of New Zealand, would not the tendency of teaching those subjects necessarily be to increase the number of clerks, and will they not naturally gravitate to the towns?—Yes; but as there is a great demand for shorthand and book-keeping we must cater for that demand.

JAMES HENDRY examined on oath. (No. 64.)

1. *The Chairman.*] What is your position?—I am Chief Inspector under the Southland Education Board, and I have held that position for twenty-five years and a half. Before that I was teaching for ten years and a half under the Otago Education Board, and for two years I was in the Dunedin High School.

2. Have you any statement to make in regard to the subject-matter of our Commission?—Yes. I desire in the first place to invite the Commission's attention to a matter which for some time past has been causing my Board such grave concern that it has recently proposed a somewhat heroic measure for dealing with it—I refer to the insufficiency of the supply of teachers for the more poorly paid positions in the gift of the Board, and especially for positions in remote country districts. Month after month advertisements inviting applications for such posts have failed to elicit response from suitable candidates, until it has now become abundantly apparent that the prospects of teaching in the backblocks have no attractions for young people whose ability is more than moderate. And it is not altogether the small remuneration that is responsible for this condition, since positions in urban and semi-urban schools carrying the same salary are fairly eagerly sought for. The true explanation, to my mind, is to be found in the conditions of life in a backblocks school. The position is undoubtedly one of considerable hardship and difficulty, it seriously restricts social intercourse of an elevating character, while it throws the teacher—almost necessarily very young and very inexperienced—on his own resources in dealing with the difficulties incidental to his work. In short, it presents problems and conditions to which the assistant teacher drawing an equal salary is an entire stranger. Not only has the latter the great advantage of a more congenial environment, but also he is under the supervision of a competent head teacher whose counsel, help, and protection are always available. It is doubtless impossible to render the conditions of the unaided teacher in a remote country school ideally attractive, but I am convinced that until such positions carry salaries adequate to the work and circumstances, the difficulty which Boards are finding in satisfactorily filling them will not be relieved. Statistics as to the number of uncertificated teachers make somewhat dismal reading. In March of this year there were in the service of this Board 110 teachers who had not received classification. Of this number, twenty-nine had fully qualified at the last departmental examination, but had not, on account of their youth or for other reasons, received their parchments. At present, therefore, about 30 per cent. of the adult teachers in this Board's service are uncertificated. Of the 110 teachers unclassed in March, no fewer than seventy-seven, or 70 per cent. of the whole, were without pupil-teacher or probationer experience when they received their first appointment under this Board. It should not be matter for surprise that many of these young people, by reason of imperfect education and lack of experience in the art of teaching, fail to accomplish satisfactorily the tasks allotted to them. The Board cannot effectively cope with the condition that these facts disclose. The positions held by the majority of these untrained teachers are poorly paid, and these positions, always numerous in Southland, have recently been rendered more so by the liberalizing of the staffs in two grades of schools. For such posts it is hopeless under present conditions to look for a constant and sufficient supply of thoroughly trained teachers; and it is evident that we must make the most of the material we have by shaping it to our necessities as best we can, by such means as the establishment of Saturday and correspondence classes, and by furnishing to inexperienced teachers the opportunity of spending a limited time in good schools of a grade similar to their own. But though the results of these agencies are encouraging as far as they go, they do little more than touch the fringe of the difficulty, and local training facilities, additional to those already in existence in the four large centres, are imperatively demanded. The multiplication of small schools at distances which render easy the transfer of pupils from one school to another, and which cause the roll numbers of adjacent schools to oscillate in accordance with the temporary popularity of a teacher or with the whims and caprices of parents and children, creates evils of the existence of which officers of Education Boards are fully cognisant. The application of the system of central schools to which the children of outlying districts could be driven daily would not only greatly increase the efficiency of the instruction in our schools, but would set free funds which would go far to render them much more acceptable than they now are from a hygienic standpoint. The policy is strongly opposed by parents, whose objections this Board at least finds it impossible to overcome. These objections in many cases do not appear to be valid, and I am convinced that no real hardship would be inflicted on parents or children by the closing of a number of schools. The average number of children per school in Southland is now fifty-eight; for the whole of the Dominion the average at the end of the year 1910 was seventy-five. If the whole of the Southland children could be aggregated in schools the average roll number of which was at least equal to that for the Dominion, the district would be served by 142 schools instead of by 185 as at present. The gain in increased efficiency and lessened administrative

cost is obvious. Considering the large number of schools in Southland to which low salaries are attached, there is cause for gratification that the *personnel* of the teaching body is as good as it is. Love for the work rather than consideration of material gain would appear in the case of most of our teachers to be the potent factor in determining their choice of profession. Yet, in view of the present rates of remuneration in other walks of life, the duties of which are not more responsible than are those of the teacher, it is not surprising, though it is to be deplored, that during the last fifteen years no fewer than forty-three male teachers have voluntarily left the service of the Southland Education Board to take up other work. In 1900 the proportion of male to female teachers was as 1 to 1: at present it is approximately as 3 to 5. Though much has been done in recent years to better the position of the teacher, it is obvious that something is yet wanting to attract to and to keep in the service the most promising of our young men. The Department's scheme for supplying school-books free to the children is not received with any degree of enthusiasm in this district. Inquiries made some time ago in a number of town, suburban, and rural schools indicated that over 80 per cent. of the children owned the books they used, and there is no reason to think that this percentage is any smaller to-day. There are many purposes (I have already indicated a few) to which this grant could be more profitably put. Here, however, I may be permitted to say that the *School Journal*, supplied monthly to the children, is proving itself an educational instrument of no mean value. The money expended on the production of this reader is, I am convinced, earning good interest for the State. On the matter of the syllabus I have little to say. I consider it an excellent one both in spirit and intention: If it is reasonably interpreted, and if, in small schools, full advantage is taken of the provisions for grouping certain classes in certain subjects, adequate compliance with its requirements does not impose undue strain on any class of school. My experience of its working, however, prompts me to suggest—(*a.*) Better definition of the work to be taught under Geography B. The syllabus does not limit the amount of work to be done in this subject. It leaves the choice and arrangement of matter in the hands of the teacher, so that his scheme of work may be adapted to local conditions and to his own personality and aptitudes. Could all teachers use this power wisely, the results of this freedom would be entirely beneficial. As it is there is no occasion to rail against the syllabus; the issue is rather whether the freedom given should not in the circumstances be somewhat restricted. I think it should. (*b.*) Greater prominence to history. (*c.*) Slight changes in the distribution of the work in arithmetic over the standard classes, and more mechanical work in the lower classes. A consideration of the needs of the many pupils who leave school after passing Standard VI, and for whom the high schools do not offer suitable courses of instruction, convinced the Board of the necessity of providing some form of continuation and secondary education adapted to local industrial conditions. As the High School Board of Governors was not prepared to modify the curricula of the schools under its control in the direction indicated, the Education Board, with the sanction of the Department, established a day technical college, which, though now only in its second term, has a roll number of 138 pupils. This large roll would seem to justify the establishment of an institution which will tend to mould the characters and develop the aptitudes of our young people at a most critical period of their lives, and to fit them for the spheres they will occupy in the industrial life of the community. But while the day college caters for several classes of pupils having different objectives, there is still a large class outside of its influence—a class that is, unfortunately, the least alive to its own interests. The considerations, material and moral, that lie behind the movement for the establishment of day technical schools and similar agencies in this and other countries have special cogency in respect of the class in question, and I believe the time has now arrived when a certain minimum attendance at continuation classes should, in the centres at least, be made compulsory on young people. There is evidence that even that small measure of compulsion represented by raising the standard of exemption to Standard VI is operating beneficially in raising the moral tone of semi-rural communities.

3. *Mr. Davidson.*] You spoke about the multiplicity of small schools: can you give any instances where in your opinion consolidation of schools might be carried out in this district?—Yes, there is a school at Brydon, midway between Gore and Mataura. From there by rail the children could reach either Mataura or Gore at about 9 o'clock in the morning, and get home at about 4 in the afternoon. That school has been established for some five years or more. There is also the Flint's Bush School, about three miles and a half from two other schools. We have out from Invercargill a number of country schools closely placed. For instance, there is the Myross and Roslyn schools, between which there is not more than twenty minutes' walk. At a distance of probably two miles and a half there is the Kennington School, to which the Roslyn, and probably the Myross, children could go. It is doubtful also whether there is warrant for the Woodlands and Longbush schools, which are not more than two miles apart, the road between being in excellent condition. There are a number of others I could quote. There is the Charlton schools, probably not more than three miles and a half from Gore, with excellent roads. On the other side there is the McNab School, not more than four miles from Gore, on the railway-line: service fairly suitable, though not entirely. However, the distance is not great and the roads are good. Up to Waimea Plains there are a number of small schools which, I think, might well be closed. There is one about three miles south of Riversdale, at the Pyramid siding. In the other direction we have the small school at Sandstone, a distance of about four miles, with good roads. There are others. I merely mentioned those which occur to me at the moment.

4. *Mr. Kirk.*] Could you prepare for the Commission a tabulated statement, with map, showing the schools which in your opinion should be grouped together?—Yes, I will do so.

5. *Mr. Davidson.*] You think the consolidation of those schools would lead to greater efficiency and greater economy as well?—I am strongly of that opinion.

6. I find in the 1910 report that there are 268 adult teachers in the Southland District, probably more since then, and that you have only one school in the highest grade. In Grade 9 you have only one, and in Grade 8 there are two schools. Do you think your highly qualified men have a reasonable chance of being promoted to schools of the 8th, 9th, or 10th grades?—No, certainly not the chance they ought to have within our own district.

7. What are the chances of their getting into other districts?—I know we have lost a number of good teachers, but so far as my memory serves none of them have gone to schools above the 4th grade.

8. During the whole of your experience of twenty-five years in Southland do you know of a single case of one of your teachers having been promoted to a school of Grade 8, 9, or 10 in another district?—No; at least, Mr. Adams, of Riverton, was appointed to Waimate, I think, about twenty-four years ago.

9. Do you think teachers in, say, the Auckland District have greater chances of promotion to those high-grade schools?—Yes, by reason of the larger number of schools, I should imagine so.

10. Then you think if the education districts were larger the chances of promotion would be greater?—Certainly.

11. Would you advocate a change in the boundaries of the present education districts?—Yes, I have felt that some change would be advisable. I would reduce the number of districts.

12. With regard to the syllabus, would you not reduce the quantity of arithmetic required in certain of the higher standards and make the work more practical?—Yes.

13. *Mr. Pirani.*] You said you did not know of instances of teachers in this district receiving important appointments outside. Was there not an instance of an Assistant Inspector being promoted to the position of Chief Inspector in the Wanganui District?—Yes.

14. And was not a secondary-school teacher, Miss Cruickshank, promoted to Wanganui?—That is so.

15. Do you think it would be an advantage if technical, secondary, and primary education were placed under one head?—Yes, especially for the syllabus, with a reservation that I think the controlling body would probably find it necessary to seek expert assistance for the educational subjects.

16. *Mr. Kirk.*] What have you to say as to the suggestion that the pay of women should be equal to that of men in the service?—I think there should be a salary attached to each position, no matter who holds it. It rests with the Board to make the appointment.

17. Do you wish to give reasons in support of that?—No, except that we have in this district a number of positions filled by ladies, who do the work admirably.

18. *Mr. Wells.*] I understand it is the practice in this district for the Board to send four names to the Committee for selection?—Yes, usually four.

19. I suppose it often happens that those four are not exactly level as regards merit and ability?—Yes.

20. Do you place them in order of merit?—Yes.

21. Have you ever known the Committee to select other than the top name?—It is more usual for the Committee to take any other than the top name.

22. Would that not have a most discouraging effect upon the deserving teachers?—I am certain it has.

23. In order to avoid that sort of thing, would you be in favour of a scheme of promotions being made from a graded list?—I do not think that is even necessary for the prevention of such an evil. In Southland we had a regulation governing the appointment of teachers which I think would have done away with the evil. So far as I am aware, the scheme gave entire satisfaction to the teachers and to a large majority of the School Committees. Under that scheme only one name was sent in. The Board, in consultation with the Inspectors, went carefully over the papers and selected the candidate who in their opinion was best adapted for the position of promotion. They sent that name to the Committee, with an intimation that the Board proposed to appoint that person, asking the Committee either to acquiesce or to give reasons against the appointment of that person and in favour of some other person. They could not object on general grounds. At the same time the papers of the other candidates were sent down, so that it was a consultation within the meaning of the Act. Then if the Committee acquiesced the appointment was automatically made. If the Committee objected, and the Board, after reviewing the Committee's objections, saw fit to reverse its decision, it usually appointed the Committee's nominee.

24. I suppose you and Mr. Wylie have a personal knowledge of all the teachers in the district?—Yes.

25. Do you think it would be possible, if you two were to consult together annually, to arrange the teachers in a graded list?—Yes, I believe it would be quite possible.

26. You believe the Inspectors are the men who can best judge of the qualifications of the teachers, being the men who see them at their work?—Yes, broadly speaking that is correct.

27. You think it would be quite possible, then, to grade them in order of merit so that when a vacancy occurs and the applications come in you could pick out the top name from among the applicants—the name which stands highest on the graded list?—Yes; but would it not be more satisfactory to pick out the top name and submit it to the Committee for approval, as I have suggested?

28. Would not there be a great advantage in having the teachers graded annually, so that the list would be ready every year?—Yes, so far as this particular district is concerned, but not to gauge the fitness of candidates from outside, and we in Southland sadly want them.

29. Suppose the Dominion were divided differently, and there were only some six or eight Boards instead of thirteen, and the teachers were so graded, would it not be feasible for one

teacher to be moved to another district?—Yes. Now if a person from outside makes an application for a position in Southland, the Secretary has instructions to make inquiries from the district from which that person comes. I admit it is not easy to compare under the present system.

30. Is it within your knowledge that the present system leads to canvassing?—I have only heard so. They do not canvas the Inspectors.

31. Has there been canvassing of the Committees?—I have been told by members of Committees that candidates have seen them.

32. Do you think that a bad system?—Undoubtedly I do. As a matter of fact, we have a regulation disqualifying any teacher who canvasses, but it is more honoured in the breach than in the observance.

33. Do you think public opinion here would support compulsory attendance at continuation classes?—I am not in a position to answer that question. I personally am in favour of continuation classes.

34. Can you offer any opinion of the qualifications of the boys that are being turned out from our schools now as compared with ten or fifteen years ago?—I have no hesitation in saying that the product to-day is as good as ever it was. That is my deliberate opinion.

35. Is there too much examination?—No.

36. Would you be in favour of doing away with one term examination?—No, I think three examinations are necessary.

37. You spoke of a shortage of teachers and of heroic measures to meet the difficulty—namely, the importation of teachers?—That was the Board's suggestion.

38. They would be imported, would they not, mainly with a view to filling the country schools?—I presume so. I am not in the confidence of the Board.

39. Do you not think, before teachers are brought out from the Old Country, the conditions prevailing in our backblock settlements and the conditions of life generally here should be made very clear to them?—Certainly.

40. Do you not think that if they were brought out expecting employment under conditions such as now exist in the Old Country there would be a bitter cry when they found what they had to face?—They would be grievously disappointed.

41. We would have to go about this very cautiously?—Yes; but it will not be possible to procure teachers unless we can guarantee salaries of £150 to £180 for them.

42. Do you know anything of the child-labour here in the country districts?—I have come across a good deal of excessive child-labour in the dairying districts, but less latterly than there used to be the case, probably on account of the introduction of milking-machines. I think the conditions have improved now.

43. Has it come under your notice that children have reached school unfit for work?—Yes, several times that has come under my personal notice. I have known children to fall asleep during the day.

44. Do you know anything of such conditions prevailing in the towns, in the way of children going out on milk-carts in the early morning and selling newspapers at night?—No, I have not investigated any such cases.

45. What is done in this district in connection with school libraries?—Nothing by the Board, but, nevertheless, a considerable number of schools have established school libraries. The Board does subsidize these efforts.

46. Have you given any thought to the matter of local rating towards the cost of education?—Not very much. I do not care to speak about it.

47. Have you heard it suggested at all that the average roll number rather than the average attendance should count in the staffing and grading of schools?—Yes, but I do not think that would be an improvement. I think the present system is the best.

48. Have you any instances in this district of country schools growing very rapidly through mining and milling industries?—Yes.

49. If a young fellow straight from the Training College was appointed to such a school, and it grew very rapidly, do you think the Board should have power to transfer him in order to put in a more experienced teacher, who deserved promotion to such a school?—Yes. I do not think there would be any hardship in doing that.

50. Do you think the State is getting good value for the money expended on education?—In my deliberate opinion it is.

51. Would you make your remarks apply to all free books: would you strike off the supplementary readers?—No, I should like them retained.

52. Your remarks apply only to those books a child should take home?—Yes.

53. It is your experience that they buy these books rather than not have them at home?—Yes, the great majority do.

54. Supposing the children were allowed to take the free books home, do you think any objection would be raised at the end of the year when they came to be handed out again?—Yes, I have heard many objections urged, and I think the parents would still purchase the books.

55. *The Chairman.*] Have you given any thought to the question of setting up a national Council of Education in order to secure uniformity of policy and interpretation of the regulations?—Yes, I think such a Council is quite necessary.

DUNCAN MCNEIL examined on oath. (No. 65.)

1. *The Chairman.*] What is your position?—I am headmaster of the Waihopai School, and I have been in charge for nineteen years. I was in charge of a number of country schools before that. I am a B.A. of the New Zealand University.

2. You wish to speak on behalf of the Southland Branch of the Educational Institute in regard to certain of the orders of reference in the Commission?—Yes. I desire to support the proposal, advocated by the New Zealand Educational Institute for a number of years past, in favour of establishing, for the appointment of teachers, a definite plan which would be effectively national in its operation, and which would better secure that promotion should be in accordance with merit. Though the Act regulating the appointment of teachers in primary schools was not designed to make the teaching service sectional in regard to appointments, yet the administration of that Act has tended to create subdivisions corresponding to the education districts. Education Boards, it is true, do occasionally, in filling a vacancy, choose a teacher who is not at the time in their employ, but this is infrequent in the case of good positions. Speaking generally, unless there should happen to be a dearth of suitable local candidates, the applicant from another district is treated as an outsider, and his claims do not receive equal consideration. This anomalous feature appears all the more out of place when it is remembered that in other essential respects our education system is national. Thus the school syllabus, the classification of teachers, the scale of staffs and salaries, the superannuation scheme are all administered on a Dominion basis without any district restrictions arising from the local administration. To put the case by means of a concrete example: if a Southlander has qualified as a teacher at one of the State-established training colleges, has passed the New Zealand Education Department's examination, and received its certificate, why should any obstacle stand in the way of his obtaining an appointment in any district of the Dominion if his merit entitles him to it? I think I am right in saying that no other Department of the public service places its servants under the disability of having their scope for advancement hampered by provincial subdivisions. Teachers as just as truly and essentially servants of the State as if their appointment and dismissal lay directly in the hands of the Department; and the fact that they are under the control of local Boards should not impose any needless disadvantage on them. The full extent to which district barriers affect appointments is not easy to determine, but they are, at any rate, a large enough factor to prove detrimental to education. On the one hand, the resulting limitation in the range of selection makes it certain that positions cannot always be filled to the best advantage. On the other hand, the limitation of every teacher's prospect of promotion is prejudicial to that spirit of enthusiasm and progressive effort which it is so highly desirable to keep alive in the profession. It has been the discouraging experience of more than one aspiring young teacher to realize, through repeated disappointments, how precarious were his hopes that he might regard the schools of the Dominion as his field for possible promotion. In the smaller districts, where the well-paid positions are very few and but very seldom vacant, the outlook for teachers who are prepared for self-sacrificing effort must appear narrow indeed. It seems clear that, if a scheme could be devised whereby every appointment would be made on the basis of merit, irrespective of what district the applicants might belong to, a real cause of disaffection among deserving teachers would be removed, and, correspondingly, a better incentive would be afforded to strive for increased efficiency. But the administration of the appointments Act leads to another grievance quite distinct from that which has been indicated. If there is just cause of complaint in the case of an applicant who is virtually disqualified for a position because he is regarded as an outsider, there is also, on the part of the teachers within the district where the position is to be filled occasional cause for dissatisfaction in that promotion by merit is not the invariable rule applied to their case. It need hardly be said that this is not put forward as a reflection on the integrity of the authorities concerned in making the appointments. It arises rather from the faultiness and inadequacy of the procedure usually followed in selecting and appointing a teacher. Except in the case of the Boards which have established grading schemes, there is no effective method employed whereby the comparative claims of applicants for a given appointment may be justly assessed, and whereby also the appointment may be made in accordance with such assessment. In determining to whom the preference should thus be given, it will be generally admitted that the dominant consideration should be proved efficiency. Now, efficiency cannot be judged by any mechanical criterion. For instance, length of service, certificates, high attainments in learning, though by no means negligible criteria, do not furnish decisive evidence as to a teacher's practical ability in his craft. The quality of the work he has been doing is the only sure guide, and this is a matter which can be estimated only by the trained and experienced judgment of an expert. The Inspector, who periodically tests and observed the work of the teacher, is the only one in a position to judge efficiency. Accordingly, in a sound method of appointing teachers, the Inspector's estimate should form a factor on no account to be nullified in the process of making and fixing the selection. It is just at this point that prevailing methods are most at fault. The common practice among Boards is to send the names of several applicants in order of merit to the School Committee, on whose recommendation, even when it completely sets at naught the ranking of the names by the Board, the appointment is made. The Committee has not before it the most important data on which its choice should be based, the significance of the certificates and other credentials which are forwarded is not always understood aright. On the plain ground that School Committees are not in a position to judge the issue put into their hands, I hold that the onus of choice should not be with them. But even as regards the Board's ranking of chosen applicants, there is often no systematic process followed to give to every consideration affecting a teacher's claim its relative value in the final estimate. Departmental certificates, if teachers are to be expected to attach any importance to them, must count for a little, and length of service is not to be wholly set aside, while personality is of recognized importance. The pre-eminent place of proved efficiency has already been emphasized. To ensure a methodical and comprehensive estimate of every applicant's qualifications, and to prevent unfair discrimination against outside applicants, the Institute advocates the establishment of a uniform grading scheme similar in principle to the schemes which have for two or three years been in force in Auckland and Wanganui. Just as the fear

at one time expressed that the adoption of a Dominion scale of staffs and salaries would impair the vitality of local administration proved groundless, so there is no valid ground for entertaining any like apprehension in case the Institute's proposal regarding appointments should be carried. In the grading schemes referred to, numerical values are assigned for efficiency, personality, certificate, length of service, &c.; and all teachers have the marks to which they are entitled under each heading recorded in a register, which is revised annually. In selecting names for a vacancy the Board is guided by the totals of the candidates' marks as shown in the register. If a particular candidate shows a substantial excess of marks over the rest, the appointment is his unless a cogent reason for passing over him can be specified. If several are equal or approximately so, the choice is confined to these. In support of the proposal I would urge, first, its adequacy as a remedy for the defects pointed out in the present mode of appointing teachers; secondly, the successful local trials given to grading schemes in two or three districts; thirdly, the approval of the Boards as affirmed at a conference of their representatives two years ago; and, fourthly, the indorsement of the Inspectors who at their last conference agreed upon a model grading scheme. It has been objected that, in order to secure a fairly even standard in allotting the marks for efficiency, the Inspectors would require to be under the central Department, so that, by periodical conferences and departmental instructions, their assessments would be guided on similar lines. That safeguard seems to me just as practicable under the present order of things. Under whichever authority—Boards or Department—the Inspectors might be placed, they would have to be located for practically the whole year in the several districts as they are now; and the interpretation of the proposed appointment regulations could be just as easily communicated to them or discussed in conference by them in the one case as in the other. It may be pointed out in this connection that for the purpose of determining the figure to be assigned to each teacher's certificate (as in D1, C3, &c.), the Department has all along accepted the estimate of efficiency furnished by the Board's Inspectors. I have only to add that the views I have put forward express not merely my personal convictions, but the off-repeated opinion of the Teachers' Institute of this district, as also, I believe, substantially that of the New Zealand Educational Institute. Scholarships: A resolution was affirmed last January by the New Zealand Educational Institute to the effect that Junior National and Education Board Junior Scholarships should be abolished, and the money so saved should be spent in paving the lodging-expenses of those children who are highest in the list of the Junior Free Place Examination, and who require to live away from home in order to attend a secondary school. I wish to support the essential part of this recommendation, although I think that the idea that its adoption would constitute abolition of scholarships is quite fallacious. Whatever name the proposed lodging-allowance to be allotted on an examination test might bear, it would seem to me to all intents and purposes a scholarship. I would therefore prefer to put the suggestion as propounding fresh conditions for the allotment of scholarships so that their purpose would be better served. In view of the great extension of free secondary education within the last decade, scholarships can now serve but one good purpose—that of bringing free secondary or technical education within reach of children who could not otherwise have obtained these boons. It is not so long ago since scholarship examinations were held to serve, in a measure, an important additional purpose. The view then current was that the State should provide post-primary education for those children only who showed pronounced intellectual ability. The State, it was argued, would in due time reap the advantage of enabling the intellectual elite among the rising generation to develop their talents to the fullest. As to children of ordinary capacity, or below that standard, a thorough primary education comprised the State's responsibility towards their training. Under this conception scholarship examinations were the best-known means of selecting those who would most benefit by the privileges to be offered. This idea was doubtless largely justified when post-primary education was of the one traditional type diligently followed by the high schools of past years. That conservative course of instruction, however, began to differentiate, admitting, for example, commercial branches, and so also tacitly admitting the validity of vocational training in schools. The new departure developed until it resulted in separate institutions, and very shortly technical day schools will take equal rank with what are more specifically denominated secondary schools. Concurrently with this progress the door of admission to free secondary, and, lately, free technical, education was opened wider and wider, until practically every child who has made fairly good use of the primary school may now freely carry his education over the next stage, with a choice between two kinds of schools at his option. Distance from these institutions is the chief remaining barrier as regards a large number of children availing themselves of their new educational opportunities. But free railway passes have cancelled this difficulty in the case of many. The conditions of allocating scholarship moneys should then be accommodated to all these changed circumstances. Payment of fees being now practically done away with, these scholars who from their own homes, or by utilizing suitable train services, can attend secondary institutions no longer require State assistance in the form of scholarships. As a matter of fact, many scholarship-holders of the last few years could and would have received secondary or technical education had no scholarships been available. It is otherwise with those at a distance from the large centres or from railway-lines. To assist these and put them on an equal footing with the rest it would seem possible to formulate a plan restricting the allocation of the scholarship (or lodging-allowance, if the term be preferred) on the general principle laid down in the resolution. I think that, with a view to getting the greatest value for the expenditure, it would be worth attempting to give practical shape to the suggestion made. I have spoken of secondary and technical schools as possessing equal claims in regard to having entrance to their classes provided for by scholarships. This is not a part of the Institute's resolution; but I take the opportunity of suggesting that all free-place pupils and scholarship-winners alike should have the option of which class of school they are to attend. It has been contended that if the Institute's resolution is carried into effect the special preparation of the best

pupils in the proficiency classes which is now entailed by scholarship examinations would disappear from the schools, not wholly, I fear. For the schools having pupils eligible for the proposed allowances would still be tempted to bestow special coaching with a view to success at whatever examination might be fixed upon as a guide for selecting the best talent. Unless some other test than that supplied by examinations could be found (and I am afraid that is not possible), the eagerness of parents and of teachers will always engender a competitive spirit with the resultant special coaching.

3. *Mr. Wells.*] Do you think there is much coaching done here for scholarships?—A good deal.

4. After-hours work?—Yes.

5. If you abolish the scholarships, would you give a book-allowance to town children in lieu of the present scholarship?—I should think that would be a very large and expensive order, and that the present scholarship allowance would be pretty well swallowed up in doing so.

6. Would you give that assistance to the pupils who claimed they actually needed it?—The difficulty would be to determine who should and who should not receive such assistance. That is the reason why I have not suggested that the scholarships should be limited to the pupils of parents of a given income.

7. Do you not know that the Managers of technical schools deal with applicants in that way—applications for monetary assistance are heard in camera, and the assistance is given?—If the information can be obtained with a sufficient degree of reliability I would agree with it.

8. *Mr. Davidson.*] What distance is your school from Invercargill?—A mile and a half.

9. Do your children attend the technical day classes for woodwork and cookery?—Yes. A bus is sent round for them by the Education Board. The Board pays for their conveyance.

10. Do you find that the manual work in the schools entails much clerical work in the preparation of returns?—A great deal.

11. Can you suggest any other method of payment for the instruction in these subjects?—I have not considered any other matter.

ALEXANDER INGLIS examined on oath. (No. 66.)

1. *The Chairman.*] What is your position?—I am headmaster of the Invercargill North School, and I have been in that position ten years. I was previously engaged in teaching in different parts of Southland.

2. Do you appear as a representative of the Southland Branch of the Educational Institute?—Yes. I wish to bring forward the views of our Institute in regard to the centralization of the inspectorate. The proposal to centralize the inspectorate is open to objection for—(1.) The change would constitute a critical step towards centralizing the whole education system of New Zealand. (2.) It would also permit of political influence being brought to bear upon appointments to the inspectorate. This is an important point, which, however, scarcely requires elaboration. (3.) To make Inspectors officers of the central Department working under the direction of Education Boards would mean the creation of a dual authority over Inspectors, with all its possibilities of conflict as between the central Department and the local bodies. This objection derives considerable force from the working of the present system of dual control as regards that part of the administration which deals with new schools, additions to existing schools, &c. This administrative partnership has been the cause of much friction between Education Boards and the central Department, and has been responsible for vexatious delays in supplying the legitimate and frequently the urgent educational wants of the different districts. Inspectors are a necessary link between the Boards and their employees the teachers, and if the Inspectors are no longer to be Board officers, then the Boards cannot remain in a position to control the teachers justly and effectively. In addition to carrying out the regular work of supervision and examination, Inspectors are required to conduct official inquiries, to furnish special reports, and to give confidential advice regarding the numerous particular cases involving suspensions, dismissals, transfers, and appointments of teachers, so that Boards may be enabled to take the right course in every instance. These important inspectorial functions will be exercised more effectively and with a deeper sense of responsibility if the Inspectors are under the sole control of the Education Boards. It therefore appears to be an unassailable position that both teachers and Inspectors ought to be under the one authority. (4.) It is in the interests of education to have the Inspectors independent of the central Department, and in a position, therefore, to criticize frankly its proposals and enactments. The Inspectors are in intimate touch with schools and teachers, and their daily contact with school-work under varying conditions enables them to observe the actual working of new departures. They represent class-room experience, the Department represents educational theory; and both are required in building up a course of instruction. But if the Inspectors were officers of the central Department, all that salutary criticism which is now available to the public would be in danger of being suppressed or watered down to the point of making it harmless. (5.) Local government with its consequent local interest has imparted to our education system a vitality which would be considerably weakened by the transfer of any of the essential functions of administering the schools from the local bodies to a distant and inaccessible central authority. There is no department of public administration in which local government is more to be desired than that of education. In the training of the young the school and the home are agencies which cannot work too closely in unison, and to secure the effective co-operation of these two educative forces the stimulus of local interest appears to be a necessary condition. If that be so, then it follows that a sound policy would operate in the direction of increasing the usefulness of local control by systematizing its functions rather than in the direction of sapping its vigour of curtailing its powers. Further, strong local bodies constitute a safeguard against hasty acts of retrenchment being directed first against education, which, in times of financial depression, is apt to be regarded as a national luxury to be stinted

freely if economy demands it. At such times, when the Legislature is strongly tempted to exercise its power to cripple the education system, it is well to have vigorous provincial bodies, which are deeply concerned in the welfare of the schools, to stand between a needy Ministry and the education vote. (6.) It is difficult to ascertain the specific reasons in favour of a centralized inspectorate. One reason put forward is that a more uniform interpretation of the syllabus and the regulations would be secured were the Inspectors to be moved frequently from district to district. Under the present system a conference of the Chief Inspectors at Wellington would provide for such uniform interpretation. Moreover, since the personal idiosyncrasies of Inspectors determine in large measure the extent and direction of particular lines of school-work, an itinerant inspectorate would tend to have an unsettling influence upon the education policy of a district by the introduction of frequent changes depending on the degree of prominence given by the Inspectors to different parts of the school course. For these reasons I am of the opinion that the proposed change would lower the vitality, and thus impair the efficiency, of our primary-education system. In bringing the subject of the primary-school syllabus under your notice I should like to say that the prevailing opinion amongst Southland teachers is that, while the present syllabus has very fully met the demands for supplementing oral and book instruction with more manual training and observational work, it has failed altogether to afford the desired relief as to the quantity of matter to be attempted. If certain subjects have been curtained—*e.g.*, arithmetic, political geography, formal grammar—a full equivalent has been introduced in other respects—*e.g.*, handwork, cookery and woodwork, nature-study, physical, commercial and industrial, and mathematical geography, drawing and elementary science. We hold that the syllabus without being in the least impoverished thereby, could be simplified in form and considerably reduced as to its content, to the great advantage of education. By attempting less, we feel that we could achieve more. On this point there is no diversity of opinion. As the fact that liberty has been given to teachers to draw up their own programmes of work for the various classes has frequently been put forward as a sufficient safeguard against the persisting evil of attempting to cover too much ground, I wish to point out that, in the more essential subjects, this liberty is more nominal than real. Thus the wording of the syllabus—clauses 36 to 46—does not suggest that, in English and arithmetic, anything prescribed is optional. Moreover, the departmental test-cards in these two subjects cover all the prescribed work, and these test-cards furnish to the teacher his most authoritative interpretation of the syllabus. In geography, course A, the occurrence of the word "optional" in relation to three minor points implies that the rest of course A is obligatory, and it is so understood. With the exception of the three minor points referred to, the proficiency examinations take into account all that is prescribed. In course B, while some latitude as to subject-matter is conceded (clause 42), on the other hand, clause 43 requires oral instruction to supplement the geographical reader, and also requires fuller treatment than is implied in the lengthy model scheme of the previous clause. The minimum of eighty hours stipulated would not enable the standard here set up to be attained. The questions for the Proficiency Examinations will naturally be partly drawn from course B, so that a thorough and individual knowledge on the part of the pupils is by this fact alone rendered imperative. The practice of holding the Proficiency Examinations at centres makes it impossible for Inspectors to take cognisance of individual programmes of work. Similarly, in the course in drawing, there is no room left for the teacher to determine how much he will attempt to teach, for the proficiency tests cover all the prescribed programme. Thus it is only in history, in nature-study and elementary science, in agriculture, handwork, and health, that any real freedom lies with the teacher to compile his own scheme of work. While disclaiming any intention of dealing exhaustively with the question of how best to remedy the fault under notice, I venture to suggest a few directions in which the curriculum might be lightened or modified. (1.) Arithmetic: (*a.*) The work in Standard III does not embrace any new principles. It practically consists in applying the principles learned in Standard II to higher numbers. I should suggest that the compound multiplication and division of Standard II, or the long multiplication of money and the talbes of avoirdupois weight and long measure included in the heavy programme of Standard IV should be transferred to Standard III. (*b.*) Some of the work under Standard VI is of doubtful utility in practical life—*e.g.*, square root, the relation between the squares on the sides of a right-angled triangle, and possibly time and rate sums. Although the syllabus requires "very simple examples in the use of the metric tables," and "simple cases of mensuration," the departmental test-cards frequently contain examples of a difficult nature. I may also add that these departmental tests are sometimes very uneven, easy and difficult cards being found in the hands of members of a class at the same examination. (2.) Geography: Course A: The programme for Standard VI is too ambitious, much of the work being too difficult for the average child attending the primary school. I should recommend that the following topics be transferred to the syllabus of the secondary school: (*a*) Explanation of the causes of the tides: (*b*) inferences from the observation of astronomical phenomena respecting (i) approximately stable position of the earth's axis; (ii) inclination of the axis; (iii) annual revolution; (iv) cause of the seasons: (*c*) problems in finding the latitude from the meridian altitude of the sun: (*d*) problems in finding differences of local time from longitude: (*e*) all the work marked "optional." Course B: For the reasons stated above, the work in this course should be more carefully defined. (3.) Drawing—Geometrical drawing for Standard V: The numerous difficult cases of "the construction of triangles and of quadrilaterals from given data" render it necessary that a selection of the cases should be given. The following should be excluded: (*a*) The general method of constructing the polygons named; (*b*) reducing and enlarging figures by means of proportinal scales. (4.) Nature-study: I should suggest the exclusion of definite courses of nature-study. The demands made by other branches of the school course for observational and experimental treatment are already sufficiently heavy,

while the utility of observational botany and zoology in equipping children for the battle of life is extremely doubtful. Without seeking to depreciate whatever educational worth these definite courses of nature-study may possess, I am of opinion that their disappearance from the syllabus would not seriously detract from the value of the school course. For it should not be forgotten that, after all, nature-study or observational work is a method, not a subject. (5.) Woodwork and cookery: It is open to serious question whether the country is getting an adequate return for the time spent by children at these classes. I refer more particularly to the inclusion of Standard IV in the manual-training course. Only in the largest schools is the course limited to Standards V and VI. The result is that, in the large majority of schools, the work in woodwork and cookery begins with the Fourth Standard, and consequently lasts three years. I am of the opinion that the children of Standard IV are too young to derive much benefit from such a course, and that the time would be spent to better purpose at the work of the main school. I also wish to mention that, in the case of the girls, a considerable portion of the time is taken up in the transcription from dictation of cookery notes and recipes, which require to be rewritten at home. This work appears to be foreign to the purposes of a cookery class, and in these days of cheap printing cannot be classed otherwise than as a waste of time. (6.) Term examinations: The number of term examinations should be reduced from three to two, by cutting out the first examination, which is of small practical value.

3. *Mr. Wells.*] Would you be in favour of a redivision of the Dominion into education districts, so as to have the districts of a more uniform size and fewer of them?—Yes, I should be in favour of reducing the number.

4. There would then be a strong inspectorate in each district?—Yes.

5. Do you think that would meet all requirements?—Yes.

6. *Mr. Poland.*] Do you think that the system of bringing the Sixth Standard country candidates to a centre gives all these candidates a fair opportunity to show their work?—I have always been of opinion that it did not, as a result of my experience. I know one child who got 60 per cent. to 80 per cent. in the arithmetic examinations during the year, and at the Proficiency Examination she got nothing: her marks were nil. I have had one or two examples like that. I do not think a highly strung child has a chance at these centres.

7. *Mr. Kirk.*] Taking into consideration the fact that the State's corrective control in regard to boys and girls ceases just at a time when the blood is changing, do you favour boys and girls being compelled to continue their education at continuation classes?—I have given some thought to that, and I am inclined to think if that were insisted on we would get in many cases only the real value of the earlier education.

8. *Mr. Davidson.*] Would you be in favour of dividing the Dominion into education districts whose boundaries would be similar to the present university districts?—I am not so sure. I have tried to follow that out, and I am not so sure but that a better division might mean a little increase in the number of districts.

9. If the number of education districts were reduced to, say, six, and the inspectorate were placed under the control of the Education Department, do you not think that would lead to greater uniformity in the interpretation of the syllabus?—Possibly it would, but I do not see why it could not be done under the present system. I would suggest six education districts, with conferences of the Inspectors at Wellington.

10. You referred to the unevenness of these test-cards?—Yes.

11. If the inspectorate were centralized, and these cards prepared by the representatives of the inspectorate, do you not think the evils you complain of would disappear?—I do not think you are referring the evil to the right source. Possibly the cards are now prepared in Wellington for all I know.

12. We will suppose that they were prepared at a conference of Inspectors: do you think that would lead to more evenness?—I think the unevenness of the cards is a very small matter that can be got over without any centralization of the inspectorate. Perhaps the unevenness requires only to be mentioned to be remedied.

13. *Mr. Pirani.*] What is your system of examining candidates for proficiency certificates in this district?—We have some thirty-five centres, at which all the children in Southland are examined.

14. Do you not think it could be done in their own schools, with an assistant supervising in the person of the Chairman of the Committee or some other responsible person in the absence of the Inspector?—I doubt it.

15. That is what we do in our districts?—I was not aware of that.

16. *Mr. Hogben.*] Are you aware that a modification of that method in Wanganui would be in accordance with the regulations?—Yes, I know several courses are suggested.

17. Have you carefully looked through the syllabus and noted in how many of the subjects the amount of work depends entirely on the programme the teacher draws up?—I have, but the practical working robs the teacher of the freedom that is probably given to him in the syllabus.

18. How does it?—I refer to the Proficiency Examinations at the different centres. No Inspector could possibly take account of the different programmes of work. Sometimes there are nine to twelve small schools being examined in one room, and all the Inspectors can do—at least, what they try to do here—is to strike a sort of average paper that the programmes of work will possibly cover.

19. You know the Junior Free Place Examination, and that the pupils have a choice of five out of twelve or thirteen questions?—Yes.

20. So that practically the pupils are only obliged to do five-twelfths or five-thirteenths of the work set?—Yes.

21. Do you not think it would be possible for the Inspectors to do the same in setting the

papers for the Proficiency Examination?—That would certainly relieve the situation, but it has to be remembered that young children very often become distracted when they see a long list of questions, and really do not know which question to take up. There is a possibility of the value of the selection being lost by the distracting nature of the quantity on the paper.

22. Do you think it might be relieved?—It would to some extent.

23. And if they were examined at their own schools by their own teachers on their own programmes it would be done away with altogether?—Yes.

24. Do you not think an Inspector, then, in a subject like geography would be justified in the case of a well-known efficient teacher in accepting the teacher's results?—I think so.

25. The syllabus allows him to do that?—Yes.

26. Would that not overcome the difficulty in regard to those subjects?—Yes; in the case of teachers who are thoroughly efficient and reliable. It would not apply to the district generally, because we have a very large number of uncertificated teachers, and some of the certificated teachers are too inexperienced to entrust with the responsibility.

27. But do they come to centres from those distant schools when they are inexperienced?—Yes.

28. At what distance from the centre?—Well, Mr. Neil would be able to tell you. There is a school at Awatatara, and there are other places at greater distances.

29. Would you consider seventeen miles a convenient radius?—It all depends upon the nature of the conveyance. Seventeen miles by hack on a bad road would be a very inconvenient distance.

30. With regard to mathematical geography in Standards V and VI, have you not noticed that most of those subjects are optional? Is that not indicated in paragraph 5?—Paragraph 5 was not mentioned in my objection.

31. Which particular thing on the programme do you object to?—The approximately stable position of the earth's axis.

32. Is that not one of the easiest things on the programme to teach?—I have not found it so.

33. It is easier than the daily rotation of the earth?—What is easy to the mature mind is often difficult to children.

34. Have you tried it with children?—Oh, yes. I give them all the knowledge I can, but I do not think they grasp the explanation.

35. Do you know they teach these things in every country in Europe?—I do not think you will find the explanation of the axis and of the seasons in the Scottish code—speaking from memory.

36. I was speaking of continental Europe. Do you think the Scottish code a good one?—I only mentioned it to indicate that we would not be an exception if we took this out of the syllabus. I simply say that I, in common with other teachers, consider there are certain subjects which are too difficult for the immature mind to grasp, and that in trying to teach them we are wasting our time in futile work.

JAMES HAIN examined on oath. (No. 67.)

1. *The Chairman.*] What is your position?—I am headmaster of the Invercargill Park School, and have been so for sixteen years. I have been first assistant at the South School, and second at the Middle School.

2. Will you kindly state your case?—The allocation of the grant in connection with free school-books has not met with favour in Southland. There has never been the slightest difficulty in getting the parents to provide all the material necessary for school-work. More particularly is this the case in connection with permanent material, such as reading-books and those for arithmetic, geography, and history. If the grant is necessary at all, then the opinion in this province is that it ought to go towards the provision of stationery, pens, pencils, and ink. Under the term "stationery" might be included copybooks, blank drawing-books, and the writing-tablets that are now used instead of slates. It is true that in connection with these writing-tablets a part of the grant may be set aside now for their purchase, but this concession is burdened with a condition that School Committees shall provide an amount equal to that portion of the grant supplied by the Education Boards. It is noteworthy that, in spite of the difficulty which our School Committees experience in making both ends meet, this additional expenditure was cheerfully undertaken because of the general agreement that this was a direction in which a little relief would be felt most welcome. If books may not be taken home half their usefulness disappears, and if the children are permitted to take them home, then their usefulness would be limited in time to a single year. I do not suppose that in more than 50 per cent. of cases do the school-books that are the children's own property outlast the needs of the pupils for whom they are originally bought; and, if this is so where their own property is concerned, it may easily be imagined how that percentage would be reduced were the responsibility of ownership removed. In most of our schools slates have been abandoned for some time in favour of writing-tablets, and the results have proved beneficial. With ordinarily good supervision there is less slipshod work. The whole process by which results are arrived at must be shown, and thus there is a powerful check upon dishonesty. Altogether the use of writing-tablets instead of slates makes for increased accuracy in figuring, spelling, and composition. There is no necessity for these tablets to be taken out of school. Experience has shown that where this has been allowed they have lasted only about half the time that they should have. It is strongly felt in this district that the best way for allocating the grant would be in the direction I have indicated—viz., the purchase of copybooks, blank drawing-books, pens, ink, pencils, and writing-tablets. A suggestion to improve the method of arriving at the number that fixes the grade of a school: It is per-

fectly well known to the members of the Commission that the grade of a school depends at present on the average attendance. The injustice of this is pretty generally recognized, and suggestions have been put forward from time to time in the direction of remedying such injustice. It has been sometimes argued that the grade of a school should depend on the roll number, but, because there seems to be a very strong opinion that this would put serious temptation in the way of teachers, the argument has never met with much acceptance. Certainly, were such a course adopted—and it really is the proper course—every teacher should see that the roll was kept correct by the removal of the names of children from the register immediately upon their leaving school. But I am not arguing for this. I do say, however, that the average attendance should go. In many districts the two winter quarters might keep a school in a lower grade than is proper when the correct roll number is taken into consideration. All the children attending the school have to be taught the lessons, and in cases of absence through sickness or stormy weather (and in Southland stormy weather lasts a considerable period sometimes) the staff has to do extra work, and at the same time lose the prospect of the benefits that would have accrued from a rise in grade. The suggestion that I wish to put forward is that the highest attendance of each week of the quarter should be taken, and at the end of the quarter the average of these attendances should be struck. The number thus obtained should fix the grade of a school.

3. *Mr. Kirk.*] How many teachers have you in your school?—I have three assistants and three pupil-teachers.

4. *Mr. Hogben.*] Do you think it necessary to have three schools like the Waihopai, the Invercargill Park, and the Middle Schools?—Yes, I think so.

5. What is the distance from the Invercargill Park to the Middle School?—About three-quarters of a mile.

6. How far from the Waihopai School?—About a mile.

7. Do you think there would be greater economy and efficiency by having two schools instead of three?—Considering the size of the schools, I do not think there would be.

8. *Mr. Kirk.*] How do you fare here for playgrounds?—Fairly well. In the case of the South School they have not a very large playground, but there is a reserve immediately opposite that they can use as a playground. My own school has a park at the back. The main school, which is right in town, has a fair-sized playground.

FRIDAY, 21ST JUNE, 1912.

NANCY JOBSON examined on oath. (No. 68.)

1. *The Chairman.*] What is your position?—I am Principal of the Girls' High School, and I have been in charge since the beginning of last year. I am an M.A. of the Melbourne University. Before coming here I was senior assistant at the Presbyterian Ladies' College, Melbourne, for five years, and before that I was teaching in Sydney and in Ballarat.

2. Have you any statement to make in regard to the subject-matter of our Commission?—Yes. I wish first to deal with the proficiency certificates and the work of primary schools. With regard to the proficiency certificate, I would state it as my opinion that the examination for that certificate does not seem to be a thorough test of proficiency, and therefore does not satisfactorily affect its purpose. In a New Zealand newspaper early in the year I found the following extract from an Inspector's report with regard to the increased number of proficiency certificates gained by pupils in the primary schools of the district: "In 1910 the percentage of proficiency certificates gained was 62; in 1911, 74 per cent. of the candidates were successful. Commenting on this, the Inspectors state that the figures indicate a higher state of efficiency in the schools, and show that the efforts of the teachers have been guided by a clearer view of the scope of the examination than formerly. The youths now leaving school could read with fluency ordinary current literature, and express their thoughts in writing with clearness, freedom, and in very fair style, and commanded a knowledge of arithmetic possibly a good deal beyond their future requirements." My experience thus far would not permit me to indorse the latter part of this paragraph, and it is not well that Inspectors should lay such a flattering unction to their souls. It is in the important branches referred to herein—proficiency in English and arithmetic—that I have found a decided weakness in the majority of proficiency pupils. It is due, I think, not to any lack of efficiency on the part of the primary teachers, whose excellent work I fully appreciate, but to the fact that too much attention is given to subjects less fundamental to education, and that the syllabus in some respects lacks definiteness, which in turn conduces to a lack of thoroughness. In arithmetic the chief aim should be to ensure correct and rapid working of ordinary arithmetical processes and the ready use of the best and most practical method. In English I would strongly advocate the reinstatement of grammar upon the syllabus, though by no means desiring a return to the old state of affairs when grammar was a grievous and unprofitable burden. Yet the simple and fundamental rules of grammar are a necessity: its importance in relation to English composition and as a basis for the study of foreign languages will surely be admitted by any experienced teacher of these subjects, who has probably found the ignorance of elementary grammatical principles a serious difficulty to overcome. I would also draw attention to the general neglect of history and political geography in the primary schools. These subjects, in addition to being of great educational importance, are surely a very necessary factor in the training of the future citizens of a young nation, isolated, too, as it is from the rest of the world. When in Melbourne lately I was asked by one greatly interested in education whether what she had seen in a New Zealand paper was indicative of the general attitude of educational authorities towards history. "The questions on New Zealand geography were very well done, while in the less interesting subject—the reign of Queen Elizabeth—satisfactory answers were also given." The utilitarian spirit is

entering too much into education: everything is regarded from the point of view of pounds shillings and pence, and the true aim of education is forgotten. The study of history in some form or other should be established on a firm footing in our primary and secondary schools, and that of geography also. The University authorities have now raised the marks in history at the Junior Scholarship Examination from 425 to 575—soon to be 600—which alteration will probably induce more candidates to take it as a subject. (Hitherto in all other subjects the possible total ranged between 600 and 1,500.) If history and geography are given their rightful places on school time-tables, considerable educational benefit would result to the pupils themselves and to the Dominion as a whole. With reference to the work of the secondary schools, I would note first of all a tendency to attach too much importance to examinations. I realize fully the necessity of examinations and the benefit arising from them, but my experience leads me to the conclusion that they are often by no means a satisfactory test of a girl's ability. In this connection I would also protest against a pass in the three main branches of mathematics being compulsory for matriculation, as this regulation falls more heavily upon girls than upon boys. I would also advocate the granting of a partial pass in matriculation to a candidate who has gained passes in four subjects or in five, not including those which are compulsory. The partial pass granted in the corresponding examinations in Melbourne works very satisfactorily, and enables a girl to take higher work in other subjects, or to take up a fresh course while completing her Junior Public or Matriculation pass. The necessity of sitting again for examination in four or five subjects in which passes have already been gained entails some waste of time and serious educational loss. In the matter of the teaching in secondary schools, I am in favour of teachers specializing where possible instead of doing so much general teaching. A teacher as a rule obtains best results by working upon her own foundation, and no one is equally efficient in all subjects. It was once thought that any one was qualified to teach English, for example, but the more enlightened and advanced have now realized this to be a mistake. There is much room for improvement in the general teaching of this subject. One of the chief aims should be to instil a love and preference for reading in the proper way the best works of literature. This may be done by the introduction of the works of some of the best modern writers—*e.g.*, Stevenson, Kipling, &c.—and especially of the best specimens of historical fiction. Whole works should be studied rather than selections, and annotated editions, and more particularly those with extensive introductory criticisms, &c., should be discountenanced. Such editions render difficult independent thought and original criticism. In the Junior University Scholarship Examination, English should, I think, be at least as valuable as mathematics and Latin. History also should rank higher than at present, and certainly should be above science. The matter of making mathematics optional for girls is debatable, but I am rather for than against this proposal.

3. *Mr. Pirani.*] What is your opinion of the English of the girls who come to you from the primary schools?—I think they are deficient in the very points mentioned in the newspaper extract I read. I also think that their absolute ignorance of grammar is a serious drawback to their building up a more advanced English than they have already learnt.

4. What is your opinion as to their form and facility of writing?—I think the girls who have come under my notice this year are very much better in that respect than those of last year. Last year there were some shocking writers amongst the girls. It seems to me that more care should be taken.

5. Do you give any special instruction in your school in physiology?—Just the ordinary physiology, which is more or less elementary up to, of course, the matriculation standard.

6. Do you not think there is a necessity for a special course in a school like yours?—I do not think so. I do not think it comes necessarily under the work of a school-teacher.

7. Is there a need for a course in physiology by somebody specially qualified, say, for instance, a lady doctor, accredited by the Department?—I really have not considered the matter sufficiently to give a definite opinion. It might be necessary for some of the senior girls, but I would not strongly advocate it.

8. *Mr. Davidson.*] Do commercial subjects find a place in the curriculum of your school?—No. My opinion in regard to a commercial course is that I think, in one way, it would be a good thing if this course could be taken in the high-school work.

9. Do you approve, then, of the teaching of such a subject as typewriting or shorthand?—Not necessarily in the school—not unless there was a special technical course attached to the school.

10. *Mr. Pirani.*] Do you not think it would be better if, instead of having three institutions as at present, the boys in the Technical School were able to take the course at the Boys' High School and the girls at your High School?—I think that would be better, but it should be a complete course, and then it would have the advantage of a combined course. That is done at some of the new Government schools in Melbourne.

11. *Mr. Kirk.*] With what result?—One cannot judge it yet because it has only recently been taken up. The commercial course is not such a big course in the high schools there on account of the fact that so many business colleges exist throughout the city.

12. Is there time to teach the commercial course without sacrificing subjects that you consider more essential?—I do not think that course should be taken until at least two years' ordinary high-school work is done.

13. *Mr. Hogben.*] I suppose you would regard the primary purpose of the Matriculation Examination as forming the entrance to the University?—I believe, of course, that is the primary purpose, but I think the majority of girls especially rather regard it as a nice finish to their educational course.

14. Do you not think the University is justified in looking at it entirely from the point of view as an entrance to its own course?—If the University does, still I do not see that it is absolutely necessary to make three branches of mathematics compulsory. I would rather advocate

insisting on passing mathematics, Part I, as we call it in the arts course, than making mathematics compulsory in the Matriculation, because I think that is a disadvantage to the majority of the girls who enter for the examination.

15. When they are going on to the University?—No, not for the girls who enter for the University.

16. What is the use of sending boys and girls in for the examination if they are not going to enter for the University?—I think it is most desirable that girls, even though they are not going into the University, should have a standard to work to, and having matriculated they have a certain hall-mark of education.

17. Supposing instead of an examination you gave them a leaving certificate to be signed by an Inspector of the Department, based on a standard of work, would that meet the case?—I suppose that would have the desired effect. Of course, I have not got altogether into the New Zealand point of view with regard to university work. We do not have a Government examination in connection with the secondary schools on the other side. We feel that the university hall-mark is the one girls aspire to.

18. *The Chairman.*] Have you heard of girls coming from private and public secondary schools passing brilliantly in one course of study and failing in mathematics, thus being debarred from the special course of study at the university they want to follow?—Yes, I have known that to happen. The partial pass in the public examinations has counteracted that evil to a certain extent. I knew a girl in Melbourne who was delayed two or three years until she had passed one branch of mathematics that is necessary to enter the university there.

19. Are there any private secondary schools in Invercargill?—No.

20. Do you think it is desirable, in the event of such institutions being established, that they should be subjected to Government inspection in order to test the efficiency of the education at them?—Yes, I think there should be some test—say, registration of the school with an occasional inspection. The inspection need not necessarily be that conducted by examination.

21. Have you had any experience of primary-school work as affecting girls?—I have had no teaching, but I have come in contact with those who have.

22. The claim has been put forward by some of your sex that the girls, at a certain age, should be taken out of the primary schools where they are being taught by men and should get a special class of instruction: have you considered that point sufficiently to give an opinion on it?—That is rather a debatable question. I do not think it will be settled for a long time yet. In Victoria at most of the high schools and continuation State schools that have been established by the Government the boys and girls are educated together. I have had some experience of the girls. They used to play hockey and cricket matches with teams from the college, and it seemed to me that the relations between the boys and girls at these matches were such as not to make one want to support co-education. There seemed to be some roughness and familiarity, but I think that is now being improved to a great extent. Some teachers are strongly in favour of co-education, but they all find it necessary to be very strict, and I know in one school in Ballarat none of the girls are allowed to attend the boys' matches and none of the boys are allowed to attend the girls' matches.

THOMAS DAVID PEARCE examined on oath. (No. 69.)

1. *The Chairman.*] What is your position?—I am Rector of the Southland Boys' High School, and I have been in that position for the last eight years. I have been teaching for twenty years. Before coming here I was English master in the Nelson Boys' College and in the Otago Boys' High School. I am a Master of Arts of the New Zealand University, with first-class honours in English and Latin.

2. Do you wish to make a statement in regard to the subject-matter of our Commission?—Yes. I may say I have studied my profession from the scientific aspect, being well acquainted with the literature of teaching. Beginning with our primary schools, I should like to insist at the outset on their foundational function in education. There we lay the broad basis on which we build the whole superstructure. We may add story after story on a broad, solid foundation, but not on a poorly laid, thin foundation. Any architect will tell you that. The question then arises, Is our foundation solid? I am of opinion that it is not as solid as it should be. Instead of solid concrete or stone, it is more of the nature of the loose and uncemented. Too many elements are in it; it lacks the simplicity that goes with solidity. The old saying was that primary education consisted of the three Rs—reading, writing, and arithmetic. And if we liberally interpret these, we must see that it always must be so. Under "reading" I embrace grammar, composition, spelling, memory-training; and I include drawing with writing. History and geography may be added as necessary fact lore for the true comprehension of our world, physical and political, and for an easier comprehension of allusions and references in general literature. I consider that these are the basal elements. To these in recent years have been added woodwork and cookery, elementary science and agriculture. Now, in summoning me here you wish to know how I find the primary-school product as it comes into my hands. On the whole, I find the boys intelligent and well-grounded in their subjects, so far as their time-tables go. I believe the primary teachers are doing faithful and conscientious work. The smarter boys are good at arithmetic, although this is less is compass than it was fifteen years ago. They read intelligently, have a good knowledge of geography, and some elementary science. Where they fail is in knowledge of history, in grammatical sense, and in knowing how to learn. In history I attribute their ignorance to using historical readers and to a failure to assimilate the groundwork of the history. I do not mean that they should have a knowledge of detail, but that they should have a historical sense. For instance, I find that boys do not know in what century the Hundred Years' War was, in what century the English Reformation was, the Civil Wars, and

so on. I think pupils finishing the primary stage should have general ideas of history, sufficient to act as guide-posts for them. I am pleased to see that history has been made compulsory for the D certificate. In grammar, or the absence of it, I find in the secondary school the greatest handicap. The syllabus lays down that the functions of words should be known, but discourages the use of technical names. From my talks with primary teachers I find that they themselves experience the greatest difficulty with this subject. I further find by inquiry from pupils that in many schools no grammar text-book is used. That, I think, is where the mistake lies. The function of words is not taught fully enough. The consequence is that on their arrival at the High School there is great difficulty in learning a foreign language such of French or Latin. It is some considerable time before the grammatical sense so necessary for composition is developed. I should advocate more attention to the elements of formal grammar, with the use of grammatical terms, in the Fifth and Sixth Standards. Then, generally speaking, there is a marked difference in pupils in knowing how to set about the learning of anything. I am a believer in home-work, written and memory. You cannot progress in secondary subjects without exact memorizing. Spade-work has to be done; without it there is no harvest. Boys who come from schools where home-work is not set make the poorest progress; boys from schools where home-work is set, the solidest progress. Home-work develops self-reliance, perseverance, and industry. Lastly, I think that manual work is introduced far too early. Children of the Fourth Standard are not old enough to appreciate woodwork and cookery. I have no objection to these subjects if they are viewed as embellishments and accomplishments; but I think it a mistake to view them as foundational work. I should prefer to see them relegated to the stage of education succeeding the primary. I should prefer the time now spent on them to be spent more profitably in more grammar, more literature, more arithmetic, even more writing. If you take away time for these subjects, then there is less time for the foundational subjects, reading and arithmetic. As regards scholarships, I have formed the opinion that the allotment of scholarships of the value of £5 to town scholars is a mistake. There may be deserving cases, but in my experience they are few. I consider the money would be better spent in the provision of scholarships for country boys, thus aiding them in their desire for further education. There is another aspect of scholarships to which I should like to refer—that is, the desirability of more Senior Scholarships. Parents willingly allow a boy two years at a secondary school; the difficulty comes afterwards, when a boy has arrived at the age of sixteen, at a wage-earning stage, and clothes and books cost more. Then the pinch is felt, with the consequence that then the removals are made. Then our system does not seem to get a return for the money invested. There is the breakdown, so that the upper department of a secondary school is thinner in numbers than it ought to be. Of course, many must leave for work, but more might be induced to stay if there were ample provision of scholarships. Take the Southland District, for instance. For the whole of it only two Senior Scholarships used to be given; then three, and then four; and at the present moment there are five. But these four and five were made possible only because they all happened to be town children. Five or four could not be given if two Senior Scholarship holders happened to be non-resident. Of course, it is a question of the allocation of the money. What I say would be better for our system would be abolition of Junior Scholarships, and a utilization of that money for boarding scholarships and for more Senior Scholarships. Overlapping exists, so far as I am aware, at one point in our system—*i.e.*, between the so-called day technical schools and the high schools. There is little difference between their time-tables and subjects of instruction, and as the day technical schools were born last, they are the guilty parties in this overlapping. Day technical schools ought to be preeminently vocational in their courses, attempting nothing but technical subjects. Then their existence in our educational system would be warranted. Shorthand, typewriting, commercial correspondence, book-keeping, handwriting, Customs' tariff work, engineering, carpentering, and so on, should be their subjects. Then there would be no overlapping. But as it is they teach English literature, mathematics, and so forth, as in high schools. I venture to say that these technical schools owe their existence solely to the conflict of authorities. I mean that were one body administrating education in a district that one body would not countenance overlapping by unnecessary expenditure on buildings, salaries, and maintenance, when the mere addition of two specialists to the high school staff would achieve their object. Besides I do not think day technical schools are at all warranted outside of the four large towns. We are too ambitious for our small population. I take the opportunity to lay before the Commission a difficulty. All high school boys that are able-bodied are *ipso facto* Senior Cadets. The Defence officer demands that there shall be six half-day parades in the year. I have no objection to that, I approve of it; but I should like to be helped to carry it out. The Education Department arranges with the Railway Department for the latter to carry all pupils attending secondary schools free of charge on school days. But is will not carry them free of charge on a few Saturdays, even although the school requires their presence, because it is interpreted that drill and shooting are not subjects of "tuition." In this district there is only one afternoon train outwards, and that leaves a few minutes after school closing-time. The consequence is that I have to encroach upon the school lesson-time for these half-day parades. You will naturally understand that teachers begrudge doing this, when this drill and shooting practice could very well be taken on Saturday mornings. All I ask is that on six Saturdays in the year I could be allowed to bring my country boys into town on their ordinary free pass. I have several times approached the Defence and Railway Departments in vain. All that is required is an arrangement among the Defence, Education, and Railway Departments in Wellington, by which the word "tuition" in the Railway Regulations is interpreted to include drill and shooting. As the shooting and drill practices are in conformity with the State requirements, I consider the request a reasonable one, and I hope to see it recommended by you and ultimately attained.

3. *Mr. Wells.*] Do you feel able to make any comparison between the output of the boys of the primary schools now and eight years ago?—I think, if anything, they were a bit better.

4. You think a boy has less resource now in attempting new work than fifteen years ago?—I do.

5. Would you make any allowance for scholarships in the towns to cover the cost of books?—Here and there you will find a deserving case where that £5 is of assistance, but the great majority of them do not require it.

6. Five pounds would not much more than cover the cost of books?—No. A boy's initial expense in the matter of books in entering a secondary school is about £3.

7. Still, you would not, as a general rule, supply the books?—No, I find the parents are quite willing to make a sacrifice to enable their boys to attend the secondary schools. The difficulty comes when the boys arrive at the wage-earning stage after the two-years course. I would rather cancel all Junior Scholarships and put the money into Senior Scholarships to retain the boys longer at the schools. My difficulty in this non-university and growing commercial town is to retain the boys.

8. *The Chairman.*] If the books cost £3, why pay £5 even in deserving cases? Would you favour, in such cases, giving a sum sufficient to cover the cost of the books?—Yes, in deserving cases.

9. *Mr. Kirk.*] As the State's corrective school discipline ends just at a time when the life of the boys and girls is changing, is it your opinion that some system of compulsory continuation classes should be made general in order to keep their minds employed?—I am strongly in favour of compulsory continuation classes up to eighteen years of age.

10. Has anything come under your notice as a teacher to justify the teaching of sexual physiology in the schools?—Yes. It is the complete indifference of the parents. Some six or seven years ago I introduced into my school in confidence to the boys a little book by Bisseker. Bisseker is a Master of Arts and a residential master in one of the big schools in England, and he has published this book with the sanction of the British Medical Association. I have fifty copies, and once a year I give them to each class and allow the boys to read it, after which they bring it back to me. I make no comment on it. It is a most difficult subject to deal with. I may say that Mr. Blyth, who has visited us from time to time, treated the subject in the most tactful manner indeed.

11. Do you think the subject can be advisedly taught to pupils congregated together?—The general principle can be explained. The complete ignorance of some of the boys is the trouble.

12. Is it not rather a matter for personal interview with the boys?—I do not think so. Mr. Blyth is very strong upon a personal interview, but I differ from him on this point. I am certain this is a subject you cannot ask any and every man to tackle.

13. Have you any remarks to make as to the Inspectors' examinations of the secondary schools?—No. I have always welcomed the Inspectors, and they have always treated me well.

14. As to the amount of examinations generally: do you think they are overdone, or do you think they are sufficient and reasonable?—The antidote to over examination-work is indulgence in physical exercise, and as far as I can I make the boys play cricket, football, fives, and so forth. My best results have always been achieved by boys who have afterwards taken the leading prizes in athletics as well as in their subjects at the University.

15. We had some evidence in Dunedin as to cramming in connection with Junior Board Scholarships: I would like your opinion as to whether there is any cramming in connection with these scholarships, and, if so, whether it is necessary?—It is certainly unnecessary. For instance, my boys go up for the Senior Board and Junior University Scholarships, and we never do any extra work. It is all a matter of organization of the tuition in the course of the day.

16. *Mr. Poland.*] Do you think that without any special preparation of the boys in the primary schools for the Junior National Scholarship the brightest and best pupils in the district will obtain these scholarships?—Certainly. I think it is a great mistake to have extra work. I have a girl of my own in the Sixth Standard at the present time. A class was started before school for preparation for the scholarship-work, and Mrs. Pearce and I soon saw the distress of the child, and we immediately took her away from the preparatory class. She has been all the better ever since.

17. Is she still a candidate for the Junior Scholarship?—I suppose so. I am certain she will do much better in the examination because of abstention from that class.

18. Do you teach any special vocational course in your school?—I have a commercial course. I insist on a boy taking one foreign language. I do not think any secondary-school course is worthy of the name unless a boy learns a language other than his own.

19. Do you think there is any overlapping in regard to the commercial course between your High School and the Technical School here?—On a rearranged Matriculation course I should be very glad to banish any commercial work from our schools.

20. *The Chairman.*] Do I understand your deliberate opinion is that the primary-school course and the manner in which it is interpreted and carried out does not afford a sufficient basis for a proper secondary education, that the children do not come prepared in the essentials in the manner in which they did fifteen years ago?—I would not put it that way. I think their time could be more profitably devoted in the primary stage to what I call foundation work.

21. If the boys were grounded in these fundamentals would the material you are working on be better than it is now?—Yes. I think the main point is the difficulty with which they attack new work. I do not think the boys of fifteen years ago had as much difficulty, because it seems

to me that home-work was more general then and their training of memory was better, and they had a grammatical sense which the boys of to-day have not.

22. Do you regard civics as an important part of primary-school teaching?—No, I do not. I regard it as valuable in a general way. It brings them into touch with their community, but I would not lay much stress on it.

23. If the boy or girl who cannot go to a secondary school is to do intelligent duty as a citizen in after-life how is he or she to get knowledge of the empire to which they belong unless they receive instruction somewhere?—You instruct them in their civics in the primary stage in the continuation schools.

24. Where are those who do not go to the secondary schools or continuation schools to get it?—It is certainly desirable they should have some elementary civics, but it could easily be worked in connection with English in the primary schools. You need not make it too ambitious.

25. In regard to boys not being able to get sufficient time to drill, has application been made by your Board of Governors to both the Railway Department and Cabinet for train facilities?—I hold a commission as Major, and I have interviewed General Godley in regard to the matter of allowing my country pupils to travel on their railway passes on Saturday to town to attend drill, as that is the only time when they can be drilled properly. General Godley is quite in favour of the proposal, but nothing has been done. Apparently when these things get to Wellington they are apt to be pigeon-holed.

26. Would it not tend to a great improvement in their drill and shooting if the boys had a special concession to travel on Saturday?—Yes. As it is the train arrangements do not suit on any other day of the week, with the result that the drill has to be rushed through in the dinner-time.

27. What you plead for is a common-sense view of the regulations, and not a red-tape one?—Yes, I plead for the general utility of the State. This is a matter between the Railway Department and the Defence Department. This district is peculiarly situated in regard to its train arrangements.

28. I understand the train arrangements are not such as would enable this instruction to be given, and the boys to return to their homes within a reasonable time on any day but Saturday?—That is so.

William Macalister examined on oath. (No. 70.)

1. *The Chairman.*] What is your position?—I am a barrister and solicitor. I am a member of the Southland Education Board, and also chairman of the Board of Governors of the Southland Boys' and Girls' High Schools. I was for fifteen years connected with the administration of education in this district, but during recent years I have not been so closely in touch with it as formerly.

2. *Mr. Wells.*] Is the control here of primary, secondary, and technical education under one body?—The Education Board does not control secondary education. I may say that some years ago I was in favour of amalgamating the two bodies controlling education. I do not know that I am in favour of it now. I find that the work, by reason of the introduction of technical education, has been increased so much to the Board that I am doubtful whether the Education Board could efficiently undertake the control of secondary education in addition to the work it is doing at present. It might make for economy, but I do not know that it would make for efficiency.

3. A good deal would probably depend on the local body?—No doubt. Of course, here in Invercargill the administration of the high schools is economical. By arrangement with the Education Board we have the use of the Board's office and Board-room, and the Secretary of the Education Board is also the Secretary of the High Schools Board, so that there is not much to be gained even on the score of economy by amalgamation here, and I do not think there would be anything gained in the way of efficiency.

4. Can you offer any suggestion as to where economy could be effected without endangering the efficiency at all?—Not with the continuation of the present system. It seems to me that economy might be obtained by creating a central Board or Council of Education to control the administration of education—that is, not the actual local matters, such as repairs to schools, &c., but the actual work of administering education might very well be controlled by some central body.

5. You would approve of that?—Yes, I would. The same idea occurred to me years ago. I know that members of Education Boards are opposed to any interference whatever with the powers of Education Boards, and they resent and have resented any interference on the part of the Department. I have never taken that view. I think that education is a matter of national concern, and Education Boards are not local bodies in the sense that other public bodies are. So far as the administration of the affairs of this town is concerned, there is no community of interest whatever with Dunedin or Auckland; but so far as the administration of education is concerned it is of interest to the whole of the Dominion. In that sense Education Boards are not local bodies administering local affairs. Education is a matter of national concern. It should be a national system, and I do not see how such a system can be controlled by local Education Boards. I do not approve of centralization, but I have always sympathized with the Department on occasions when they have interfered in matters with which this Education Board has claimed to be its own concern. I know if I were head of the Department I would be strongly tempted at times to interfere. I was asked whether I could make any suggestion in the direction of economizing the administration of education. I do not suggest the abolition of Education Boards, because there should be some local Board of advice; but I think the administration of education—that is, the actual work of education—ought to be controlled by one central Board, and if that were done it would make for economy.

6. *Mr. Thomson.*] What is your opinion of a Dominion scheme for the promotion of teachers?—It would be an advantage to have such a scheme, but it cannot be done under the present conditions.

7. Would you believe in centralizing the Inspectors?—Under certain conditions.

8. *Mr. Pirani.*] If there was a central Council of Education, consisting of experts in education, expert administrators, and so on, governing, with the Department, the system of education, and if under that there were, say, four Education Boards or bodies for the whole of the Dominion, and under those Education Boards there were School Boards for each district, giving to a district, say, fifteen to twenty schools, primary, secondary, and technical, and with it all there was a system of classification and promotion of Inspectors and teachers, do you not think that would be a better and more comprehensive government of education than the present system?—It would, but it would not be so comprehensive as the one I suggest.

9. *Mr. Davidson.*] Do you know of your own knowledge whether there are many unnecessary small schools in this district?—I do not think there are any that are unnecessary.

10. Do you not think that many of these small schools might be closed and the children brought to a consolidated central school?—Yes, that might be done, but not under the present scheme. No doubt, if ample provision was made for bringing the children to a central school it could be done.

11. Do you not think it would lead to greater efficiency?—Yes, I think it would.

12. Do I understand that you would advocate the nationalizing of the system in reference to the training, appointment, and promotion of teachers, and the inspection and examination of schools?—Yes. My fifteen years' experience on Education Boards leads me to say so emphatically. I am strongly in favour of nationalizing the whole system.

13. If the system was nationalized, I take it you would leave the local control to the School Committees?—I do not know that it could be left to the School Committees as at present constituted. There would have to be some local control, either by a School Committee or a School Board.

14. You advocate the nationalizing of our system as distinct from the parochial form of government as at present?—I do. I do not know that there would be any justification for four Boards. Why have four? I should say that one would be sufficient.

16. *The Chairman.*] Do you not think that a Council of Education would tend to a continuity of policy?—Yes, I do.

EDITH ANNIE HOWES examined on oath. (No. 71.)

1. *The Chairman.*] What is your position?—I am second assistant in the Gore Primary School. I have been thirteen or fourteen years in the service of the Southland Education Board, and before that I taught in North Canterbury for about seven years. For some years I have given earnest thought to our system of primary education, looking for the causes of its unsatisfactory results. It seems to me that three great mistakes are being made, and that real education can never be achieved till they are rectified. The first and most mischievous mistake is understaffing. In spite of recent partial reform, classes are still far too large. I would venture to say that no teacher, however capable, can hope to really educate more than thirty children at once—twenty to twenty-five would be a much more ideal number—but throughout our bigger schools we have classes of forty, fifty, sixty, and even seventy. In so large a class the work becomes mob-teaching, not education. The correcting and marking of work, the giving out and collecting-in of material, all the mechanical part of the work takes up far too much of the day. It is impossible to find the time for enough individual effort on the part of the children, individual reading, speaking, questioning, and answering. To get through the allotted work the teacher must do most of the talking, the children meanwhile losing the interest and the self-reliance which come from personal effort. Besides this, there is in any big class a most marked unevenness of brain-power. In a class of fifty, there will be about ten at the top who for the greater part of the year are only marking time while they wait for the rest; at the bottom there are another ten lagging behind. The medium majority claim all the time there is; the teacher cannot cope with the two extremes. Those at the top lose interest; those at the bottom lose heart. Worst of all, the earnest teacher feels keenly that the rush of work and the continual straining of discipline inevitable in a big class prevent that close personal touch, that knowledge of the individual child and interest in his character which could be made the most potent factor for real education. Big classes produce alienation. The second mistake is made wherever two classes, under two teachers, are in one room. And that condition obtains widely. The distraction is tremendous, both to children and teachers. Concentration is almost impossible. Grown people could not do what we are forcing upon little children—could not concentrate on arduous mental work while half a hundred children beside them read aloud or repeated numbers. The nerve-strain is terrific, and a real hindrance to effective work. The third mistake seems to me to be that the children are given too much mental work at too early an age. Ignorance of child-development is partly the cause of this. We have not yet sufficiently realized that doing, not thinking, is the child's natural expression of himself; that if we would not overstrain the little developing brain we must lead gradually up to abstract thinking through eager interest in delightful doing. But here again comes in the stultifying effect of big classes. Doing means room to move—floor-space—which is not available. A class of fifty is too unwieldy for outside work—real nature-study becomes an impossibility; it is too unwieldy for any kind of manual work. A teacher may stand and hurl ideas at fifty listening heads, but she cannot competently direct the work of fifty pairs of untrained hands. So the work is necessarily almost limited to the mental, and for five hours or more each day for nine long years the children sit at brain-work. Most grown people feel such a record a pretty severe strain; the effect on children, suffering doubly through physical

suppression at the age of greatest physical development, is a brain-fag which sends them from school utterly weary of education. So we turn out our young people untrained in habits of self-reliance and initiative, and too tired of learning to be keen on that self-education to which school life should be but the prelude. Of course, more liberal staffing means greater expense, but perhaps there are ways in which economy could be effected. An extension of the van system seems one. Teachers in charge of ten or twelve children in the backblocks could teach twenty or twenty-five in a centralized school. But even though better staffing should cost considerably more, it is surely worth while, if it makes a success of what is at present spoken of as a failure. Most persons are agreed that no better investment of the people's money could be found than true education. If the results were satisfactory, the grudging of the cost would probably cease. For full staffing, again, we need more teachers than we have offering at present. To attract teachers to the profession we need higher salaries, the pleasanter conditions which would result from smaller classes, and more training colleges.

2. *Mr. Wells.*] Have you had any experience of kindergarten work?—Only what we have tried in the infant classes, and on the account of the big classes they are a failure. The schools are not built for kindergartens; they are only built for cramming children in and making them sit still.

3. Do you think the kindergarten should be incorporated with the public-school system?—I think so, decidedly, if you have enough teachers and enough room. But as things are at present kindergarten work could neither be incorporated as lower classes, nor the principles carried through the classes as we have them. It seems to me that the kindergarten idea could be carried up much further than it is at the present time if we had room and the qualifications.

4. Are not teachers trained to kindergarten methods?—Yes.

5. Under present conditions, at what age do you think children should be admitted?—I really do not know that I have thought that out; but children of five years are too young to learn what they are expected to learn now. I feel that if they begin at seven years of age they learn as much in their first year as the majority of children beginning at five have learned in those two years. They learn more. A child beginning at seven can go through four classes of the infant-room in little more than a year. The ordinary child beginning at five years of age takes three years to go through those classes.

6. What is your idea of teaching cookery as part of the school-work?—I think it is an excellent idea. I have not met a girl yet who is not enthusiastic over it. Every subject that brings an interest into school life is a big help.

7. You spoke of the smarter children marking time: have you any suggestion to offer, other than the appointment of more teachers, to get over the difficulty?—I do not see any other.

8. We had the suggestion in Dunedin that in the large cities the fourth, fifth, and sixth classes should be grouped in two or three schools, thus enabling more division to be made?—That would be an improvement.

9. Do you think there would be any loss to the other schools in losing these standards?—There might be, but I think there would be a counterbalancing advantage on account of the interest given.

10. You have published some works dealing with nature-study for children?—Yes.

11. What is your opinion of the syllabus regarding nature-study, and of the syllabus as a whole?—It seems to me that arithmetic and nature-study open up the minds of the children better than any other subjects. The abstract subjects are not dealing with the real things of real life, but nature-study is the one thing of all which links the child to real things. I have for years tried to carry out nature-study very fully, but with the size of the classes I have I find it cannot be done as it should be done. You cannot get the children outside, and you cannot get enough material to go round a big class. Nature-study is impossible under present arrangements, and it seems to me that that is one of the great wants. With regard to the syllabus generally, I have not gone through the work of the other standards, and so am not competent to speak.

12. *Mr. Pirani.*] What is your ideal number of children one teacher ought to have under her control: I suppose half a dozen would be an ideal number?—No, that would be too small for enthusiasm and competition. Fifteen to twenty, I should say.

13. Have you any idea of what that would cost?—I suppose a tremendous amount.

14. Would you be prepared to contribute your share of the cost in direct taxation, if you were asked to?—I suppose every one who was really in earnest in the matter would.

15. Is it not a fact that one teacher can teach more children than another?—That is so, but I have not yet seen the possibility of a teacher teaching more than thirty successfully.

16. Do you think the more pressing need is more teachers per school rather than that the teachers should have more salary?—From the point of view of the welfare of the children, yes; but unless you pay salaries I do not know where you are to get them.

17. Do you know of any positions open to ladies giving better salaries than ladies can get in the teaching profession?—Yes, I think so. If the time put into study was put into dressmaking I think a girl would do better.

18. Probably there may be a hundred picked positions, but excepting them, what is the ordinary pay of a dressmaker's assistant?—I do not know.

19. Do you know of any position in the teaching profession starting at 5s. a week?—No.

20. Do you know any number of dressmakers who can get more after five years' dressmaking than a teacher can get after five years of teaching?—I do not.

21. There are three thousand teachers in the Dominion: is there anything you can compare for a moment in general with the pay of teaching, considering holidays and superannuation?—You have not counted in the nerve-strain, which is greater than any other.

22. *Mr. Thomson.*] Do you recommend the establishment of more training colleges?—Yes.

23. Do you not think it would be better to have local training-schools?—I think that would be better. The only thing is that the pupil-teachers are experimenting on the children, who are suffering from their teachers' want of knowledge.

24. What about the normal school, where the children have to take several new teachers in the course of a day?—They are teaching under direction.

25. They must be experimenting on the children?—Yes, but under direction.

26. *The Chairman.*] Is it not a fact that every student is under the direct training of a teacher?—Yes.

27. *Mr. Thomson.*] How, then, do you account for the number of excellent teachers in Southland who never went to a training college?—They got that by experience; but how about the children they experimented on?

28. *Mr. Davidson.*] What is the average attendance of your school?—461.

29. If the staff is materially increased when the new scale comes into operation, that difficulty you mentioned about understaffing at Gore will to a large extent disappear?—Certainly.

30. Have you ever considered the desirability of promotions of children taking place every half-year, instead of every year as at present?—That would be an advantage if there was room to put them into the other classes. I have thought of it, but it does not seem to be very feasible.

31. Have you tried dividing classes into the senior and junior division?—I do so invariably.

32. That to some extent prevents the retardation of the clever pupils?—Yes.

33. Would you recommend laying down a definite course in nature-study, or would you advocate the teaching of nature-study in correlation with reading or any subjects that lend themselves to that work?—I agree with the correlation to a certain extent, but it can be overdone in making it too rigid to be worked under certain circumstances.

34. I mean that the teacher should be allowed to correlate with any of the subjects that lend themselves?—I am in favour of that.

35. *Mr. Hogben.*] Would you understand that a definite course in nature-study precluded correlation with other subjects where it is possible?—No, I do not. I am a little in doubt as to what "correlation" means in this connection. I work with a definite course of nature-study, and correlate too.

36. You think the syllabus allows that?—Yes.

37. *Mr. Davidson.*] Would you have on the time-table a definite period for nature-study?—Yes, otherwise it would be apt to be left as a subsidiary thing.

38. In addition to having a definite period for nature-study, you would also correlate with the teaching of other subjects?—Yes. It makes those subjects much more interesting.

39. *The Chairman.*] I take it it is your experience that it is only fair to the teacher to have smaller individual classes?—Yes, to the children and teachers.

40. Do you think it would be an advantage if kindergarten work was given to children of tender years, and also formed part of the State-school system of New Zealand?—Yes.

JOHN NEILL examined on oath. (No. 72.)

1. *The Chairman.*] What is your position?—I am Secretary of the Southland Education Board, and have been so for twenty-seven years. I was teaching for thirteen years before I became Secretary.

2. Have you prepared a statement?—I have made some notes for the purpose of bringing certain matters under the notice of the Commission. My notes are somewhat brief, but I shall be glad to answer any question the Commissioners may put to me. (1.) Powers of Boards: In making appointments of teachers Boards should have almost absolute power. This Board's regulations, adopted in the year 1898 (copy attached), were to my mind almost, if not quite, the ideal. In the regulations referred to provision was made for consultation of School Committees by throwing on them the onus of showing in what respects a teacher selected by the Board for a particular vacancy was not the best qualified or most suitable applicant. These regulations, I have good reason to believe, were adopted in the very best interests of all concerned, and under them I believe more satisfactory appointments were made than has been the case either before their adoption or since they were superseded in 1902. Moreover, I am convinced that a very large majority of the more intelligent School Committees and teachers highly approved of them. (2.) Amalgamation of local governing bodies: It seems to me that there is no reason why the Education and High School Boards should not be amalgamated, and every reason (both financially and otherwise) why they should. The day is past when it may be considered that there is any conflict between the interests of primary and secondary education—rather is it now considered that the one is but the recognized complement of the other. There seems, therefore, no adequate reason why the same set of men should not control and the same set of officials administer the affairs of both primary and secondary education throughout the Dominion. (3.) Finance of Boards: The introduction of a colonial (Dominion) scale of salaries, while recognized as a most beneficent measure in the interests of teachers, had the effect of restricting the powers of Boards in the matter of regulating their general finance. By this innovation practically three-fourths of the revenue of Boards was, so to speak, earmarked, and I think rightly so, in the interests of those most concerned. Now, under the altered conditions the Boards are restricted in their financial operations within the limits of the grant (12s. per pupil) for the purposes of administration, and even in this restricted sphere by a departmental regulation requiring that at least 5s. 6d. of the total grant of 12s. shall be paid over to School Committees. There is thus but a sum of 6s. 6d. per unit of average attendance in any given district over which a Board may be said to exercise absolute control. It seems to me that something more might be done to

equalize the financial responsibilities of large and small education districts. It is obvious that in education districts where there is a large average attendance in proportion to the number of schools, and where relatively the cost of administration is less than in other districts where the existing conditions are not so favourable, the consideration of "ways and means" must prove a somewhat difficult problem for some Boards to solve. I am, of course, aware that this condition of matters is somewhat ameliorated by the special grant of £250 per annum made to all Boards (large and small alike); but even this concession is, in my opinion, not enough to place all Boards on an equitable footing financially. (4.) Franking privileges: I respectfully direct the attention of the Commission to what happened several years ago in the withdrawal of the franking privileges previously enjoyed by the Secretaries of Education Boards. I do not complain of the abolition of such privileges—quite the contrary—I believe that the change thus brought about was decidedly in the best interests of the State; I do say that some equivalent advantage should have been bestowed on the public bodies interested whose functions are purely administrative. The change meant to this Board an average increase of expenditure equal to £104 to £120 per annum since the change was introduced, with no corresponding increase of revenue. (5.) Free class-books: In my judgment the introduction of the scheme for the supply of free class-books to pupils in public schools was a mistake. There was no public demand for the privilege from even the poorest in the community, and neither do they now to any extent take advantage of the concession. It is a notable fact that probably from 75 per cent. to 80 per cent. of the parents purchase at least all the reading-books required by their children, with the result that the free class-books so generously supplied by the State are to a very considerable extent unused. From a hygienic point of view alone the principle of providing books for the indiscriminate use of all the pupils in any school is objectionable. I should say that at least one-half of the money spent in providing free class-books is as good as wasted. If the object desired be to lighten the burden of parents of large families and of only moderate means, then that object could be as easily attained by supplying all exercise-books, writing-tablets, drawing and copy books, and other miscellaneous stationery required by the children—all of which would in effect perish in the using. The wisdom of this suggestion has, indeed, already been recognized by the Department in its circular of instructions issued at the close of last year, whereby is permitted the subsitution of grants for the purchase of stationery in lieu of certain class-books to be provided by the parents. It only requires an extension of this principle so that it might apply to all classes and to all text-books. With certain exceptions, in the case of parents who may be too poor to afford to purchase a full supply of books, and which could easily be provided for, I am strongly of opinion that the grant for the supply of free class-books as at present administered should be diverted to other and more useful purposes. In this connection—that is, the substitution of stationery for class-books to be purchased by parents—I direct attention to the conditions under which such substitution is allowed—viz., that the amount provided by the Department will only be paid on condition that the School Committees—that is, the representatives of parents—contribute an equal amount. If the object sought to be attained by providing free text-books is relief to the individual parent, then the Committee should certainly not be expected to contribute to the cost of such supplies, the only feasible method (with their very restricted income) by which they (the Committees) can contribute being by making a call either directly or indirectly on the parents of pupils, thus in effect nullifying to some extent the advantages which the system is intended to bestow. (6.) Scholarships and free places: In my opinion the present system of awarding scholarships should be abolished, and all money payments withdrawn except such sums as will provide for the approximate outlay for text-books for the use of the successful candidates gaining over a certain minimum number of marks at the examination. I do not, of course, advocate the withdrawal of any portion of the present expenditure on scholarships, but rather the application of the surplus thus set free to the assistance of successful country candidates who have to travel by public or private conveyance (other than the railways) to enable them to attend the prescribed secondary school. An adequate allowance for board for the forty weeks of the school year should be made to all scholarship pupils requiring to reside away from their parents' homes whilst pursuing their more advanced studies at the secondary schools. I suggest that the granting of free places in secondary schools to all pupils passing with proficiency the Sixth Standard should be regulated by some restrictions other than a mere age-limit. In many instances the free place is surrendered before the expiration of the period for which it was granted, with the result that the pupil has received but little benefit from the instruction given at such a cost to the State. A free place should be awarded only to those who are prepared to undertake a course of at least two years, and withdrawal should only be permissible under exceptional circumstances as to failure of health or for other adequate excuse. (7.) Teachers' salaries: A minimum salary of at least £120 per annum should be paid to all male certificated teachers in the service, irrespective of the position held. I hold strongly that some differentiation of salaries as between married men and single men should, if possible, exist, as also between male and female teachers after a certain reasonable limit of minimum salary has been reached. In saying this I am aware that I enter upon debatable ground, but I hold the opinion that the regulation in operation some years ago, whereby (after reaching what was then considered to be a living-wage) a differentiation in the increment of salary granted each year as between male and female salaries was only a just provision in view of the inequality of the social and other obligations of the sexes. In conclusion, I may say that there are many other phases of the educational problem on which I might have touched, but consideration for your Commission, as also the fact that others have dealt more or less exhaustively with the points to which I might have referred, forbids that I should further trespass on the limited time at your disposal. It is unnecessary that I should say that I shall be very pleased indeed to answer any questions

which members of your Commission may feel disposed to ask, or in any other way to facilitate your inquiry into the educational interests of the Dominion.

3. *Mr. Wells.*] Do you think economy might be effected and greater efficiency secured by the amalgamation of some of the smaller education districts that at present exist?—I certainly think so.

4. Have you thought at all whether any simplification might be effected as regards the returns that are required?—I think a good deal could be done in that direction. I have brought with me a few returns such as we are asked to compile quarterly. One is a statement of the numbers of pupils attending the public schools, with their ages, respective standards, and so on. It seems to me that for statistical purposes if such a return were compiled once a year it would be quite sufficient. It takes at least thirty pages of ordinary foolscap to compile the figures required for this return. It seems to me all that work is unnecessary. There should, I think, be a separate report for the first three quarters, and if this full return is required it should only be for the December quarter.

5. The omission of that would mean a considerable lightening of the office-work?—Yes, but it would lessen the work of the teachers to a greater extent, and it is they who have to furnish the quarterly returns. The return which the teachers have to supply us quarterly entails upon them a lot of unnecessary work, I think.

6. Can you make any suggestion for the simplification of the work?—That depends entirely upon the exigencies of the Department. The making of returns so far as the attendance of pupils is concerned is necessary owing to the fact that the teachers are paid on average attendance.

7. Are there any other returns which pass through your hands?—Yes, a number. There is the annual return, for instance, giving the names and salaries of teachers. It seems to me it would meet all requirements if we were required to furnish the number of schools in each grade and the aggregate salaries paid to the teachers of the schools in that grade. Of course, we should have to get the information, but it would not be necessary to forward this very formidable return. I do not see that there is much to be gained by it, because, after all, the names of teachers is a matter for the Boards, and cannot very well be gainsaid by the Department.

8. Can you suggest any means by which we could get greater economy without impairing efficiency of administration?—I do not know that I have sufficiently studied the subject to answer the question. I think there are directions in which economy could be effected, but one would require to go into it carefully.

9. *Mr. Kirk.*] In connection with these returns it necessarily follows, I take it, that if the returns are cut down there must be a saving in the office of the central Department so far as checking is concerned?—I should think so.

10. What have you to say as to the relations existing between the Education Board and the School Committees in this district?—They are entirely harmonious. During the last twenty years I do not remember anything approaching serious friction, even at times when friction might have been anticipated.

11. Are the School Committees carrying out the functions required of them?—I think they are to the best of their ability in nearly every case.

12. Are the school buildings being fumigated?—Wherever an outbreak of typhoid or other disease has taken place the schools are fumigated. The schools as a whole are not fumigated regularly.

13. Do you not think it would be wise on the part of the Committees to have them fumigated regularly?—Perhaps it would. Some of the schools do fumigate during the holidays after each term. I think it should be done every quarter or half-year at all schools.

14. *Mr. Poland.*] You are, I understand, Secretary of the High School Board as well as the Education Board?—Yes, I have been for six years Secretary of the High School Board.

15. Do you think one Board could successfully undertake the control of the primary schools and the technical school in this district?—I believe if a small sub-committee were appointed it could be done.

16. Do you believe one control would work in the direction of economy and tend to prevent overlapping?—It would certainly have that tendency. If any overlapping occurred it could be more readily seen and checked.

17. *Mr. Thomson.*] Do you think a saving would be effected by reducing the number of returns required by the central Department?—Well, I do not think there would be any great saving in the cost of education, but there would be a saving in the labour involved in the preparation of those returns.

18. What was the credit balance of the Southland Board of Education for the year 1911?—About £7,000.

19. Against that what were the liabilities?—There were large liabilities in respect of buildings and other things.

20. Of that £7,000 is there included any portion of the 3 per cent. allowed for reinstatement of worn-out school buildings?—I presume so, although it would be a quite indefinite quantity.

21. How much has the Board of Education to the credit of that fund?—I could not tell you. We have not been asked to get that out.

22. How much do the School Committees of Southland contribute towards education in their own districts?—Some years ago the School Committees contributed almost as much as the Board contributed for all purposes, including prizes, excursions to the sea, and that kind of thing. Some five or six years ago it was shown that something like £1,500 to £2,000 in the aggregate was contributed by the Committees for school purposes.

23. I am not referring to excursions and that kind of thing: I am speaking more particularly with regard to works required to be done in or around the school buildings?—I should say, about £1,200, on which the Board grants a subsidy.

24. You correct your statement and say that instead of £2,000 the people of Southland raised for those purposes from £1,000 to £1,200?—Yes.

25. And the School Committees raised another £800 for certain other things, which money is not subsidized by the Education Board?—Yes.

26. *Mr. Davidson.*] Can you account for the very great increase in the cost of administration by Boards during the last ten years?—I am not aware that the increase has been so very material.

27. I think if you look at the returns you will find it has increased in a much greater proportion than the attendance at the schools throughout the Dominion?—I should say it has been caused by the increased activities to which the Boards are invited to give their attention. Take, for instance, the development of technical education: that must have led to a considerable increase alone. I do not think there has been any increase in the cost per pupil or school so far as the Board's official administration is concerned.

28. I am speaking of the Boards generally. The fact remains that the cost of administration has increased largely during the last ten years. Do you think it is due entirely to increased activities, especially in technical education?—There may be another reason. The officials do not always remain young, and officers who like myself are reaching the retiring-age have had gradual increases to their salaries.

29. The additional work thrown on the Boards during the last ten years would necessitate additional assistance, and in consequence increased expenditure, I suppose?—Yes.

30. Then, about the appointment of teachers, you have only two schools in this district in the two higher grades, 9 and 10?—Yes.

31. There would be great difficulty then, I presume, in teachers attaining to the highest positions in the service within this district?—There is very little chance except by the accident of death or removal.

32. In any case there are only two "plums" in the service in Southland?—Yes.

33. You have one Grade 10 school in this district: how long has the headmaster been in charge of that school?—About thirty years.
